The technology of print by moveable type was invented by Johannes Gutenberg of Mainz in the early-to-mid-1450s and spread widely across western and central Europe in the decades that followed. During that time, the large majority of incunabula (i.e., books printed before 1501) consisted of Roman Catholic theological works, particularly biblical and liturgical texts, editions, and commentaries on the church fathers, medieval Scholastic theology, canon law, and, to a lesser extent, works of personal pious devotion and religious mysticism. While this same concentration of interest was to persist throughout the Renaissance and Reformation periods, the final decades of the fifteenth century were also marked by a substantial increase in classical humanist works, among them many of the printed *editiones principes* of major Roman and Greek philosophical works: Cicero’s *De officiis* (Mainz, 1465); Pliny the Elder (1469); Boethius’s *De consolazione philosophiae* (c. 1471); Macrobius’s *In somnium Scipionis* (1472); Isidore of Seville’s *Etymologiae* (1472); Lucretius’s *De rerum natura* (c. 1473); Seneca’s collected philosophical works (1475); Ficino’s Latin edition of Plato (1484); and Aldus Manutius’s monumental, and at the time, encyclopedic, Greek-language edition of Aristotle (1495–1498).

Aside from Lucretius and Plato, the earliest printed works of classical philosophy mirror much of what was available through the medieval manuscript tradition, particularly from the twelfth century onward. Beginning with the 1465 Mainz *De officiis*, the first classical text in printed form, Cicero greatly predominated among the ancient Roman philosophers in incunabula, by century’s end reaching scores of editions of this and his other major philosophical works, particularly the *Cato Maior de senectute*, *Laelius de amicitia*, and *De finibus* – all of which had also been known to Dante. Cicero was followed closely in overall popularity by Seneca, whose *De clementia* and

De beneficiis survived in hundreds of medieval manuscripts by the era of print. Both were interpreted in orthodox Catholic medieval and early modern manuscript and printed texts as enlightened pagan moral philosophers. They were also invaluable in providing rare Latin-language distillations of ancient Greek philosophy at a time when even seemingly canonical Greek texts remained hard to come by – much as Tertullian and Ambrose were regarded by the patristic period. This indirect textual access to Greek philosophical works extended even to Aristotle, who was perhaps more widely known in the medieval world through Boethius's late-antique translations and commentaries of his treatises on logic than from the Greek philosopher's own textual *Organon*.

As the canon of the Latin scholastic tradition took form, particularly by the thirteenth century, Aristotle's corpus was received almost entirely through Latin translations and commentaries, many of them passed through imperfect Arabic intermediaries. Plato, by contrast, was hardly known at all in medieval Europe but for Calcidius's Latin translation and commentary of the first part of the *Timaeus* and some fairly obscure twelfth-century translations of the *Phaedo* and *Meno*. The appearance of Marsilio Ficino's vast Latin translation of the Platonic corpus – the *Platonis Opera omnia* of 1484, which was immensely improved in the critical second edition of 1491 – all but revolutionized Neoplatonic thought for generations to come. Aldus Manutius's corresponding five-volume Greek-language publication of nearly all of Aristotle's known works, as well as the major works of Theophrastus, Porphyry's *Isagoge*, and Philo's *De mundo* (1495–1498), would do much the same for generations of hyperliterate sixteenth-century neo-Aristotelians.

The duplicative power of print assured a permanent, even exponential, expansion of public awareness, access, and engagement with philosophical ideas. The entire extant manuscript corpus of one of the most common philosophical texts of the premodern world, Cicero's *Cato Maior* on the subject of old age – preserved in several hundred medieval and early Renaissance

manuscript copies – could be entirely outnumbered by the print run of a single edition in the mid-to-late fifteenth century (Conte 1994, 205). Between c. 1467 and 1470 alone at least five printed editions of the *Cato* were published in Cologne, Venice, and Rome, and a further 13 up to 1475, many of them incorporated into anthologies of Cicero's works in Naples, Brescia, Milan, and northward in Paris. The technology of print assured that the subsequent history of philosophy would no longer be circumscribed within rarified princely libraries or the collections of ecclesiastical institutions and elite universities. Renaissance print put philosophy, simultaneously, within the physical, commercial, and imaginative reach of a far broader, literate readership.

This broadening of access was perhaps most significantly achieved through the publication of short, separately printed editions of individual classical philosophical dialogues to be sold as schoolbooks at relatively reasonable prices. Cicero's *Laelius de amicitia* appeared in over 70 incunabular editions, for example, many in schoolbook form. Aldus Manutius continued this tradition by printing standard classical works in inexpensive octavo formats, squeezing large amounts of type onto many fewer pages by deploying a narrow italic type. This savvy printerly innovation significantly decreased the material production and sale costs of books during the late fifteenth and early sixteenth centuries, while also instilling in the minds of generations of readers concepts of humanist *amicitia* and intellectual affinity rooted in broader shared access to classical literature.

The Technology of Print

The everyday enterprise of print was hardly driven by philosophical principles however. The nascent craft, industry, and trade of print by moveable type was constantly constrained by high initial capital investment requirements, most of all for the acquisition of expensive founded metal type and other durable press furniture. The earliest printers – many of whom disappeared or went bankrupt after producing only a handful of

publications – were often vexed by unreliable supply chains and erratic market prices for essential materials such as paper and ink, difficulty in securing and retaining highly skilled labor (e.g., authors, editors and commentators, translators, and proofreaders), in addition to fairly limited formal mechanisms for marketing and distributing their products. Imaginative typefounders and adept punch cutters could invent new and appealing styles of type, creating matrices that, in turn, were reusable long afterward to cast type as needed by their owners. But the materials and industrial process for casting type were also costly, forcing printers to maintain a limited amount of characters on hand at any one time. The intensive physical pressure involved in screw-press printing also wore down the quality of typefaces, requiring their replacement over time. Whatever the state of the economy, printing by moveable type was always a capital-intensive enterprise.

Like earlier manuscript scriptoria, a broad array of skilled artisans, craftsmen, and lesser skilled laborers were required to produce an efficient, marketable, and high-quality physical product. In addition to a foreman or master printer, there were copy editors (many learned in multiple ancient languages), type compositors, hardworking pressmen who undertook the monotonous task of inking and operating the press furniture, and younger apprentices who moved paper and ink stocks around the shop and hung newly printed pages along drying ropes. (These rhythms of protoindustrial production were neatly illustrated in simultaneous, if idealized, operation in the setting of an Antwerp printing shop in Johannes Stradanus's *Nova Reperta* [1600].) Generally speaking, at least two pressmen were needed to keep up the productive cadence and repetitive pace required to churn out hundreds of pages of letterpress each day. An inker would beat the type evenly with ink balls between impressions, while the puller might alternate between laying paper into its proper register inside the press and the physically demanding work of pulling the screw-press lever. Once an assembled page of type was printed up to the designated print run, the composed type would usually be disassembled and

replaced in the appropriate rows of type cases – often capital letters in the “upper cases” and miniscules in the “lower cases.”

Also important to the quality and reputation of any printing house was a literate, and even polyglot, type compositor capable of setting the type (backwards) into separate composing sticks based on a manuscript copy text. Compositors, along with highly literate proofreaders, were often among the better-paid employees in most print shops. Heavily occupied with achieving right justification on a given page, skilled compositors were masters of the subtle manipulation of a copy text. This could be achieved through the addition or subtraction of characters, the introduction of (hopefully accurate) variations in spelling, and the extension or reduction of abbreviations and hyphens. Once the composing stick was filled, the assembled type could be transferred to a tray until the full text of a printed page was arranged, at which point, it was fixed and locked into place in a frame and imposed with other pages, so that when printed, the text would appear in the correct order. Pages were nearly always printed on both sides of a single sheet into corresponding multiples of decreasing size from 2 (folio), to 4 (quarto), 8 (octavo), 16 (16mo), and so on, pages per sheet.

Once the type was so arranged and fixed in the press and inked, each blank page of laid paper (made from rag – vellum was used only rarely in deluxe printing) was dampened prior to printing in order to better receive the ink, then removed and hung up to dry. Errors were sometimes detected after a limited number of pages of type had been printed, incurring costly and time-consuming stop-press corrections. When these occurred, the inferior printed sheets were not always discarded, resulting in significant textual variations even within a single print run. In lieu of, or in addition to, stop-press corrections, more economic errata sheets could be added to the end matter of an imprint, simply enumerating in sequence the mistakes made. These errata sheets may often have been composed by the authors of a copy text eager to protect their reputations, or even to improve their texts as originally written, as was the case, for example, in Marsilio Ficino's translation of

Iamblichus printed by Aldus Manutius in 1497 (Richardson 1999, 16).

Once dry, the printed sheets were later assembled in sequence, folded, cut, and gathered into quires. Prior to the general standardization of foliation (i.e., the same number applied to both the recto and verso of a sheet: 1r, 1v, 2r, 2v, etc.) or pagination (unique page numbers applied to each side of each sheet), the proper sequence of pages in a quire was often set in type as signature marks on the rectos of some sheets (e.g., Ai, Aii, and Aiii) to aid in the correct collation of a text. Front matter (title pages, tables of contents, epistles dedicatory and to the reader, occasional prose and verse approbations, etc.) was often printed toward the end of a book's production and sometimes acknowledged in a terminal register at the end of the imprint, indicating the proper order of the book's various components. Most books were transported to market and sold in unbound folded sheets prior to binding.

Among the greatest early successful printing houses were those of Aldus Manutius in Venice and Anton Koberger in Nuremberg. During its height between 1473 and 1513, Koberger's firm operated as many as two dozen presses and employed more than a 100 employees – from compositors, proofreaders, pressmen, illuminators and rubricators, and even binders – occupied with the printing of over 200 titles (Steinberg 1996). Many of these appeared in large and costly folio formats, including the typographically complex, heavily glossed Koberger Bible (1483), and the so-called Nuremberg Chronicle (1493) with its massive accumulation of some 1800 woodcut illustrations. (Intaglio illustration, whether in woodblock, or later in copperplate engravings and etchings, could add significantly, even exponentially, to the cost of early modern book production.)

The Economy of Print

Most printers met with only periodic success, sometimes punctuated by spates of considerable distress. Such was the experience of the great Antwerp printing house entrepreneur, Christopher

Plantin, who by 1575 may have had some 70 employees simultaneously operating up to 22 printing presses with an estimated capacity to print as many as 1250 sheets for a standard edition in a single day. Renowned for the extremely fine quality of his imprints – in particular, due to his frequent employment of the finest engravers in Europe in the production of his many illustrated books – Plantin fell into great trouble under the demanding attention of Philip II of Spain. The king had commissioned the immensely ambitious, but hardly remunerative, eight-volume *Biblia Regia* (1572), the so-called folio Plantin Polyglot Bible printed in incredibly complex facing-page Hebrew, Latin, Greek, and Aramaic translations. Despite this and other setbacks, Plantin's press continued to thrive well beyond his own lifetime after passing, within his family (as Renaissance printing firms often did), to his scholarly and pragmatic son-in-law Jan Moretus (Voet 1969–1972).

Book publication was fraught in many ways, combining high production costs, market uncertainty, and unpredictable price fluctuations. Characteristic early modern overreliance upon lines of credit, the poor liquidity positions of many printers, and a relative absence of bankruptcy protections, all presented hazards even to the most intrepid entrepreneur. Threats of competition between stationers, even within a single municipality, left many a printer packing, often relegated to diminished careers of itineracy. A majority of a city's printers might fall subject to a relatively small number of well-capitalized and socially connected publishers, and an even more elite circle of potential patrons from the princely and patrician classes. The often fickle tastes of the reading public could leave hundreds of copies of an imprint unsold for years, even decades, inspiring the hopeful and desperate alike to dress up warehoused stock with freshly updated title pages (Pettegree and Graheli 2019).

Added to these daunting financial considerations were the customary economic vagaries of the early modern marketplace: rapid price inflation, high taxation and import duties, currency fluctuations and devaluations, crop failures, epidemic disease, and dynastic wars and succession

struggles, among others. On the other hand, there was much that helped to fuel and promote the printing trade, even in seemingly esoteric philosophical works, such as technical innovations in roman (versus gothic) and ancient Greek typography, as well as the fairly sudden appearance of little-known classical works in the Latin-reading world – not least the introduction of nearly all of the Platonic corpus during the 1480s. These innovative developments both spurred and reflected emerging secular and ecclesiastical traditions of literary patronage around humanistic scholarship, as classical philosophical knowledge took on renewed prestige in princely and episcopal courts at Florence, Paris, Cologne, and elsewhere. These political advantages would extend, over time, to printers and publishers. Increasingly effective market protections were introduced through conventionalized contractual systems within municipalities and broader jurisdictions. Increasingly centralized systems of licensure and trade privileges developed, particularly during the sixteenth and early seventeenth centuries, alongside the incorporation of specialized guilds of printers and stationers.

The enduring value of canonical works – the Bible, books of canon law, liturgical texts, or editions of certain ancient or medieval authors – may have held out the promise of relative security. These were often prudent investments for a sole publisher, even more so for a well-coordinated cartel, satisfied by the expectation of future returns on their investments through a predictable volume of sales over a reasonable period of time. The materials and labor expenses required for a book's publication could just as well have been undertaken by its author, or mutually by an author and publisher, in contractual agreements enumerating percentages of the cost of production in return for agreed upon numbers of copies, or possible shares in profits from sales. Joint contracts could vary considerably, and it is just as important to appreciate that a printer, publisher, and bookseller could also be one and the same person.

Single publishers with bookselling and export interests in a title might be willing to assume all printing and materials costs in exchange for

exclusive rights to sales. A consortium of investors could pool resources to ameliorate individual exposures to risk, bringing together members of the literate and monied classes – university professors, doctors and lawyers, courtiers and gentry, wealthy urban merchants, rich guildsmen, et al. Such groups might join forces toward a reasonable expectation of how a particular learned work might align with prevailing institutional cultures, intellectual fashions, and readerly tastes. Prudent investments in a certain number of specially embellished presentation copies (e.g., fine bindings with decorated clasps, gilt pages, and hand-colored title pages) could help pave the way for popularity and success in especially remunerative ways. While profits could be considerable, failures could be just as spectacular, as many early modern presses went into and out of business after producing but a handful of titles. Alternatively, aspiring or enterprising authors might simply hire jobbing printers at cost to work on limited, one-time commissions and fees. Many, perhaps most, early modern authors and editors of printed books who did so are known today only through single titles.

Determining the proper number of copies in a single print run often involved a complex formula of upfront acquisition and production costs, estimated sales, transportation expenses to market (including export tariffs, duties, and fees to middlemen), and longer-term warehousing of unsold stock. The earliest printed books in Germany and Italy seem generally to have been printed in small runs of perhaps 100–200 copies, though the absence of solid evidence, and inconsistencies in incunabular survival rates, suggests that the numbers could have been higher in some cases. As Venice emerged as the major southern European center of printing and bookselling during the 1470s and 1480s, print runs may have risen to about twice that number, perhaps 300–400 copies per title on average. As many as 1000 copies in a single print run may have appeared in the case of certain editions of the Bible, legal texts, or popular literary works, though the upper end of the production scale seems rarely to have exceeded 1000 or 1250 copies at any point in the sixteenth century (Grendler 1988). Still larger print runs appear

quite exceptional at any time or place in Renaissance Europe, even in the case of best-selling vernacular works, whether they be Luther's perennially reprinted German translation of the Bible, or Ariosto's runaway literary bestseller, *Orlando Furioso*.

Print runs counted for only one part of the total cost structure of books. During the first decades of printing, manuscript books may not have been vastly more expensive than some incunabula, especially in the case of large-format folio imprints requiring sizeable amounts of costly paper and complex typographical arrangements. General prices for imprints declined more significantly by the later fifteenth and early-to-mid-sixteenth centuries, though sumptuous works of special magnificence such as the Aldine Aristotle (1495–1498) might command the princely purchase price of 11 ducats – the rough equivalent of perhaps 10–20% of an average university lecturer's annual salary. Far more modest prices prevailed by the middle decades of the sixteenth century, particularly for vernacular texts and imprints produced in smaller formats. To save money, many a Renaissance book buyer simply delivered to a binder a miscellaneous group of inexpensive publications separately printed in a standard quarto or octavo format, requesting that they be bound up together into a single *Sammelband* (composite volume).

Print Patronage, Politics, and Law

The direct patronage of wealthy families and aristocrats, and their prestigious association with the intellectual work of a rising or distinguished scholar, could play an instrumental role in the successful publication of almost any Renaissance book – even the most rarified philosophical monographs, editions, or commentaries. Flattering dedicatory letters could represent the author's aspirations to future financial gifts, lucrative court sinecures, or princely pensions rather than thanks for the actual underwriting of the book in question. Philosophers like Marsilio Ficino, who received personal gifts of properties at Florence and Careggi from Cosimo de' Medici, also

implicitly relied on the support of a range of wealthy and influential patrons to subvent the costs, and influence the contractual negotiations and commissions, involved in the publication of their works in manuscript and print. In England, the royal printer Thomas Berthelet received a 4-pound annuity after his appointment by Henry VIII between 1530 and 1547. In addition to the profitable right to print all royal proclamations and statutes of the realm, Berthelet went on to publish all of the scholarly works of the humanist Sir Thomas Elyot. These included Elyot's popular work of political philosophy, the *Boke named the governour* (1531), as well as his prestigious, and likely lucrative, Latin-English dictionary (1538), which was the first of its kind to appear in print. Both works were dedicated to King Henry, and in the latter, Berthelet explicitly reproduced in the front matter the terms of his exclusive royal privilege to reproduce Elyot's 424-page folio dictionary over the ensuing 6 years “cum privilegio ad imprimendum solum” (Pantzer 2008).

Princes of the Roman Catholic Church were another source of such patronage, as were the upper ranks of Reformed ecclesiastical authorities throughout much of Protestant Europe. The names of individual popes, cardinals, bishops, and wealthy abbots that adorn the dedications of Renaissance religious and philosophical imprints are legion. Even the most controversial philosophers could enjoy the protection of such men. In an *apologia* printed in 1518, the controversial neo-Aristotelian Pietro Pomponazzi defended his *Tractatus de immortalitate animae* against the refutations of his former student, the future cardinal Gaspare Contarini. The philosopher dedicated this work to another of his former pupils, Ercole Gonzaga, a prince of Mantua who would later become a bishop, cardinal, and eventually a papal legate to the Council of Trent. In the same year, a third former student, Cardinal Pietro Bembo, then papal secretary to Leo X, intervened over threats of heresy proceedings against the philosopher, assuring Pompanazzi vindication through the renewal in 1519 of his contract to teach at the University of Bologna, then the leading academic center within the Papal States (Pine 1986).

Absent any established or easily enforceable system resembling copyright, the legal conditions surrounding printed-book production and book-selling are not dissimilar to those applied to other artisanal trades. Beyond bibliographical information preserved in early modern imprints themselves, archival evidence of particular legal aspects of the print trade generally survives in the form of contractual documentation and records of legal proceedings. The latter were usually produced in conjunction with secular municipal and guild authorities, law courts, or ecclesiastical consistories, depending on the particular printing center and its jurisdictional practices. Authorized contracts, and privileges granted and enforced within these jurisdictions, imposed some measure of legal relief for commercial violations. Proceedings often began with particular petitions and suits for violations, where they could be detected and the offending parties properly identified. Successfully, adjudicated cases frequently involved the payment of fines and other punitive sanctions such as the confiscation of imprints or the destruction of the offending printer's lead type. Payments often occurred at a negotiated rate or through schedules of fines, which were usually set at prohibitive levels to deter illicit printing in the first place.

Comparison of the printed output of a municipality with formal registers of authorized titles, such as those maintained by London's Stationers' Company, reveals that many imprints were nonetheless printed and sold outside of prescribed channels. The admixture of regulatory authority, competitive self-interest, and instances of illicit connivance or corruption may have contributed to haphazard enforcement in almost any early modern commercial guild structure. These are certainly apparent in the career of the London underground printer John Wolfe, who was accused of actively violating the privileges granted to members of the company throughout the early-to-mid-1580s. Though he was not yet a member of the Stationers' Company, a formal complaint against him was presented to the guild in 1583. Despite promises of reconciliation, Wolfe resisted subjecting himself fully to the discipline of the company through translation of

membership and was repeatedly jailed, until a raid on his shop revealed five presses, two operating "in a secret vault." His translation to the company soon thereafter did not forestall further controversy over privileges held by successful stationer John Day, to whom Wolfe was formerly apprenticed for 10 years. Remarkably, a few years later, the obstreperous Wolfe was appointed to the office of beadle in the Stationers' Company – a role he assumed with zeal for years, most of all in the detection and prosecution of other illicit printers in London (Gadd 2004).

During the early modern period, legal privileges and contracts among printers and publishers were generally enforceable only within a given jurisdiction, whether limited to a municipality, state, or kingdom. Securing licenses or legal recourse beyond one's home jurisdiction often required further petitions, suits, and fee payments. Negotiations over the sale of books through export-import were often negotiated informally or contractually between printers in different cities, or even through incorporated associations active within different municipalities. More exceptional models, such as the far-flung Giunta Press, which had offices and business interests emanating outward from Florence to Rome, Venice, Lyon, Burgos, Madrid, and elsewhere, allowed for a more closely coordinated system of distribution and sales. The Giunta often specialized in Latin-language imprints of broad scholarly and ecclesiastical appeal from the late-fifteenth to the early-seventeenth centuries. Among their more important early imprints was the first Latin translation and commentary from the original Greek of Ptolemy's *Almagest* (Venice, 1528) by George of Trebizond and Luca Gaurico (Pettas 2012). The business records of particular Renaissance printing houses are far less well preserved. The most notable exception, by far, is the archive of the Officina Plantiniana in Antwerp, which preserves thousands of ledgers, individual financial and trade documents, and the cosmopolitan and polyglot correspondence of Christopher Plantin and his heirs from the mid-sixteenth to the mid-to-late seventeenth centuries, now held by the Platin-Moretus Museum (Voet 1969–1972).

In the absence of copyright, particularly popular books of the Renaissance were often pirated and reprinted widely without commercial advantage to the authors, printers, or publishers of their editiones principes. The diplomat Baldassare Castiglione's massively popular international bestseller *Il cortegiano* (Venice, 1528) appeared in nearly a 100 editions within 50 years, the first 11 printed exclusively in the original Italian vernacular. Though Castiglione himself had been active in the contractual negotiations with the Aldine Press in 1528, and likely paid for as many as 150 copies – many fine and deluxe presentation copies for his friends, princes, and dignitaries – his death the following year precluded his receiving much remuneration from the venture. Nor is it at all clear that its original printer, the house of Aldus Manutius in Venice, profited at all from the proliferation of editions beyond its original four (1528–1545), including the Giunta Press's six Florentine editions and Viotta's three printed in Parma. *Il cortegiano* appeared in quick succession in Barcelona (1534), Lyon and Paris (1537), Toledo (1539), Salamanca (1540), Medina del Campo and Seville (1542), and Antwerp (1544). A later wave of foreign editions came to press in Saragossa (1553), London and Wittenberg (1561), Munich (1565), Valladolid (1569), and Strasbourg (1577). Translations of the Italian original generally follow the same pattern of migration, such that by 1534, it was first translated into Spanish, then French (1537), Latin and English (1561), and German (1565). Though generally a production of aristocratic court culture, the culmination of Castiglione's dialogue, delivered by the character of Pietro Bembo recapitulating the many of the virtues of Platonic love outlined in the *Symposium*, may well constitute one of the most widely circulated, quasi-philosophical works of the entire sixteenth century (Burke 1995).

Frequency and geographic diversity of reprints of a given book such as Castiglione's are generally taken by scholars as evidence of its popularity. While useful both from a cultural and commercial perspective, subjective measures of popularity must be treated with some caution. Certain classes of material, such as official government

documents (statutes, royal proclamations) or ecclesiastical publications (papal bulls, encyclicals), were normally printed by decree and often under monopoly rights. Alternatively, sensitive political controversies or religious polemics were always especially vulnerable to forms of official suppression, and punishing legal sanctions could often affect their printers or booksellers far more appreciably than their often anonymous or pseudonymous authors. Trade in books with false or misleading colophons indicating publication elsewhere and inaccurate dates of publication remained brisk throughout the early modern period, driven equally by partisan zeal, calculated profit motives, and political necessity. After the Protestant Elizabethan Settlement in England, nearly 2000 titles written, translated, edited, and published by and/or about English Catholics were printed licitly on the European continent – particularly in northern France and the Spanish Netherlands between 1558 and 1640. Many of these were smuggled into England or otherwise printed on secret Catholic domestic presses operated by lay Catholic enthusiasts and underground Jesuit missionaries (Allison and Rogers 1989–1994).

Press Censorship

Evidence of organized press censorship, both secular and ecclesiastical, is fairly rare prior to the early years of the Protestant Reformation, and large-scale efforts toward the suppression of heterodox or potentially seditious imprints generally did not appear until the mid-to-late sixteenth century. Still, ecclesiastical, even papal, interventions in Renaissance philosophical publication and discourses were not unheard of prior to Luther; arguably, the most famous case was that of the celebrity nobleman and visionary syncretic philosopher Giovanni Pico della Mirandola. His plan to convene a heroic, pan-European conference in Rome in 1487 at which he would defend a seamless synthesis of Christian revelation, magic, and kabbalistic exegesis was quashed by Innocent VIII after the appearance in print of the philosopher's provocative *Conclusiones philosophicae, cabalasticae et theologicae*

(1486). His introductory “Oration on the Dignity of Man” appeared somewhat defiantly in a published *Apologia* (1489) and, later with editorial interventions, in his nephew Gianfrancesco Pico della Mirandola’s *Commentationes* (1496) only after Giovanni Pico’s personal reconciliation with Pope Innocent’s successor, Alexander VI (Copenhaver 2019). Secular Aristotelians who had argued for the mortality of the rational soul drew further papal censure at the Fifth Lateran Council, inspiring the promulgation of the papal bull *Apostolici regiminis* (1513), which enjoined philosophers to clarify and defend Catholic orthodoxy no matter their arguments. This obligation did not prevent Pietro Pomponazzi’s proposition of the materialist dependence of the soul on the mortal body in his *Tractatus de immortalitate animae* (1516), nor his vindication from threats of ecclesiastical censure by ecclesiastical allies, which he answered in a decidedly unapologetic *Apologia* (1518) and subsequent *Defensorium* (1519).

Pomponazzi’s personal vindications could not forestall the future condemnations of radical philosophers within the pages of the ever-expanding *Index librorum prohibitorum*, however. Various indexes of banned books had been published by ecclesiastical and university authorities across Catholic Europe throughout the 1540s and 1550s in Paris, Louvain, Milan, Toledo, and elsewhere, culminating in the first Roman *Index*, issued by Paul IV, and the first substantial separate Spanish *Index*, in 1559. These publications would emerge in subsequent decades as powerful, if also largely aspirational, instruments for the correction, expurgation, suppression, or destruction of books deemed erroneous or heretical by the Holy Office of the Inquisition. Actual enforcement was hardly monumental; greatest attention was applied to works of theological controversy, and most of all to the infiltration into Catholic lands of explicitly Protestant texts. Philosophy was hardly immune from this mode of ecclesiastical censure, however, as was exemplified by the nearly 7-year travail of the radical anti-Aristotelian and Hermeticist Giordano Bruno at the hands of Venetian and Roman inquisitors. Vacillating between positions of willing abjuration and principled recalcitrance, he was finally condemned for heresy, his

publications summarily banned, and burned alive at the stake in Rome’s Campo de’ Fiori in 1600.

The perceived danger posed by Protestant publishing centers beyond the reach of enforcers of Catholic orthodoxy was a real one. Several of Bruno’s most controversial philosophical works, including his *De l’infinito, universe e mondi*, were printed in the Italian vernacular during his temporary exile in England between 1584 and 1585. Printers at Basel, Frankfurt, and elsewhere continued to publish the works of controversial scholars and philosophers of the Catholic world who had been added to the *Index* only retrospectively or posthumously, among them Lorenzo Valla and Girolamo Cardano. An eclectic mix of many of the most prominent philosophers of the seventeenth century, Catholic and Protestant, ended up being censored or banned outright in the *Index*, including Jean Bodin, Michel de Montaigne, Petrus Ramus, Justus Lipsius, Francis Bacon, René Descartes, Hugo Grotius, and Thomas Hobbes.

Countless examples of the enforcement of this Inquisitorial censorship are preserved in libraries across Catholic Europe in the form of manually expurgated printed books; so too, however, are petitions and licenses to read prohibited books granted by officers of the Holy Office to its agents and subsidiaries, as well as temporary privileges to scholars and lay readers. Regardless of this patchwork system of limited licensing, extant early modern library inventories from across Catholic Europe abound in titles and authors that had been banned by the *Index* (Marcus 2020). Systematic prosecutions and decisive seizures of illicit, underground imprints were generally exceptional rather than the norm, in Catholic as well as Protestant lands. Interdicts of radical philosophical works, such as those issued against Baruch Spinoza in the Reformed Dutch Low Countries, were regularly skirted by enterprising printers through the deployment of false colophons and anonymous or pseudonymous title pages.

Renaissance Philosophy in Script and Print

Though numerous examples of the printing of Renaissance philosophical texts are provided

above, a closer look at the particular, and sometimes peculiar, characteristics of this subject matter is merited. The humanist turn to ancient Greek philosophy flourished simultaneously with the early introduction of the technology of print by moveable type. As a result, the publication of Greek-language editions of these works was instrumental in the advent and progress of Greek printing throughout Renaissance Europe, particularly between c. 1480 and at least to the 1560s. The steady demand both for philosophical texts throughout that period and for patristic theological works that synthesized elements and schools of ancient Greek philosophy also contributed to the production of widely accessible and reliable Latin translations well into the early seventeenth century. While philosophical texts were not often among the most sumptuously produced or heavily illustrated genres of Renaissance imprints, applied works of natural philosophy nearly always stood at the cutting edge of early modern graphic design and intaglio illustration.

The history of Renaissance philosophical print publication of course also reflects the broader intellectual fortunes of Renaissance philosophical discourse and was thus marked by both continuities and innovations. Medieval Scholastic texts emphasizing Aristotelian logic and metaphysics were a mainstay of university curricula throughout the early modern period. Often controversial neo-Aristotelian debates attracted scores of Renaissance authors, critics, and commentators in print – from the Catholic Florentine humanist and ambassador Donato Acciaiuoli's glosses on the *Nicomachean Ethics* (1464) and *Politics* (1472), to the Protestant medical doctor and Basel academician Theodor Zwinger, who published commentaries on the same in 1566 and 1582 respectively (decades after Zwinger worked in a Lyon printing shop during his student years there).

By contrast, sophisticated schools of Neoplatonic thought and print production popped up in different places at different times. As is well known, from the mid-to-late fifteenth century, the so-called Florentine "Platonic Academy" gathered under the auspices of Marsilio Ficino and others. Much later, a similar cadre of like-minded "Cambridge Platonists" published a host

of philosophical works during the middle decades of the seventeenth century, among them Henry More, Ralph Cudworth, and several of their academic colleagues. Individual works such as the ancient skeptical treatises of Sextus Empiricus were known to seminal Quattrocento humanists and book collectors, such as Cardinal Bessarion, and were repeatedly referenced in the popular published correspondence of Francesco Filelfo. It was not until the period of the French Wars of Religion during the later sixteenth century that Pyrrhonism would begin to have its fullest impact, particularly through the *Essais* of Montaigne (1580). The first printed edition in Greek of the major works of Sextus's corpus would not appear until 1621 (Florida 2013).

Anthony Grafton has usefully characterized the availability of classical philosophical works in scribal and printed forms as falling within four main periods during the late medieval and early modern periods. (1) 1390–1420 marked a period of early humanist textual recovery among book hunters and avid collectors such as Coluccio Salutati and Niccolò Niccoli, as well as fresh Latin translations of some ancient Greek texts. (2) 1440–1470 introduced large-scale translations and commentaries of more technical and applied works of Greek philosophy, among them Ptolemy's *Almagest*, the *Corpus Hermeticum*, and the bulk of Ficino's work on the *Platonis Opera omnia*, as well as portions of his *Theologia platonica de immortalitate animarum* (later printed in 1482). (3) 1490–1530 was dominated by the contributions of the scholar-printer Aldus Manutius, whose press produced the editiones principes of many of the classical Greek philosophical authors known up to that time. His successors at the Aldine Press would continue to publish the works of Galen and other important Greek commentaries on Aristotle. (4) 1550–1580 constituted a period of consolidation marked by the appearance of numerous accessible, high-quality Greek philosophical works, including bilingual editions and translations, most importantly from the Paris and Geneva presses of Robert Estienne and his sons. This last period also saw the emergence of a fresh and lively monographic literature on the history of philosophical thought, inaugurating further efforts

during the late sixteenth and early seventeenth centuries that helped codify the classical philosophical canon within a more precise chronology and critical framework (Grafton 1988).

Philosophical Book Illustration

The large majority of traditional philosophical imprints from the Renaissance were not major milestones in the history of graphic design. Following medieval traditions of manuscript illustration and illumination – such as the cosmological diagrams that often appeared in Calcidius’s translation and commentary on Plato’s *Timaeus*, and in Macrobius’s gloss of Cicero’s *Somnium Scipionis* – Renaissance imprints in the areas of astronomy, geography, natural history, and medicine were quite commonly endowed with sophisticated intaglio illustrations, from simpler woodcuts to detailed copperplate etchings and engravings. The illustrated publication and vast expansion of Dioscorides’s ancient herbarium by Pietro Mattioli appeared and reappeared throughout the middle decades of the sixteenth century. Most notable, however, may be the vast 1562 edition, the so-called Grand Mattioli, which greatly advanced the postclassical study of botany through its hundreds of virtuosic and incredibly detailed woodblocks, produced at the imperial court in Prague. Similarly, the first printed work to illustrate human anatomy based on direct observation appeared in Giacomo Berengario da Carpi’s *Commentaria cum amplissimis additionibus super Anatomia Mundini* (1521). This thick quarto endowed with 21 full-page woodcut illustrations was quickly surpassed by the exquisitely detailed folio engravings of Andreas Vesalius’s monumental *De humani corporis fabrica* (1543) – arguably one of the most revolutionary illustrated books of the entire Renaissance. Later exemplary anatomies provided students of medicine with ingeniously arranged, superimposed sequences of folding illustrated flaps, among them the second London edition of Thomas Geminus’s *Compendiosa totius anatomiae delineatio* (1559) revealing the internal organs of a man and women seated side by

side, and Georg Bartisch’s pre-Vesalian representation of layers of the human brain and eyes (1583).

Dynamic moveable calculators, or “volvelles,” comprised of layers of imprinted heavy paper illustrations individually cut out, superimposed, and sewn and glued together into the pages of books, often appeared in practical astronomical tracts such as Petrus Apianus’s *Cosmographicus liber* (1524) and *Astronomicum Caesareum* (1540). These could be put to work to calculate the movements of the stars and planets, illustrate the phases of the moon, or determine one’s position relative to the earth’s latitude. Galileo utilized special methods of super-precise copperplate etching engravings to illustrate empirically the movement of sunspots newly spied through his telescope in the *Istoria e dimostrazioni intorno alle macchie solari* (1613). Imaginatively illustrated and ever more complex terrestrial and celestial atlases were also printed throughout the Renaissance, variously reflecting the cosmological systems of Ptolemy, Copernicus, Tycho Brahe, and Kepler, many of which are preserved in luxuriously hand-colored copies. Illustrated globe gores, projected mathematically and printed to scale, were designed as ephemeral cutouts to be adhered to orbital supports of a corresponding diameter starting the famous circa 1507 gores of Martin Waldseemüller, which were the first of their kind to depict the newly discovered American continent in woodcut.

Except for title-page illustrations – particularly imagined galleries of ancient philosophers such as that engraved for Conrad Heresbach’s monumental edition of Strabo (1523) – early modern philosophical imprints otherwise seem rarely to have been illustrated in any significant degree. Memorable, bespoken engraved allegorical title pages appeared more frequently during the early-to-mid-seventeenth century in philosophical imprints, such as the iconic ship sailing between the Pillars of Hercules in Francis Bacon’s *Novum organum* (1620), the three interlocutors of Galileo’s Copernican *Dialogo sopra i due massimi sistemi del mondo* (1632), and the multi-layered vision of the body politic in Thomas Hobbes’s *Leviathan* (1651). Separate large-scale

engraved philosophical allegories were also sold and circulated as separate prints, from Albrecht Dürer's famous *Melancholia I* (1514) to entire philosophical programs, such as the elaborate series of mnemonic "thesis print" broadsides conceived by the Franciscan professor of philosophy at Paris, Martin Meurisse (1614–1618). Though exceptional, these fascinating prints encapsulated for Meurisse's students grand summaries of logic, metaphysics, and natural and moral philosophy. Each presents in minute and often dizzying detail complex combinations of allied symbolic and textual information about these separate philosophical themes (Berger 2017).

The humbler appearance of most Renaissance philosophical imprints by no means suggests that they were relegated to a less prestigious position among the wider contents of major early modern libraries. Many of the great Renaissance libraries also included particularly deluxe, even specially commissioned, presentation copies of printed philosophical works. Girolamo de Cremona's magnificent colored border images depicting Aristotle and Averroes in disputation on the title page of the Morgan Library's Torresanus and de Blavis Aristotle (1483) are printed on parchment in royal folio format. It richly reflects a tradition of deluxe philosophical printing that persisted well into the sixteenth century. Especially fine, costly, and esteemed printed philosophical books could be made more visually appealing across many different "price points" for potential buyers. The least expensive forms of this colored finishing work might simply include additions by rubricators and flourishers, while the more costly labors of hand colorists, illuminators, and specialist miniaturists could add considerably to the overall price of a customized or specially commissioned imprint – whether for purchase by a bibliophile or by a rich institution, or for presentation to an intended august recipient. At the same time, it is important to note that, much as often serial repair and "improvement" of original and early bindings was necessary over time, so too could hand coloring and other visual enhancements be added long after a book was first printed.

The relative prestige of philosophical works is also indicated within the implied hierarchies

applied to them in the earliest major printed institutional library catalogues, such as the *Nomenclator* (1595) of the Leiden University Library, given memorable visual form by Johannes Woudanus in an engraved bird's-eye portrait of the library itself in 1610. Atop each freestanding book press, the artist superimposed the subject to which it was dedicated. "Philosophi" appears just after "Theologi" and "Literatores" and was granted a measure of intellectual priority above the more applied disciplines of mathematics, law, medicine, and history.

In whatever its manifestation with respect to other learned discourses, the enterprise of Renaissance philosophy was conducted in and fundamentally dependent upon the material production, circulation, and consumption of physical artifacts – namely, the early modern information media of the written and the printed word. Without the means to reproduce philosophical codices in reliable but also increasingly efficient and cost-effective ways, it is difficult to imagine how the history of Renaissance philosophy could have proceeded quite as it did over the course of the fifteenth, sixteenth, and early seventeenth centuries. Much the same might be said of the Scientific Revolution, or, for that matter, the Protestant Reformation, or the dissemination of wonders emanating from the Americas following the discovery of the New World.

Above all, the multiplicative power of print in classical and postclassical vernacular languages coincided with, but also fundamentally shaped and transformed, one of the most momentous periods of textual revival and philosophical debate in the West. In this sense at least, the study of the history of Renaissance philosophy must be situated not only in the progress and regress of abstract ideas and schools of metaphysical thought, but also within the very concrete physical realm of scribal and print culture where those ideas were first recorded and disseminated, transacted, and preserved. A substantial majority of philosophers and humanists who were engaged in the production or editing of philosophical works during the Renaissance lived squarely within the limitations and possibilities presented by those material realities. Much like scholars

who operate within the challenging realm of academic publishing today, Renaissance philosophers would have been keenly aware of the complexities, hard-nosed financial negotiations, and commercial constraints that governed their ability to communicate their philosophical ideas and intellectual priorities to the wider world.

Books of Secrets: Renaissance

Ruben Celani

Department of Literary Studies, Faculty of Arts and Philosophy, Ghent University, Ghent, Belgium

Abstract

In the mid-sixteenth century, the literary genre which came to be known as “books of secrets” arose to become an international and long-lasting success. The features and *topoi* displayed in these books mirror some of the most important social, cultural, and scientific developments between late Renaissance and early modern period. Their authors crafted the *persona* of a restless seeker of secrets, walking the world and open-mindedly engaging with it, which was particularly appealing in an era of geographic discoveries and explorations. Spreading techniques and remedies alongside natural marvels, books of secrets participated in the late Renaissance reappraisal of artisanal knowledge, as well as the dissemination of natural philosophy within a broad audience. Taking full advantage of the mass medium of print, they promoted the circulation of technical, medical, and natural knowledge across the social ladder, attracting readers from the court to the *piazza*. The study of this literary genre has recently provided precious insights into the role of domestic households, courts, workshops, and markets in the history of medicine and science. For a brief but deeper discussion on this topic, see William Eamon’s contribution (forthcoming) on the *Encyclopedia for Early Modern Philosophy and the Sciences* (Springer).

Books of Secrets in Context

The category of “books of secrets” commonly refers to a literary genre widespread throughout sixteenth- and seventeenth-century Europe. It defines collections of medical prescriptions,

technical and alchemical procedures (e.g., distillation), tricks, and natural marvels. Although it is difficult to draw precise boundaries, books of secrets share a set of common features: the recipe form in which secrets are reported, the tendency to choose the vernacular over Latin, the variety of subjects addressed, and a major use of rhetorical and narrative strategies. These features enabled the targeting of a broad, predominantly urban audience, now reachable throughout the mass medium of print, which led to the production of small-sized (mostly *in octavo*) and relatively affordable volumes. Indeed, it has been pointed out that printers and polygraphs played a crucial role in the crafting and distribution of many titles of this genre (Eamon 1994a; Kavey 2007; Gulizia 2014).

While these books might vary in structure (from sizeable collections of mere, unordered recipes, to more selected *corpora* of secrets, carefully organized and explained at length), the methodology remains the same: their authors declare the superiority of experience and observation while enhancing a skeptical approach toward bookish learning and established authorities. They provide endless examples of this approach, often revealing multiple secrets for the same goal and always declaring to have tested their efficacy.

These claims partly served the authors' (self-) fashioning, as the act of revealing secrets was a display of the author's mastery in crafts and understanding of nature (Eamon 2011). Self-promotion strategies were also functional to increase sales and to gain the favor of wealthy patrons (Eamon 1991). Furthermore, in many cases textual tradition was still a source of authority alongside firsthand experimentation (Smith 2011: 58). Careful to establish their own authority, some authors would even discourage experiments, urging the reader to rely solely on their expertise. Nonetheless, the emphasis on practice was not purely rhetorical nor isolated; it mirrored the bodily engagement with nature typical of artisans and practitioners (on which see Smith 2004), an approach increasingly popular in the Renaissance (as the many contemporary technical treatises and how-to books suggest). Even when their authors discouraged experimentation,

the prescriptive character of recipes called for the readers to take action; whether these replicated or adapted the recipes, they were still engaging with nature (Eamon 2011; see also Eamon 1994a: 126–133). Moreover, by endorsing the idea that nature's secrets were accessible through observation and hands-on experience, these books might have genuinely solicited a more experimental attitude in their readership, regardless of the authors' intentions (Eamon 2011; Kavey 2007). They also bore a social and economic value, allowing readers to become sharper consumers in the late Renaissance "mixed medical economy" (Leong and Pennell 2007: 144).

As repositories of artisanal and natural knowledge, books of secrets satisfied a growing desire for understanding and possessing nature. Such desire was nurtured by the expansion of geographic and commercial spaces, which made novelties and exotic specimens increasingly available on the marketplace. This fostered the exchange of scientific information within courtly and commercial environments (Cook 2007; Smith and Findlen 2002; Findlen 1991), the formation of transnational scientific communities, and the creation of collections of *naturalia* and *automata* (see Marples and Pickering 2016 for a recent survey of the vast scholarship on this phenomenon). Participating in this widespread culture of collecting, books of secrets entered libraries and cabinets of curiosities belonging to *virtuosi*, scholars, and practitioners (Eamon 2008; Findlen 1994: 212); in a way, they too can be considered virtual museums, "a sort of theatre in print" (Gulizia 2014: 18).

Just as real *wunderkammern*, books of secrets also gathered bizarre phenomena and anomalies, even teaching how to replicate (or simulate) them. They satisfied an increasing demand for the inexplicable, often associated with the pleasure of having it explained (Stabile 2006: 504). In the early modern period, this taste for wonders converged with the re-evaluation of curiosity, a distinguishing feature of the new natural philosophy (Daston and Park 1998: 303–328). Marvellous phenomena became objects of scientific inquiry, which (as natural magic advocated) could even allow an insight into the web

of correspondences pervading nature (Verardi 2018: 96–103); but they were also sources of entertainment (*diletto*). Often reported in form of anecdotes, they participated in the narrative strategies and in the “rhetoric of the prodigious” (Policardo 2006: 437) that characterized books of secrets.

Impact and Legacy

The abovementioned cultural mind-set boosted the European fame of authors as diverse as the likely fictitious Alessio Piemontese (1555), the histrionic doctor Leonardo Fioravanti (1561, 1564), and the Neapolitan nobleman and *magus* Giambattista Della Porta (1558, 1589). The same mind-set also inspired the first, albeit scarcely documented, scientific academies that were established in Naples: the *Accademia dei secreti*, founded by Della Porta himself (Eamon 2017), and the *Accademia Segreta*, described by the polygraph Girolamo Ruscelli (1567; see Eamon and Paheau 1984).

Alessio Piemontese’s *Secreti* (1555) was the first and unmatched international best seller of this genre. It inspired many similar works (see Eamon 1994a; Rizzardini 2009; Ferguson 1959), some of which were still being reprinted in the eighteenth century. Furthermore, Alessio’s *persona* set the prototype for a new profession, that of the “wanderer searcher after the secrets of nature” (Eamon 2011: 25): three decades later, the friar Tomaso Garzoni (1585: 183) would name him and his followers “professors of secrets.” Their success affected both popular and learned culture: on the one hand, they inspired charlatans to compile and peddle their own booklets of secrets (about these *professorini di secreti* see Eamon 2013, 1994a: 234–266 and appendix; on charlatans, see Gentilcore 2006); on the other hand, they became sources for Johann Jacob Wecker’s extensive Latin encyclopedia of secrets (1582). In fact, both Wecker and Garzoni (1589: 184) enlisted the new “professors” alongside classical and medieval authorities, embedding sixteenth-century works within a continuous quest for natural knowledge.

Books of secrets have been addressed by modern historiography since the late nineteenth century (see Ferguson 1959), but their role in the history of science has become clearer only in the last decades. In particular, William Eamon has suggested that these books promoted the ethical superiority of publicity, and therefore endorsed a transition from the esoteric medieval tradition to the open communication upheld by early modern “new philosophers” (Eamon 2006: 232). However, publicity was also a *topos* widely exploited by professors of secrets as part of their self-fashioning. Moreover, the open availability of a secret (which in these texts stood for “technique,” “recipe”) did not correspond to the abandon of secrecy as a social practice *tout court* (Vermeir 2012, who also argues for an understanding of secrecy and openness as entangled, not oppositional concepts). To disclose secrets was also a way to exert control over their dissemination and did not necessarily mean to relinquish the artisanal expertise on their preparation (e.g., complex technical procedures, when revealed, still needed craft-manufactured instruments; see Jutte 2015: 14).

Although their stance of openness was nuanced and performative, books of secrets may have helped in redefining the object and methodology of the scientific inquiry. Eamon relates this event to a specific connotation of “secrecy” which he calls *epistemic* (1994a: 11). In this sense, secret did not mean something willingly hidden nor intrinsically unknowable; it rather indicated something only contingently unknown (e.g., the virtues of American herbs were unknown to Europeans before the discovery of the New World). Therefore, observation, exploration, and engagement with nature could lead to their unveiling. Moreover, books of secrets conveyed a perception of nature’s secrets as “mechanism hidden beneath the exterior appearances of things” (Eamon 1994a: 297). The contingent, mechanical nature of secrets enhanced a new epistemology: the “hunt,” a search for new objects and phenomena, now prioritized over the demonstration of the already known (Eamon 1994b). This *venatio* required a kind of practical sagacity that benefitted concrete action over

abstract reflection, proceeded by clues and was opened to experimentation. Professors of secrets applied (or at least exhibited) this approach, which was later embraced by Francis Bacon and became a paradigm of the new sciences (Eamon 1994a: 285–291).

In a broader sense, which includes (but is not limited to) the literary genre started by Alessio's *Secreti*, secrets are instances of practical knowledge, gathered and disseminated (in either manuscript or printed books) in the prescriptive recipe form. As such, their manipulation and transmission within – and between – the private and public sphere has been thoroughly investigated from different angles. Several scholars have highlighted the role of domestic households, pharmacies, and small trades (alongside courts, academies, and universities) in making and circulating secrets (recently, Leong 2018; Minuzzi 2016; De Vivo 2013; Leong and Rankin 2011). The growing interest in female agency has unveiled the role of early modern women in the practice of alchemy and medicine (Ray 2015; Rankin 2013). Another line of research addresses the reception and translation of Italian books of secrets across Europe (Martins 2015). Recent researches have reconstructed the life and socio-cultural context of successful “professors”, like Fioravanti (Eamon 2010), Della Porta (Verardi 2018) and the Jew Abramo Colorni (Jutte 2015: 116–223); while ongoing debates concern the real authorship of the *Secreti* of Alessio Piemontese and Isabella Cortese (1561), possibly pseudonyms of Girolamo Ruscelli (Celaschi and Gregori 2015: 206–221; and Rizzardini 2010).

Finally, a closer analysis of the recipes contained in these books and the creation of online databases are now allowing a more concrete understanding of early modern artisanal knowledge (some recent projects: Storey 2008; Leong et al. 2012; Neven et al. 2014; Smith and The Making and Knowing Project 2016).

Borri, Girolamo

Born: 1512, Arezzo/Italy

Died: August 26, 1592, Perugia/Italy

Michele Camerota

Department of Pedagogy, Psychology,

Philosophy, University of Cagliari, Cagliari, Italy

Abstract

Professor of Philosophy at the University of Pisa when Galileo was a student there, Borri was a fierce advocate of Aristotelianism. He considered Aristotle as “the true guide for philosophers” and maintained that “the whole posterity learnt more, and in a easier, better and sooner way, from him alone than from all antecedents” (*De motu gravium et levium*, 1575, *Preface*).

Alternate Names

Borro, Girolamo; Borrius Hieronymus

Biography

After studying theology, philosophy, and medicine (perhaps 3at Padua), in 1537 Borri entered the entourage of Cardinal Giovanni Salviati, serving him for 16 years. During this period he lived in Venice, Padua, Rome, and Paris. After Salviati's death in 1553, Borri became lecturer at the University of Pisa, where he remained for 6 years. He returned to Pisa in 1575, teaching philosophy until 1586. In the last years of his life, Borri is supposed to have taught in Perugia, where he died in 1592 at the age of 80.

Borri had a very troubled life, mainly because of his conflicts with the Church. Charged with suspicion of heresy, he was imprisoned twice by the Roman Inquisition, the first time in 1551 and then in 1583.

Innovative and Original Aspects

Borri authored several works, the most relevant of which are two treatises on natural philosophy: a dialogue on tides (*Dialogo del flusso e reflusso del mare*, 1561, with further revised editions in 1577 and 1583) and a book on the motion of heavy and light bodies (*De motu gravium et levium*, 1575).

As for the *Dialogue* on tides, Borri explained the raising of seas as due to the moonlight's heat, which produced a rarefaction of humid bodies and the resulting swelling of the waters. It must be remarked that, in defending such a theory (already held by several authors in the Middle Ages), Borri openly rejected the role of astrological influences, strongly denying their existence.

Borri's book on motion of the heavy and light bodies was rooted in a quarrel on the matter aroused among Pisan professors of Philosophy. We can confidently argue that his main rival in the quarrel was his colleague Francesco Buonamici. While the latter mainly relied on Greek Aristotle's commentators, Borri held a strict Averroist position, maintaining that the elements (whose dynamical tendencies determined, according to Aristotelian physics, the motion of terrestrial bodies) were not true substances, but intermediate entities between substance and

accident. On this ground, Borri also claimed that each element had a peculiar motion, being directly and entirely moved by its form.

Borri's works are important for a deeper appreciation of the Renaissance Aristotelian natural philosophy. It is noteworthy that he seems to share with other natural philosophers of the Tuscan scene (such as, for instance, Andrea Cesalpino and Francesco Buonamici) a remarkable refusal to resort to occult and theological causes in the explanation of natural phenomena.

This genuinely naturalistic approach might have exerted some influence on Galileo Galilei. Let us remind that the abovementioned books on tides and on motion were both owned by Galileo. Thus, Borri's theory of tides is discussed in the Fourth Day of the *Dialogue concerning the Two Chief World Systems*, whereas the *De motu gravium et levium* is explicitly cited in Galileo's youthful writings on motion (*De motu*) and proved to be an influential source for a few remarkable aspects of his early dynamics.

Abstract

Girolamo Borro (1512–1592) spent much of his professional life as a professor of philosophy at Pisa, where he wrote significant works on Aristotelian natural philosophy and logic. Borro was critical of Renaissance humanism and his approach to Aristotle demanded removal of what he considered Platonic and mathematical elements. In many cases, he agreed with Averroes. Inquisitors twice investigated him for heresy, linking him to Protestant movements and heretical doctrine, but he was never convicted.

Biography

Girolamo Borro (or Borri), a native of Arezzo, served as professor of philosophy at Pisa from

1553 to 1559 and again from 1575 to 1586. His tenure there was marked by disputes and controversies with his colleagues Francesco de' Vieri, Andrea Camuzzi, and Francesco Buonamici as well by his connections to some of the most famed intellectuals of the early modern period (Schmitt 1981). It is likely that Galileo Galilei was among his pupils and that Michel de Montaigne met him and described him as a consummate Aristotelian (Schmitt 1972; Heilbron 2010, 45–48). Some scholars have painted a largely negative picture of him as an example of the slavishness and close-mindedness of Renaissance Aristotelianism (Moody 1951, 415–18), yet his works show innovative and even experimental approaches to natural philosophy.

He published three significant works during his life, a vernacular treatise on the tides (1577), a lengthy Latin discussion of the gravity and levity of the elements (1576), and a Latin treatise on Aristotelian views of method (1584). Additionally, he wrote a short polemical treatise, *On the Causes of Our Ignorance*, which circulated only in manuscript. The *Causes of Our Ignorance* sets forth many of Borro's larger philosophical and intellectual commitments. He criticized the Greek commentators on Aristotle and Avicenna because they mix Aristotle with Plato, who was less concerned with nature than with applications of mathematical methods, which Borro dismissed as inappropriate for natural philosophy. To the contrary, Borro preferred Averroes, whose literal approach to Aristotle he deemed a pure and accurate defense of Aristotle, despite the carping of humanists and philologists (Martin 2014, 75–76; Schmitt 1981).

Borro's earliest work was *De flusso e refluxo del mare e dell'inondatione del Nilo*, first printed pseudonymously in 1561 and with the author's name attached in 1577 and 1583. It is a dialogue, a genre typical of Renaissance meteorology (Martin 2011, 66). In addition to showing the manner in which Aristotelianism entered into court settings, the work is notable for its defense of the eternity of earth against Thomas Aquinas's view (Dal Prete 2014, 309–10). Additionally, his argument that a temperate heat of the moon caused the tides by attracting water, acting in an analogical way to fire

that causes the movement of boiling water, was novel and among those that Galileo apparently rejected (Shea 1970).

In the *De motu gravium et levium*, Borro defended Averroes' understanding of the heaviness and lightness of the elements, by which the distinct natural motion of each element is defined by their form. For Averroes, the elements possess a status in between substances and accidents, meaning that the elements move on their own accord and that elements, except fire, have weight in their natural place. As a result, according to Borro, air has weight while in the air but not in water, and therefore has the tendency to move downward when in mixed bodies above the surface of the earth. Consequently, he held that wood should fall more quickly than lead because it is a mixture of three elements that have a natural downward motion, while lead is composed only of two – water and earth. Borro and a group of friends tested this hypothesis by repeatedly dropping roughly equal weights of lead and wood. The tests confirmed, according to Borro and other contemporary observers, the accuracy of Averroes' position because the wood supposedly fell faster than the lead, meaning its air's weight contributed to its descent (Camerota and Helbing 2000). These experimental tests, conducted and reported in Pisa in the years before Galileo's studies there, represent one, of several, precedents for Galileo's experimental understanding of fall bodies.

In his 1584 *De peripatetica docendi atque addiscendi methodo*, Borro discussed the nature of method. Borro contended that method was a path to learning doctrine and skill, rather than the Averroistic "way of doctrine." Thus according to the Averroistic path demonstrations and definition. Rather for Borro, method relied on analysis, synthesis, and diarsis. Analysis was the means for discovering, synthesis for writing, and diarsis for defining. He contended that the true method must be a quick, certain, uniform, and easily understood and must not be weighed down by the supposedly endless discussions found in philosophical commentaries (Gilbert 1960, 186–92).

Borro was investigated for heresy in 1570 and later in 1582–1583, accused of clandestine

Lutheranism, possessing forbidden books, and maintaining the mortality of the soul. From the last charge, he defended himself by aligning his views with Tommaso de Vio Caetano, a Dominican, who defended Pietro Pomponazzi with having the philosophical freedom to use philosophy to investigate concepts apart from the demands of Catholic doctrine. He was extricated from both processes through the intervention of powerful men. In the first case Grand Duke Francesco de' Medici intervened; in the second case Pope Gregory XIII helped obtain his release from incarceration (Baldini and Spruit 2009, 1,1:815–17).

Borro's work represents a continuation of the Italian tradition of natural philosophy that prized Averroes' exegetical approach to Aristotle. He stands out as an Aristotelian for his witty discourses, writing in both Latin and the vernacular, and for eschewing the commentary format. At the same time, his work has served as a starting point for showing the Aristotelian predecessors to Galileo.

Abstract

Giovanni Botero was an Italian preacher, poet, diplomat, and political thinker of the late Renaissance. Among his most influential works are the *Cause della grandezza e magnificenza delle città* (*Causes of the Greatness and Magnificence of Cities*, 1588), the *Ragion di Stato* (*Reason of State*, 1589), and the *Relationi universali* (*Universal Relations*, 1591–1596). The leading question of how States are founded, preserved, and steered to greatness is explored in his main works by engaging in a complex and not entirely unambiguous confrontation with the thought of Niccolò Machiavelli and Jean Bodin. A former Jesuit and a close collaborator of the Congregation of the Index, Botero purported to write in open reaction against the allegedly irreligious ideas of Machiavelli and his followers; at the same time, he incorporated several of Machiavelli's insights into his own political construction, thus achieving a precarious balance between religious ideals and political realism which reflects to some extent inherent tensions within Counter-Reformation political thought. Botero's main works have also been regarded as important stepping stones towards the development of modern disciplines such as political economy, demography, urban planning, statistics, human geography, and geopolitics.

Alternate Names

Botero, Jean; Boterus, Johannes

Biography

Botero was born in Bene Vagienna, in the Duchy of Savoy (Northern Italy), in 1544. At the age of 15, he entered the Jesuit College in Palermo, Sicily, which he left in 1560 to continue his studies in the Jesuit Collegio Romano. After several years spent teaching in various Jesuit schools in Italy and France, in 1580 Botero was expelled from the Society following an incident in Milan, without having pronounced his final vows nor realizing his dreams of being sent on a mission overseas (Chabod 1969; Firpo 1971). The disgraced Jesuit found unexpected succor in Charles Borromeo, the archbishop of Milan, who initially offered him a position as a parish priest in Luino (a small village on Lake Maggiore) and later hired him as his personal secretary. In the 2 years that he spent in the archbishop's service, Botero published his first important works, *De regia sapientia* (*On Royal Wisdom*, 1583) and *Del dispregio del mondo* (*On Contempt for the World*, 1584), both of which provide ample evidence of his awakening interest in political affairs (see Botero 1584, 1.17–1.19; Vasoli 1992). In 1585, following the death of Borromeo, Botero went on a secret mission to France on behalf of Charles Emmanuel I, duke of Savoy. His nine-month stint in Paris, where he worked with the duke's ambassador René de Lucinge to establish ties with the Catholic league in the midst of the civil wars, was crucial for his intellectual development and gave a new sense of urgency to his ever-growing political interests (Chabod 1969; Baldini 1992b). Shortly after returning to Italy, Botero entered the service of the young Federico Borromeo, Charles' nephew, and followed him to Rome, where the latter was elected cardinal in 1586. The 9 years that Botero spent in Rome were among the happiest and most productive of his life. Possibly as early as 1587, he began to work as a *consultore* for the Congregation of the Index, among whose members was his erstwhile

classmate at the Roman College, Cardinal Roberto Bellarmino. In 1588, Botero published *Delle cause della grandezza e magnificenza delle città* (henceforth *Cause*), the first of three masterpieces that brought him long-awaited fame and recognition. The *Cause* were followed only one year later by *Della ragion di Stato*, arguably inspired by contemporary discussions of Bodin's *République* within the Congregation of the Index (Descendre 2009). In 1591, Botero published the first volume of the *Relationi universali*, a geographical description of different countries of the world that purported to lay the groundwork for a study of the advancement of the Christian religion worldwide, but also provided a conceptual frame for justifying Spanish aspirations to a global empire (Headley 2000). Part two, on political geography, was released in 1592, whereas part three, on world religions, was completed in 1594 and published the following spring. When Cardinal Borromeo was appointed archbishop of Milan, Botero sought to remain in Rome, possibly with patronage from Philip II of Spain, but his efforts must have been unsuccessful: indeed, by the spring of 1596 he had already returned to Milan, where he put the final touches on the fourth part of his *Relationi universali*. The first complete edition of the work, in four parts, appeared in Bergamo shortly afterwards and was almost immediately reprinted in Venice. In 1598, Botero published a series of *Aggiunte* (*Additions*) to the *Ragion di Stato*, which he had been revising incessantly for the previous 9 years: the definitive edition of the work appeared that same year in Venice, for Giolito. In 1599, shortly after consigning to the press his two books *Dell'uffitio del cardinale* (*The Office of Cardinal*; Botero 1599; see Marchetti 1992 and Zucchini 1992), Botero quit Borromeo's service and moved to Turin, where he took up a well-paid position as a preceptor to the sons of Duke Charles Emmanuel I (Barcia 1992; Stumpo 1992). He remained in Turin until 1610, overseeing the education of the three young princes of Savoy and also joining them on a long journey to Spain, to the court of their uncle, King Philip III (1604–1606). Months after returning to Turin, Botero published his eyewitness account of Spain as an appendix to *I capitani* (*The Captains*),

a collection of biographies of great military leaders, and one of Botero's last works (Botero 1607; see Bielański 1992). He died in Turin in 1617, bequeathing his patrimony to the Society of Jesus and leaving the fifth part of his *Relationi universali* still in manuscript (now in Giorda 1894).

Heritage and Rupture with the Tradition

The unifying theme behind Botero's major works is the investigation of how to "found, preserve and extend the State" (Botero 1589, 1.1). Far from being unproblematic, such a definition of the essential aims of political rule raises issues of which Botero himself was acutely aware. Chief among such issues is that of the rightful boundaries of political action. Surely, Botero was careful to distinguish between a "good" and a "bad" type of "reason of State": while the former operates in conformity with Christian values and with the blessing of the Church, the latter pursues political *grandezza* (greatness) for its own sake, regardless of, and often against, the sanction of Catholic authorities. It is this latter type – allegedly propounded by Tacitus, Machiavelli, and the French *politiques* – that Botero sets about critiquing in his own *Ragion di Stato* (Firpo 1948; Descendre 2009). However, his discussions of specific cases often complicate this seemingly straightforward distinction: for instance, his call for secrecy and dissimulation (Botero 1589, 2.7 and 2.15), his praise of ruthless cunning in foreign relations (Botero 1589, 9.22), his heartfelt admiration for the greatness achieved by non-Christian empires (see, for instance, his praise of China in Botero 1588, 2, and 1596, 2.2), and his utilitarian view of religion as a stabilizing force ensuring unity and peace (Botero 1589, 2.16; see Chabod 1969) seem to suggest that the former Jesuit had learnt more from his polemical targets than he was willing to concede in principle. However, the question of Botero's "Machiavellianism" still remains to a large extent an open question. According to some scholars (for instance, Waley 1956; De Mattei 1979; Suppa 1992), a profound gap in mentality and intentions separates Botero and

Machiavelli beyond any superficial similarities; others, however, have underlined the continuities between the two authors, with particular respect to their conception of power relations within and outside the State (for instance, Tenenti 1992; Vasoli 1992; Descendre 2003, 2009).

Botero's relationship with the thought of Jean Bodin has been similarly debated. In particular, it has been suggested (Descendre 2003 and 2009, elaborating on earlier insights by Chabod 1969 and Tenenti 1992) that the absence of the language of sovereignty from the *Ragion di Stato* ought to be taken as an indication of Botero's attempt to elaborate a nonjuridical theory of the State: according to this interpretation, the Piedmontese deliberately built his idea of political power on Machiavelli's concept of *dominio* (domination or power *de facto*) as opposed to Bodin's concept of sovereignty (legitimate rule, i.e., power *de jure*). On the other hand, it should be noted that the discourse of sovereignty is not completely missing from Botero's outlook (see, for instance, Botero 1589, 2.11 and 4.6). Additionally, Botero seems to follow Bodin's *République* directly on many points, concerning (among other things) taxation, military strategy, demography, colonial policy, and climate theory. According to Waley (1956), this makes the French thinker "the most important single influence" on Botero's thought.

Another major problem encountered by Botero in his discussion of how to "found, preserve and extend the State" lay in the inherently controversial nature of the third of these objectives. Following a tradition dating back to Roman historiographers, Renaissance political theorists often viewed territorial expansion as a double-edged sword that led first to ephemeral greatness and then inevitably to decadence and collapse (see the classic discussion in Machiavelli, *Discorsi*, 1.6). Admitting that preservation and extension can be incompatible aims in the long term, Botero expressed a clear preference for the former over the latter (see, for instance, Botero 1589, 1.5–1.6, and 1596, 2.2, "Moscovia"). He argued that unchecked expansionism was not only potentially catastrophic for the State but also hardly acceptable on moral grounds, given the dubious legitimacy of military aggression (Botero 1589, 2.9).

At the same time, he believed that offensive war, though unjustified against fellow Christians, was perfectly legitimate and indeed praiseworthy against declared enemies of the Christian religion such as the Turks (*ibidem*).

As a safer alternative to territorial expansionism, Botero recommended intensive development within the country's fixed borders, by means of demographic growth, land improvement, and an ever more effective harnessing of local resources. He specifically pointed to the Low Countries (Botero 1588, 1, and 1596, 2.2, "Cina") and the Chinese empire (Botero 1588, 2; 1596, 1.2 and 2.2, "Cina") as virtuous models in this respect. Drawing attention to the "added value" produced by human labor (*industria*) as a crucial means of enhancing a country's wealth, Botero further advised that manufacturing and exports be encouraged by all possible means (De Bernardi 1931; Descendre 2003). However, despite his firm conviction that a larger population, an enlightened use of the territory, and an increased volume of exports would greatly stimulate national development, Botero did not believe in unlimited growth. In memorable pages that have been viewed by some (for instance, Roncaglia 2005) as an anticipation of Malthus' *Essay on Population*, Botero states that the greatness (*grandezza*) of a State is essentially tantamount to the size of its population, which in turn depends on two things: the "generative power" of human beings, which is relatively constant, and the "nutritive power" of a country, namely the maximum amount of people that a given territory is able to sustain. Now, since the "nutritive power" of a country can only grow up to a certain point, once this limit has been reached, stagnation or decline are the only two possible scenarios (Botero 1588, 3).

Botero's attention for the geographic and environmental conditions of political *grandezza* constitutes another major thread in his work (Magnaghi 1906, 1936; Chabod 1969; Descendre 2009; Miglietti 2016). While Bodin's sophisticated theory of climates was possibly the single most important source for the analysis of environmental influence in *Ragion di Stato* (Botero 1589, 2.7), Botero's interest in physical and human geography was also nourished by a vast corpus

of travel accounts, diplomatic reports (*relazioni*), and Jesuit missionary letters that provided him with ample information for his own *Relazioni universali* (Chabod 1969; Magnaghi 1936; Albonico 1990; Frigo 1992). Additionally, Botero was an eager reader of classical literature and particularly of Roman historians such as Tacitus (Schellhase 1992; Stegmann 1992). Although his use of sources has occasionally been condemned as uncritical (Chabod 1969 – but see Magnaghi 1936), what remains remarkable is Botero's capacity to craft such vastly diverse materials into an efficacious synthesis, thereby producing what has been rightly regarded as the first serious attempt at a geopolitical theory of the global world (Descendre 2009; Perrotta 2012; Prosperi 2013).

Impact and Legacy

The strength of Botero's thought lay in his ability to describe the complexity of the modern State in complete yet accessible terms. By aptly capturing the mutual implications of politics, war, economy, geography, culture, and religion in an age of State-building and colonial expansion, Botero imposed himself as one of the most respected political writers of his own time and made a significant contribution to the development of modern disciplines such as political economy, demography, urban planning, statistics, human geography, and geopolitics. Botero's main works were highly popular in his own day and remained influential until the end of the seventeenth century, with frequent reprints and translations into several European languages. Having crucially reformulated the terms in which the political debate was to be framed in the following decades (De Mattei 1979; Borrelli 2012), Botero's *Ragion di Stato* elicited a number of responses, critiques, imitations, and vulgarizations all over Europe, both in the form of commentaries (see for instance Apollinare Calderini's *Discorsi sopra la Ragion di Stato del Signor Giovanni Botero* [1597] and Castronovo 1973) and in that of original treatises (Curcio 1934; Thuau 1966; Firpo 1975; Betti 1992; specifically on polemical responses see De Mattei 1979). The *Cause*, too, circulated widely:

in addition to being customarily printed as an appendix to the previous work, it also occasionally appeared in self-standing editions or alongside treatises that discussed similar topics, as in the 1665 Helmstedt edition that proposed the work jointly with Hyppolit von Colli's *Incrementa urbium*. The *Relationi universali* enjoyed an even greater and more lasting success (Albonico 1992), imposing itself as a bestseller for decades to come and reaching the most disparate and remote audiences (see Tazbir 1992 on the Polish translation of 1609). The formerly vexed question of the Roman prohibition, in 1624, of the *Relationi universali* in all editions but the Tarino edition of 1601 was definitively solved by Baldini in an article based on Firpo's findings (Baldini 1992c). In England, Botero's thought influenced authors such as Francis Bacon, Walter Raleigh, Robert Johnson, and Robert Burton (Weber 2003; De Oliveira 2003; Fitzmaurice 2007; Miglietti 2016), while more generally contributing to the emergence of mercantilism and of a modern "commercial ideology of colonization" (Fitzmaurice 2007; Perrotta 2012). Botero's influence has been detected in French works such as Antoine de Montchrétien's pioneering *Traicté de l'oconomie politique* (*Treatise on political economy*, 1615: see Lavalley 1903; Panichi 1989) and Pierre Grégoire's *De Republica* (*On the State*, 1596: see Quagliani 1992); however, a full overview of Botero's fortune in France, similar to the one provided by Michael Stolleis for Germany (Stolleis 1992), still remains to be written. The reception of Botero in the Iberian Peninsula has been similarly understudied, with only a few notable exceptions (Maravall 1975; Fernández-Santamaría 1992; Puyol 2004; Casas Nadal 2007).

Biography

Little is known of Bouju's life. He was born into a Protestant family in the Anger region of France, the son of Jacques Bouju, President of the Parliament of Brittany. He later converted to Catholicism and was ordained into the priesthood. The title pages of his works indicate that in 1604 he was chaplain to French King Henry IV, while in 1603 he describes himself as simply "Catholic." By 1613, he had become "Adviser and Ordinary Chaplain to the King." Little else, beyond what his books tell us, is known about his life.

Works

Bouju is renown for two reasons. The first is related to the theological controversy which brought him into conflict with the Protestant Pierre du Moulin, from 1603 on. One of his earliest publications is perfectly explicit on this point: "*Methode de convaincre par la sainte escriture, tous schismatiques et heretiques. Selon laquelle est demonstrée la fausseté de la doctrine des pretenduz reformez Calvinistes, Zwingliens et Lutheriens, contraire à celle des Catholiques [...] contre le sieur du Moulin, ministre de la pretendue Eglise reformée, continuant à renier sa confession de Foy*" [*On the Method of convincing all schismatics and heretics through the holy scriptures. According to which the falseness of the professed reformist doctrine of the Calvinists,*

Humanités, Pessac, France

Abstract

Théophraste Bouju was a Catholic controversialist, an outspoken opponent of Pierre du

Zwinglians and Lutherans is thereby demonstrated, unlike the true Catholic doctrine [...] and in opposition to Monsieur du Moulin, minister of the professed reformed Church and who continues to recant his confession of Faith]. This work is dedicated to the “King of England, Scotland, and Ireland” whom Bouju rather sheepishly admonishes thus: “A raison dequoy, vostre Majesté venant à s’apercevoir, que l’instruction qu’on luy a donnée, ne conduit pas à son but, et à ses desseings, elle sera obligée de choisir une meilleure voye”[By reason of which, if His Majesty should come to recognize that the instruction he has received does not guide him to his own end and designs, then His Majesty should choose a better path].

Moreover, over and above these theological controversies, Bouju is the author of *Corps de toute la Philosophie* (1614), a voluminous appraisal (1,500 pages in folio) of Aristotelian philosophy: *Corps de toute la Philosophie divisé en deux parties. La premiere contient tout ce qui appartient à la sapience [...], la seconde contient tout ce qui appartient à la Prudence [...], le tout par demonstration et auctorité d’Aristote, avec esclarcissement de sa doctrine par luy-mesme* [The corpus of all philosophy divided into two parts. The first contains all which belongs to knowledge [...], the second contains all which belongs to Prudence [...], and both are demonstrated by the authority of Aristotle, with explanations of his doctrine by himself]. The work is dedicated to the King and Queen regent. In the preface, Bouju points to his desire to make philosophy accessible to all, with a view to promoting unity and peace across the French kingdom. His main target was the largely ill-educated old nobility whom he wished to convert to reason as a means of curbing their entrenched bellicosity: “En somme la philosophie est necessaire à un Estat, pour le conserver sans troubles” [Philosophy is necessary for the State, to protect it from unrest].

The *Corps de toute la Philosophie* provides a highly didactic synthesis (Bouju uses educational innovations present in the work of Dupleix) of a generally rather conservative vein of

Scholastic philosophy, indicative of Thomism and Jesuit influences. Like Dupleix, Bouju’s work by far surpasses mere compilation – he takes a stand on a number of points, both in the physics and metaphysics (see Ariew).

Boyle, Robert

Born: 25th January 1627, Lismore Castle, County Waterford, Ireland

Died: 31st December 1691, London, England

Jan-Erik Jones

Philosophy, Southern Virginia University, Buena Vista, VA, USA

Abstract

Best known for his work in experimental natural philosophy, Boyle published on such diverse subjects as theology, morality, chemistry, and natural philosophy.

He is revered for his empirical and rational approach to science and is credited with

defining the important scientific term “element” as well as perfecting the vacuum pump and discovering the relationship between temperature and pressure now known as Boyle’s Law. He was also an important critic of the Scholastic philosophy whose work and arguments influenced generations of philosophers and scientists.

The historical emphasis on Boyle’s rigorous work in natural philosophy often ignores his religious commitments, moral philosophy, missionary efforts, philanthropic projects, and his work in alchemy.

Biography

Robert Boyle, chemist, physicist, and arguably the most important experimental natural philosopher of the seventeenth century, was born into one of the wealthiest families in Britain. He was the seventh son and fourteenth (out of fifteen) child of Richard Boyle, 1st Earl of Cork.

Educated at Eaton (1635–1638), his favorite subject was history and found the rest of the curriculum uninspiring. After Eaton, his education was completed (1639–1644) by a “grand tour” of Europe under the tutelage of Isaac Marcombe.

From 1647 until the middle 1650s, Boyle maintained regular contact with experimental philosophers and social reformers in the group known as the Hartlib Circle. Samuel Hartlib, who shared Boyle’s conviction that science and philosophy should benefit humanity, was one of the figures who paved the way for the formation of the Royal Society. His association with the Hartlib Circle (which included – among others – William Petty and George Starkey) largely contributed to Boyle’s interest in experimental chemistry and alchemy.

Boyle believed that the recipes for medicines should be publicly available so the knowledge of how to alleviate suffering would be free to all. He also worked with his nephew, Robert Fitzgerald, on a desalination project to purify seawater onboard ships.

From 1662 to 1689, he was governor of the New England Company, which he saw as an opportunity to help spread Christianity among the Native Americans. Boyle engaged in other missionary efforts that included the publication of an Irish Gaelic Bible and an effort to introduce legislation in the parliament to encourage slave owners to treat their slaves who have converted to Christianity more humanely.

Boyle's works include reconciliations of religion with science and showing that the study of nature was a religious duty. He believed that the proper and systematic study of God's creations helps to develop the virtues of discipline, self-reflection, intellectual modesty, and logical thinking.

From c.1655 to 1668, Boyle took up residence at Oxford University and became associated with (*inter alia*) John Wilkins, Christopher Wren, John Locke, and Robert Hooke. It was in this period that most of Boyle's memorable and influential works were published.

Heritage and Rupture with Tradition

Boyle's generally Baconian approach to understanding nature consists in the reliance upon observation, natural histories, and experimentation and resists the formation of general theories. This empirical methodology was coupled with a metaphysical commitment to the mechanical natural philosophy, which claims that all natural phenomena can be explained by appeal to matter and motion alone.

Though Boyle allows for immaterial human souls in his account of the universe, he rejects the existence of any other immaterial causes within the natural order. His version of mechanism is called "corpuscularianism" because he holds that all physical objects are composed of material corpuscles, i.e., insensibly small particles arranged in various structures, but unlike atoms, corpuscles are physically divisible.

Boyle moved to Oxford in c.1655, and while in Oxford, he became a powerful advocate of the corpuscularian natural philosophy and a staunch critic of Scholastic philosophy, which appeals to

substantial forms and real qualities. He argued instead for the corpuscularian account of the origin of genera and species and of the qualities of bodies.

In Oxford, he joined the "invisible college," a forerunner of the Royal Society, and he collaborated with Robert Hooke to construct an air pump. Hooke's and Boyle's experiments on the properties of air led to discoveries on respiration, combustion, sound transmission, and – most famously – the relationship between the temperature and pressure of a gas known as "Boyle's Law." Boyle also used the air pump to create a vacuum as empirical evidence against the claim that vacua in nature are impossible.

Part of Boyle's research at Oxford was in conjunction with the American alchemist George Starkey and seems to be in pursuit of the philosopher's stone, which alchemists believed would help transmute other metals into gold.

In 1668, Boyle moved to London, set up a laboratory, and continued his scientific and philosophical pursuits. Living in London allowed him to participate in the Royal Society, and in 1680, he received an offer to become president of the Royal Society, though he declined the offer. He died in London, on New Year's Eve, in 1691.

Impact and Legacy

He was one of the founding members of the Royal Society of London for Improving Natural Knowledge.

Boyle authored a prophetic "wish list" which identified advances he hoped the Royal Society would make. The list includes organ transplantation, increasing life spans, submarines, airplanes, exact navigation aids, perpetual light sources, techniques for increasing yields from seeds, the transmutation of species in animals, vegetables and minerals, and an array of drugs that could cure pain, increase strength, enhance creativity, and improve memory.

He established an endowment for a series of lectures to defend Christianity that persists today.

He discovered Boyle's Law, which states that the temperature of a gas covaries with the pressure on the gas.

His definition of "element" as a structure of smaller particles that cannot be broken up is still accepted today.

He was an important influence on John Locke and Gottfried Leibniz.

Abstract

Poggio, like many other humanists of his generation, was not a systematic philosopher, and his works contain many apparent contradictions. This is all the more so since he wrote few expository tracts, but rather dialogues, a history, numerous letters, and a collection of jokes. He was a humanist who sometimes ranked the Church Fathers above the classics, denied the exemplary value of the ancient world, yet balked at the suggestion that the moderns could surpass antiquity or that modernity be judged by other standards than the classical past. An almost lifelong papal employee, he agitated against hypocritical clergy, yet fathered 14 children with his common-law wife. If there was one unifying factor in Poggio's outlook, it lay in his unflinching observation of human foibles and frailty, met with good-humored laughter, biting sarcasm, and sometimes deep despair.

Biography

Gian Francesco di Poggio Bracciolini was born in 1380 as Poggio di Guccio, in Terranuova in the upper Arno valley; in life he became known as Poggius Florentinus, after his death as Poggio Bracciolini. His father was a pharmacist; his mother, the daughter of a notary. At the end of the fourteenth century, Poggio's studies led him to

Florence, where he qualified as notary in 1402. Of modest means, he supported himself by working as a scribe and, on the basis of Carolingian models, designed the humanist script (*lettera antica*), from which modern Roman fonts descend (Ullman 1960; De la Mare 1973). In this way he attracted the attention of Coluccio Salutati, Florentine chancellor and foremost scholar of his day and mentor of a group of avant-garde humanists including Leonardo Bruni, Niccolò de' Niccoli, and Carlo Marsuppini. With Salutati's patronage, Poggio was appointed apostolic scribe (1403) and later secretary (c.1410). Poggio was present at the Church Council of Constance (1414–1418), where he showed himself critical of clerical abuses and wrote an apology for the burnt Hussite Jerome of Prague (1416). He also wrote a well-known letter on the public bathing habits of the Germans, whom he praised as Epicureans for their joyful approach to life and favorably contrasted with his compatriots (Harth 1984–1987; Gordon 1974/1991). It is unclear how Poggio sustained himself after the deposition of his master pope John XXIII in 1415 left him unemployed, and the search for ancient manuscripts he undertook from Constance may well have had a financial motive. With two curial colleagues, he explored the cathedral and cloister libraries of France, Germany, and Switzerland – most famously St. Gall – and recovered Quintilian's complete *Institutes of Oratory*, Lucretius' *On the Nature of Things*, and many other texts. Notwithstanding the fame generated by these finds, the new pope Martin V did not reemploy him at the secretarial level, and Poggio consequently took a position as secretary with Henry Beaufort, bishop of Winchester (1419). He did not like England's physical or cultural climate, nor did he locate the hoped-for classical texts in English libraries; instead, he read the Church Fathers with new appreciation. In 1423, Poggio returned to the Roman curia and followed pope Eugene IV in his Florentine exile in 1434. In 1436, at the age of 55, Poggio married Vaggia Buondelmonti, the 18-year-old daughter of a noble Florentine family, who bore him six children. This was the occasion for the dialogue *Should an Old man Take a Wife?*, in which Poggio argued for the benefits and pleasures of female company

(Bracciolini 1963–1969). The arrangement put an end to his common-law marriage to Lucia Pannelli, with whom he had 14 children, 3 of whom were legitimated in 1430; he took care, however, to provide for some of this offspring in his will. Over time Poggio acquired substantial property, including a country villa near his hometown (1438), which he furnished with ancient sculpture. Most of his literary output was composed over the next two decades, including imperfect Latin translations of Xenophon's *Cyropaedia* (1443–1447) and selections of Diodorus Siculus (1449) and Lucian (1455). Yet despite his personal and professional success, the progress of time was not altogether kind to Poggio. His old Florentine friends died in quick succession, and the younger generation of curial humanists, epitomized by Lorenzo Valla, was not to his liking: he could not compete with their knowledge of Greek and found their technical philology incompatible with the ideals of humanism. Poggio had long been close to Cosimo de' Medici, the effective leader of Florence from the mid-1430s, and invited to become Florentine chancellor in 1453 he enthusiastically accepted, only to be disappointed by the realities of incessant political strife. He retired from the chancellorship in 1458 and died in October 1459. Poggio was given a state funeral and lies buried in Florence's St. Croce, alongside his friends and former chancellors Bruni and Marsuppini (Walser 1914; Martines 1963; DBI 1971; ER 1999).

Works and Themes

Aside from occasional prose such as letters and orations, Poggio did not circulate literary works until he was almost 50. His earlier contribution to the humanist Republic of Letters can be gauged from the output of others. The last important exchange of Coluccio Salutati was with Poggio (1406) and concerned the literary and moral value of the ancient authors versus the moderns. Poggio took a "classicist" position, in that he assumed the automatic literary and perhaps philosophical superiority of the ancients against Salutati's contention that, with Christ, the foundation of ethics and therefore the purpose of literature had

permanently changed for the better. This debate forms the subject of Leonardo Bruni's *Dialogues for Pier Paolo Vergerio* (c. 1406), which showed him in fundamental agreement with Poggio (Fubini 1992). An echo of this *querelle* is heard in Poggio's exchange of invectives with Lorenzo Valla at the very end of his career (1452–1453). Valla's endeavor in the *Elegances* (1441) to replace literary connoisseurship with the systematic study of Latin grammar, lexicon, and syntax earned him Poggio's ire for the assumption that a "modern" could surpass the ancients in their own field. He was especially outraged that Valla applied philological methods to the study of sacred texts. In like vein, Poggio attacked Valla's Epicurean *On Pleasure* (1431) and *On the True and False Good* (1434–1441) for the threat their relativism posed to established Christian-Stoic morality. Erasmus later opined that, while Poggio could boast a fluent Latin style, Valla surpassed him in his knowledge of the language (Camporeale 1982; Trinkaus 1987).

Poggio's first independent work *On Avarice* (1428–1429) is of interest for its theme and for the light it sheds on his methods as an author (Germano 1994, Kohl and Witt 1978). Although the text is presented as an academic dialogue, there is neither a Ciceronian reconciliation of different views nor a skeptic suspension of judgment; furthermore, the choice and assertions of the three main speakers are ironic, so that it is unclear where Poggio stands. The question under consideration is the evaluation of avarice, which can refer to the sin of usury, but also glosses the impulse toward commercial activity for the sake of the accumulation of wealth. Pertinent issues are distinctions between public and private wealth, the Church and secular society, the moral or theological status of the vice or sin, and their effects. Since the dialogue takes issue with recent sermons of the Observant Franciscan San Bernardino of Siena endorsing commerce, it also raises the question of the value of the clergy as model and arbiter of the mores of secular society. Some scholars have seen Poggio as a spokesperson for a new, guilt-free approach to economic activity (Garin 1965), while others by contrast read his opposition to San Bernardino as a plea

to reinstate the rigor of the patristic Church (Oppel 1977, but cf. Goldbrunner 1979). In truth Poggio probably approves of what he views as part of human character – the wish to better one's position – as long as the ethical and economic costs and gains are considered carefully. He thus condemns the Church's arrogation of the right to forbid or condone, as well as the doubtful example set by the mendicant monks (Fubini 2003). Clerical hypocrisy is also a theme in Poggio's antimonastic dialogue *Against Hypocrites* (1447–1448) (Canfora 2008). Poggio notes, however, that hypocrisy is a uniquely human characteristic and – just like greed – not without societal benefits: the question is, again, under what conditions hypocrisy is acceptable. *On Avarice* is indebted to Bruni's translation of pseudo-Aristotle's *Economics* (1420), and *Against Hypocrites* to Bruni's 1418 treatise of the same name. Themes and examples from both Poggian dialogues recur in the *Prince* (1513) and *Discourses* (1513–1519) of Machiavelli.

Poggio's next texts address the triangulation of virtue, honor or glory, and nobility in the context of political life. In 1435 Poggio wrote a short letter denouncing Julius Caesar's crimes against the Roman Republic while presenting Scipio Africanus as the prototype of a leading citizen. An outraged vindication of Caesar by the Ferrarese humanist Guarino Veronese drove Poggio to compose a lengthier second treatise, which in turn inspired responses from Ciriaco d'Ancona (1436) and Pietro del Monte (1440). Poggio's text bespeak the political thought of the Roman Stoa – Cicero and Seneca are frequently cited – and advance virtue, rather than greatness of achievements, as criterion for evaluating leading men. Scipio deserves praise for putting his country's interests above his own, which demonstrates his Stoic self-control. By contrast, Caesar's supposed virtues Poggio redefines as vices – his liberality for instance was actually theft: cf. Machiavelli's *Prince* 16 for a similar re-description – since they served his tyrannical desires rather than the common good. Poggio also blames Caesar for the demise of Latin letters, since literary culture is incompatible with single rule. Taking up Bruni's anti-Caesarism in the

abovementioned *Dialogues* and his *Laudation on the City of Florence* (1404), Poggio's contributions to the *Caesar-Scipio Controversy* have become key exhibits of Florentine republican "civic humanism" (Baron 1966; Canfora 2001). His juxtaposition of Caesar and Scipio Africanus also inspired Giovanni Pontanus' meditations on both men (Schadee 2015). Poggio's following work, the dialogue *On Nobility* (1440), likewise advocates the paramount importance of virtue, this time as criterion for nobility. Yet in contrast to the political arena studied in the *Controversy*, the main speaker of *On Nobility* asserts that virtue is most plausibly approached through a contemplative life. The nature of this virtue is not systematically analyzed, but it again corresponds to the ethics of the Roman Stoa. The Aristotelian counterargument that virtue can be exercised only in a political life, which itself depends on external factors such as status and wealth, is certainly not Poggio's own position. However, to the other objection, that the Stoic ideal of virtue is unattainable, Poggio must have been sympathetic, as his following dialogues attest. Subsequent humanists writing on nobility, including Lauro Quirini, Platina, and Cristoforo Landino, all depend on Poggio's dialogue (Rabil 1991; Canfora 2002).

On the Unhappiness of Princes (1440), its counterpart *On the Vagary of Fortune* (1447–1448), and the rambling *On the Misery of the Human Condition* (1455) all discuss – with increasing anguish – man's vulnerability in the face of fortune. Although Poggio does not define fortune, his treatment suggests that he conceives of it not as a cosmic necessity, but rather as the uncertainties and complexities of human existence, which man cannot control and to which god, apparently, is indifferent (Fubini 1982). While his concept of virtue in these dialogues remains Stoic in the sense of being internal, autarkic, and founded on self-control, Poggio denies the Stoa's central tenet that such virtue equals happiness. In *On the Unhappiness of Princes*, he shows that power almost inevitably corrupts – regardless of the political system in which it is held (Canfora 1998, 1999). Yet, no less importantly, even if a prince were to succeed in cultivating virtue, the afflictions of fortune that

come with his position would still result in his unhappiness. *On the Vagary of Fortune* extends the latter argument to all men, public and private, as well as peoples and states (Merisalo 1993). In the process it offers reflections on the ruins of Rome and the calamities of contemporary politics: the classical past was no less wretched than the present, according to Poggio, and the greatness of Rome's former glory merely indicates the inevitability of decline. *The Misery of the Human Condition* elaborates these themes in combination with a fierce attack on the papacy, which also revisits Poggio's previous targets avarice, hypocrisy, and ambition (Kraye 1997). The text stands in stark contrast to humanist literature on the dignity of man produced at the time by Bartolomeo Facio, Giannozzo Manetti, and later Pico della Mirandola. As specimens of political thought, Poggio's works fit into a tradition stretching from Xenophon's *Hieron*, Cicero, Sallust, Seneca, and John of Salisbury's *Polycraticus* to Gian Battista Alberti's *Momus* (c.1450), Agostino Nifo's *On the King and the Tyrant* (1526), and again Machiavelli's *Prince* (Canfora 1998). As reflections on fortune, they echo Boccaccio's *On the Fate of Famous Men* (1355–1374) as well as Christian *contemptus mundi* literature (Fubini 1982; Merisalo 1993).

Arguably, Poggio's non-philosophical works, namely, his letters, the *Facetiae* or *Jokes* (1438–1452) and the *History of Florence* (unfinished), offer the clearest evidence of his mentality (Pittaluga 1995). In the *History*, which continues Bruni's (1415–1444), Poggio dispenses with some of his predecessor's partisanship and surpasses him in acute observation of the conduct and motives of his protagonists (Wilcox 1969; Struever 1970; Krantz 1987). The letters and especially the ribald *Facetiae* similarly demonstrate his sharp eye for human interactions, their rights and wrongs from different perspectives, and their comic potential. About a quarter of the *Facetiae* have a moral message; the remainder rather replace exemplarity with exhortations to see the world as it is, adapt to its conditions, brace oneself against fortune, and in the meanwhile try to live a joyful life (Tateo 1982; Sozzi 1982). This attitude may offer a connective thread through Poggio's manifold and seemingly contradictory concerns. Poggio

was strongly critical of the Church and set little store by Christian mores but defended the authority of scripture. Not immune to the value of pleasure and alert to cultural differences, he nonetheless rejected Epicurean relativism as a threat to any firm morality. He advocated republican values, but favored a contemplative life over politics as a more plausible path to virtue. This virtue he conceived of in Stoic terms, yet he denied it guaranteed happiness in life as it is actually lived. Thus, the primacy of virtue and its Christian-Stoic foundations were never in question for Poggio. However, he was always aware of the ways in which human experience falls short of the ideal. This realism, anti-dogmatism, and striving for authenticity, combined with a belief in absolute, if unattainable, moral standards, reverberates in all the works discussed, and is the particular voice of Poggio.

Bramhall, John

Born: Pontefract, 1594

Died: Dublin, 1663

Jack Cunningham

Department of Humanities, Bishop Grosseteste University, Lincoln, UK

Abstract

Archbishop John Bramhall's first significant appointment was in 1633 when he was made Bishop of Derry. Bramhall was a Laudian and in his new role he was mandated to bring the Irish Church in a more Catholic direction. His efforts to do so were interrupted by the Civil Wars.

As a Royalist, he fled to the continent when Parliament gained the upper hand. Here, his famous arguments with Thomas Hobbes took place firstly at a Royalist gathering and then Later in print. Against Hobbes' determinism, Bramhall's thesis rested on the principle that man is capable of choice. In addition, his positive assessment of the human condition led him to assume that we are capable of choosing good and therefore, in part at least, able to work out our own salvations.

Biography

John Bramhall was born in Pontefract, south Yorkshire, the eldest of six children. He attended King Edward VI Grammar School until the age of thirteen when he went up to Sidney Sussex College, Cambridge. He graduated MA in 1616, the same year as he was ordained a priest in the Anglican Church. His first parish was at Micklegate, York, in 1617, and the following year he married Helen Collingwood who provided with a good library.

In the archdiocese of York Bramhall's industry soon brought him to the attention of Thomas Wentworth who had been made Lord Deputy of Ireland. It was his remit to fix what was regarded as the broken Church of Ireland, and clearly he saw in Bramhall a potentially able assistant. Very shortly after he arrived in Ireland in 1633, Bramhall was made Bishop of Derry, in apparent disregard of the fact that at 39 he was a year too young for the episcopate. Working closely with Bishop William Laud, who was at this stage leader of the Church in England in all but name, their mission was twofold. Firstly, they would reform the rather Calvinist protestant ethos of the Irish Church then under the primacy of Archbishop James Ussher. Secondly, they would restore to it its lost fortunes. In both they managed some success until the English Civil War made martyrs of both Wentworth and Laud; Bramhall escaped with his life but only by fleeing to Brussels.

On the continent, he formed part of a Royalist circle in exile which included Charles II. He moved around a great deal including a risky visit to Catholic Spain. He also penned seven books which were largely controversies with either Catholics or Protestants from a more reformed stable. His most famous exchange came about after an incident in 1645 at the Parisian residence of the Marquis of Newcastle where Bramhall engaged in a debate on free will with Thomas Hobbes. Afterward, their arguments were continued in print with three books from Bramhall and two from Hobbes.

At the Restoration in 1660, Bramhall arrived back in England with the royal household. He was

rapidly made Archbishop of Armagh and Primate of Ireland. He continued, as much as he was able, his previous effort to drag the Anglican Church in Ireland in a more Catholic direction, but he managed only 3 years in the role. In 1663 he died after a number of strokes.

Bramhall's reputation as a thinker rests largely on his exchange with Thomas Hobbes about "liberty and necessity," a discussion that has been characterized as the most famous of the seventeenth century (Chappell 1999). Bramhall's three volumes, *A Defence of True Liberty from Antecedent and Extrinsic Necessity* (1655), *The Castigation of Mr. Hobbes' Last Animadversions* (1658), and *The Catching of the Leviathan* (1658), set out to defend man's ability to choose between right and wrong. Hobbes' counterargument maintained that humans were compelled by a series of imperatives. As the arguments progressed, they became more heated and have been described as going "beyond sober philosophizing (Thomas 1971)." Bramhall brings to his philosophy an optimistic assessment of the human condition. His theological circle has now become known as Laudianism after the abovementioned William Laud. The prevailing Calvinistic theology in the English Church regarded man as so marred by the fall of Adam that he was incapable of his own salvation. Heedless of this, Laudians like Bramhall believed that mankind retained something of a spark of goodness, a spark that eventually drew them to God. When he translated this into philosophical terms, it made him a proponent of "Libertarianism," which argues that man has the freedom and ability to make real moral choices (Cunningham 2007). There is much riding on this for Bramhall since according to him Hobbes' determinism brings down the entire Christian edifice. If we cannot choose, we cannot help what we do and in the eyes of God and mankind we can subsequently be neither good nor evil.

Brandolini, Aurelio Lippo

Born: 1454

Died: 1497

Annalisa Ceron

Department of Philosophy, University of Milan, Milan, Italy

Abstract

Aurelio Lippo Brandolini was an Italian poet and teacher of rhetoric who briefly attended the court of King Matthias Corvinus of Hungary. While in Budapest, he wrote the most interesting of his humanistic prose works, a political treatise, written in the form of a dialogue, in which he made analytical and original comparisons between kingdoms and republics to assert that the former constituted the better form of government. Because of its anti-republican arguments, this dialogue has been considered one of the most important works of Renaissance political thought.

Biography

Aurelio Lippo Brandolini was born into a middle-class family in Florence in around 1454. When, in

1466, they faced financial difficulties, his parents moved the family to Naples. That was the year in which an anti-Medicean coup took place in Florence.

Despite being almost blind (“Lippo” means to have blurred vision), Brandolini completed his education in *studia humanitatis*, became a poet of a certain renown, and obtained a position teaching rhetoric in a school in Capua. His skill as a poet earned him the favor of King Ferdinand I of Naples, who was a staunch supporter of humanistic culture and a patron of the arts.

In addition to his poems in Latin and the Italian vernacular, during his stay in Naples, Brandolini wrote a number of eulogies in tribute to such personages as Lorenzo de’ Medici and Federico da Montefeltro and two works in prose: an Italian translation of Pliny’s panegyric of Trajan, which he dedicated to the king in 1478, and the *De rei militaris litterarumque dignitate affinitate et laudibus*, an oration on the dignity of arms and letters, completed in 1479.

The following year, Brandolini moved to Rome, where he taught rhetoric at the university. There he composed a collection of poems dedicated to Pope Sixtus IV, a commentary on Virgil’s *Georgics* (after 1480), a work influenced by the new humanistic approach to classical texts, and an oration in defense of Antonio Lauredano (1486), a rare example of Renaissance judicial oratory. Since his efforts to obtain Lorenzo de’ Medici’s patronage and thus return to Florence proved fruitless, in 1489 he accepted the invitation of the Hungarian ambassador to Rome to take up a post-teaching rhetoric at the University of Budapest.

Hungary was then ruled by Matthias Corvinus, who had married the daughter of Brandolini’s former patron, Beatrice of Naples, in 1474. Matthias was the first non-Italian monarch to promote the spread of Renaissance culture in his realm: a learned man, educated in humanistic studies, he was an extremely generous patron, and many artists from the Italian city states and Western Europe frequented his court.

Although Matthias died mysteriously in April 1490, Brandolini had time to dedicate a moral dialogue on the human condition to him, the *De*

humanae vitae conditione et toleranda corporis aegritudine (1490). In the same year, he completed the aforementioned political dialogue on the best form of government, *De comparatione reipublicae et regni*. While the former work was printed in Basel in 1498, the latter survived in only two manuscript copies: one dedicated to Lorenzo de’ Medici (copied in around 1492) and the other dedicated to the future Pope Leo X (copied in the first decade of the sixteenth century).

After the death of Matthias, Brandolini returned to his natal city and taught Latin at the university for 1 year. He then came under the influence of the preacher Fra Mariano da Genazzano, an adherent of the Medici and critic of Savonarola; in 1491 he joined the Augustinian order and dedicated his life to preaching in various cities of Italy. He did not, however, entirely give up writing humanistic works, as evidenced by *De ratione scribendi libri tres*, an adaption of classical rhetoric used for Christian purposes, written in around 1495 and published in Basel 3 years later. Having contracted the plague while on a visit to Rome, Brandolini died in Florence in 1497.

Heritage and Break with Tradition

Although Brandolini was celebrated by his contemporaries for his skill as a poet and teacher of rhetoric, he was also a writer of humanistic works in prose, which, like his poems, were written in both Latin and the Italian vernacular. He played no part in the humanistic controversy about the literary merits of the Italian vernacular, but in the dedicatory letters of his translation of Pliny’s panegyric, and in the preface to his oration on arms and letters, he made clear his belief that Italian should be preferred to Latin in order to expand the readership of literary works.

The translation of Pliny’s panegyric was intended as a eulogy of the King of Naples, who was described in accordance with the humanistic depiction of the perfect prince. Like other Neapolitan humanists such as Antonio Beccadelli (*De dictis et factis Alphonsi regis*, 1455), Giovanni Pontano (*De principe*, c. 1465), and Diomedes Carafa (*De boni principis officio*, after 1480),

Brandolini claimed that a good prince should be endowed with all the virtues necessary to be a beloved ruler and faithful servant of his subjects.

The oration on the dignity of arms and letters dealt with another typical humanistic theme: Brandolini did not limit himself to extolling the importance of humanistic studies, but went as far as to say that moral wisdom and eloquence were required to become good citizens, create sound laws for the city, engage prudently in war, support soldiers, and make peace with enemies. Thus he showed that humanistic studies lay at the core of political life.

Brandolini's *Georgicorum carminis commentarii* is worthy of particular attention, since the author, in the wake of Pomponius Laetus's philological approach to classical texts, focused on the literal meaning of Virgil's *Georgics* rather than the allegorical one and peppered the commentary with erudite quotations drawn from Greek and Latin works in order to impart maximum information on the history and way of life of the ancients.

Also of interest is *De humanae vitae conditione et toleranda corporis aegritudine*, a treatise conceived as a dialogue between King Matthias Corvinus and the ambassador of Ferdinand I of Naples in Hungary. While the king deplored the physical suffering and spiritual anxiety of men, echoing the *De miseria humanae conditionis*, a highly successful treatise written by Lotario di Segni (the future Pope Innocentius III) in 1195, the ambassador gave voice to Brandolini's ideas in praise of the greatness of men as described in Giannozzo Manetti's *De dignitate hominis*. Manetti wrote his masterpiece between 1448 and 1450, at the insistence of the King of Naples, Alfonso V of Aragon. His aim was to complete Bartolomeo Facio's *De excellentia ac prestantia hominis* (1448–1449), which challenged Lotario di Segni's view that the human condition was one of unrelenting miseries. To pay tribute to the greatness of man, Manetti added many quotations drawn from classical sources, such as Cicero's *On the Nature of the Gods*, Aristotle's *On the Soul*, and Aristotle's ethical works, to all the traditional religious arguments on the dignity of the human being. Like

Manetti's work, Brandolini's dialogue used both religious arguments and classical sources to celebrate man's extraordinary ability to act in imitation of his creator and in accordance with his divine, immortal, and rational soul.

But the other dialogue written in Hungary, *De comparatione reipublicae et regni*, was without doubt the most original and influential of all Brandolini's writings. It compared monarchies and republics, Matthias Corvinus himself championing the former, while Domenico Giugni, a Florentine merchant in the Hungarian court, sought in vain to defend the latter.

Innovative and Original Aspects

Brandolini's political dialogue was so innovative in form and content that it has been recently considered by James Hankins "the most fascinating work of humanistic political theory written before Machiavelli" (Hankins 2009, p. ix). As noted by Brandolini himself in the preface, *De comparatione reipublicae et regni* was written in the Socratic style. Unlike a Ciceronian dialogue, the form most commonly used by humanists from Petrarch onward, it was a series of questions and answers aimed at cross-examining naïve opinions and debunking uncritical assumptions. Matthias Corvinus took the role of Socrates, and, in response to a question from his (illegitimate) son, John Corvinus, about the ideal form of government, demolished one by one all the republican arguments advanced by his Florentine interlocutor.

The Socratic dialogue between the King of Hungary and Domenico Giugni spanned 3 days, which were dedicated, respectively, to liberty, justice, and effective government. It provided a direct, analytical comparison between kingdoms and republics unequalled in Renaissance political thought. From Nicolai Rubinstein (1991, pp. 30–65) to Quentin Skinner (Skinner 2002, pp. 368–413), scholars have in fact highlighted how for humanists good governance depended on the moral virtues of good rulers rather than on the political particularities of constitutions. Apart from Niccolò Machiavelli, only a few of them,

such as Bartolomeo Platina and Francesco Patrizi of Siena, wrote about kingdoms as well as republics, but they did so in separate treatises in order to avoid making overt comparisons between the two forms of government (Platina's *De principe*, 1470, and *De optimo cive*, 1474; Patrizi's *De regno et regis institutione*, 1481–1484, and *De rei publicae institutione*, 1465–1471). Lauro Quirini's *De republica* (1450) was no exception, since it dealt only with the republican form of government. It is true, however, that Baldassarre Castiglione explicitly juxtaposed kingdoms and republics in the fourth book of his *The Book of the Courtier* (1513–1529), but this comparison followed the Ciceronian style of dialogue, leaving readers free to draw their own conclusions. By contrast, Brandolini's dialogue made it clear that Matthias's commendation of kingdoms was the correct point of view to be accepted and supported without reserve. It is therefore unsurprising that at the end of the dialogue, the merchant was forced to admit that he would leave the Republic of Florence, which he had used as an example in his analysis, to live in a kingdom as good as the one described by his interlocutor.

To convince Domenico Giugni that the kingdom was indeed the best form of government, the King of Hungary referred to Plato's *Laws* and *Statesman*, which had become available only a few years earlier when Marsilio Ficino's Latin translations were printed in Florence (1484), rather than to Aristotle's *Politics*, which was still the most popular reference for humanists. He also made hints about the sixth book of Polybius's *Histories* to thereby develop a criticism of the mercenary system, a negative comment rare among humanists before the circulation of Machiavelli's works. During the fifteenth century, Polybius's theory of the evolution of constitutional forms, according to which kingdoms degenerate into tyranny, tyranny into aristocracy, aristocracy into oligarchy, and so on, was almost unknown. Even so, Brandolini's dialogue built on this theory to contend that kingdoms were the most natural and therefore most common type of government. Yet his work did not present the ancient Republic of Rome as a form of mixed government able to avoid the spiral of political decline: instead, several historical

examples proved that all republics were inherently unstable, whereas kingdoms always guaranteed order and peace.

The idea that kingdoms represented the ideal form of government was demonstrated through a series of arguments that appear to be antithetical to those used by civic humanists such as Leonardo Bruni and Matteo Palmieri, even though they were not explicitly mentioned. For instance, the notion that the principal feature of a republic was autonomy or self-rule was challenged by the claims that citizens nevertheless had to obey the law in any event and that there was no difference between citizens imposing laws on one another and a king doing so. If anything, it was better if laws were emanated by kings chosen for their virtue, as proved by a kingdom as perfect as Hungary, rather than by citizens who become rulers by chance, as in the Republic of Florence where citizens attained public office by lot.

In the course of his analysis, Brandolini offered a highly idealized image of the royal constitution, which maintained that kings were virtuous by definition. And since kings were flawless, they were able to adapt laws to different people and circumstances in the interests of the common good. On the other hand, as the case of Florence unquestionably demonstrated, the rulers of republics were bound hard and fast to the letter of the law, which became the expression of the interests of the most influent and powerful citizens. In Brandolini's view, hunger for power was closely connected to lust for money, and the pursuit of wealth was the main and most dangerous problem that beset republics.

In the wake of John Pocock's studies (Pocock 1975), many scholars have remarked that Florentine civic humanist and, more generally, early modern republican thinkers believed that the search for private wealth should be subordinated to the defense of the common good. The Florentine interlocutor of Brandolini's dialogue shared this belief with Florentine civic humanists, but the king proved that it was false, arguing that only in kingdoms the search of private wealth did not conflict with the defense of the common good. What is more, he disclosed that the sumptuary laws that were intended to guarantee egalitarian practices in the Republic of Florence concealed

economic inequalities that were absent in any kingdom as the mass of wealth was concentrated in the hands of the king while the subjects enjoyed more or less the same level of prosperity. Once again, the Republic of Florence was depicted as the negative pole of the comparison, whereas kingdoms represented the positive pole due to the fact that they were highly idealized. Clearly the comparison between kingdoms and the Republic of Florence was partial and unfair, but if it had been conveyed in more balanced terms, it would not be as interesting as it is.

In contrast with another commonplace belief of civic humanists, who made Florence a case in point to show that the Renaissance in arts and letters depended on republican institutions, Brandolini's dialogue drew attention to the fact that the Naples of Ferdinand I and the Rome of Sixtus IV housed a greater number of artists and writers than republics like Lucca and Siena. The extraordinary excellence of Florence in the arts was not denied but viewed as a corollary of the Tuscan climate, the physical weakness of its inhabitants, and other such factors. In other words, the flourishing of culture in Florence was viewed as a product of nature, not of politics.

Since Brandolini maintained that kingdoms promoted culture, equity, and liberty better than republics, his dialogue stood out from the mass of more conventional works on the virtues of the perfect rulers. Moreover, the arguments he used to demonstrate that kingdoms constituted the best form of government shed a new and interesting light on the republican claims generally developed by civic humanists.

Impact and Legacy

As already noted, only Brandolini's dialogue on the dignity of men and his final work on the subject of rhetoric ever made it to print, and since they were reprinted many times during the sixteenth century, the *De humanae vitae conditione* (Basel, 1540, 1541, 1543; Wien 1541; Paris 1562) and the *De ratione scribendi* (Basel 1543, 1549, 1565, 1585; Cologne 1573) had a certain impact on Renaissance thought.

However, his most compelling and original work, the *De comparatione reipublicae et regni*, survived in only two manuscripts and remained undiscovered until the end of the nineteenth century when it came into print for the first time (Brandolini 1890). The editor of the most recent edition has considered it the most fascinating work written prior to Machiavelli. If that is true, there can be no doubt that the legacy of Brandolini is truly exceptional.

Briggs, Henry

Born: 1561 Warley Wood (Yorkshire)

Died: 1631 Oxford

Denis Roegel

University of Lorraine, Nancy, France

Abstract

Briggs is a English mathematician. He is the author of the first table of decimal logarithms, published in 1617, of the first extensive table of decimal logarithms of numbers (1624), and of the first extensive table of decimal logarithms of trigonometric functions (1633).

Biography

Briggs was educated in Cambridge and took the degree of Bachelor of Arts in 1581. In 1592, he was made examiner and lecturer in the faculty of mathematics, and soon after reader of the physics lecture.

In 1596, Briggs became the first professor of geometry at Gresham College, London. Gresham College was then England's scientific center for navigation, geometry, astronomy, and surveying and was founded under the will of Sir Thomas Gresham. Briggs kept an interest in navigation and around 1600, he worked with William Gilbert and Edward Wright and constructed a table relating the latitude and the magnetic declination (Wright 1610). Briggs' investigations were published by Blundeville (1602) and Ridley (1613). In the early 1610s, Briggs worked on the computation of eclipses. He also published a partial edition of Euclid's Elements (Briggs 1620). Later, in 1622, he published a small tract of the *Northwest Passage to the South Sea, Through the Continent of Virginia and by Fretum Hudson*.

But Briggs' main work took place from 1615 to his death, when he developed decimal logarithms, and in particular methods to compute them, together with extensive tables.

Briggs stayed at Gresham until 1620, at which time he went to Oxford, having been appointed the first Savilian Professor of Geometry in 1619.

Heritage and Rupture with the Traditions

In 1614, John Napier (1550–1617) had published his *Mirifici logarithmorum canonis descriptio*, the description of his table of logarithms. After Napier's publication, Briggs went to visit him in Scotland in the summers of 1615 and 1616 and they agreed on the need to reformulate the logarithms, a task that Briggs took over.

Briggs published his first table of decimal logarithms in 1617 (Briggs 1617). It was a small booklet of 16 pages giving the decimal logarithms of the integers 1 to 1000 to 14 places.

Innovative and Original Aspects

Seven years after his first table of logarithms, Briggs published his *Arithmetica logarithmica* which gave the logarithms of the numbers from 1 to 20,000 and from 90,001 to 100,000 with

14 decimals (Briggs 1624). In this book, Briggs gave a detailed account of his methods, which sometimes anticipated Newton's developments. It is thought that Briggs had completed a large portion of the interval 20,001–90,000 in the subsequent years. But it is likely that Adriaan Vlacq's own table published in 1628, and based on Briggs' work, caused Briggs to postpone his project.

So, Briggs worked on tables of logarithms of trigonometric functions, first introduced by Gunter in 1620. Briggs' tables, his *Trigonometria britannica*, were completed by Gellibrand and published in 1633 (Briggs and Gellibrand 1633). That same year, Vlacq published again his own tables of logarithms of trigonometric functions. Although Briggs and Vlacq both used a division of 90 degrees, Briggs divided the degrees centesimally, whereas Vlacq used the usual sexagesimal division.

The *Trigonometria britannica* contains the sines to 15 places, the tangents and secants to 10 places, the logarithms of the sines to 14 places, and the logarithms of the tangents to 11 places, every hundredth of a degree.

Impact and Legacy

Briggs' tables, adapted by Vlacq, formed the basis of most tables of logarithms published until the mid-twentieth century, tables which were essential in engineering practice until the advent of electronic calculators and computers. But the decimal logarithm, as well as the natural logarithm, survive these tables and have remained fundamental functions in mathematical analysis.

Browne, Sir Thomas

Born: October/November 19, 1605, London, England

Died: October 19, 1682, Norwich, England

Claire Preston

School of English and Drama, Queen Mary University of London, London, UK

Abstract

Thomas Browne, physician, philosophical prose writer, and natural philosopher of profound and unique literary power, was highly

influential in seventeenth-century England and in the European Republic of Letters. His works blend scientific and theological insights to meditate on the nature of religious belief, the empirical pursuit of truth and the banishment of error, the frailty of human enterprise, and the marvellous richness of the natural world. His writings, persistently influential in the Western tradition, have inspired writers as diverse as Coleridge, Melville, Thoreau, Woolf, and Borges.

Biography

Thomas Browne (born London, October/November 19, 1605 – died Norwich, October 19, 1682) could never be described straightforwardly as a “philosopher,” and yet his influential meditative and investigative writings in an enormous range of early-modern categories – natural philosophy and natural history, theology, introspective life writing, medicine, and the problem of error – helped to establish the forensic relation to phenomena that characterizes the mid- and late-seventeenth century, especially among practising scientists.

Born into a comfortably secure merchant family in London, he was educated at Winchester and then at Oxford, where he was exposed to the rising scientific culture that prompted his interest in medicine. After completing his M.A. there in 1629, he sought his medical training on the Continent, at Montpellier, Padua, and finally Leiden, where he was awarded his degree in 1633. In these very distinct medical regimes, he encountered learned medical botany and natural history, holistic clinical approaches and advanced anatomical training, as well as intensely practical, professional guidance.

Returned to England, he eventually settled in Norwich in 1637, where he remained for the next half century as a practising doctor, learned savant, and internationally acclaimed writer. His major works, *Religio Medici* (1643), *Pseudodoxia Epidemica* (1646–1672), and *Urne-Buriall* and *The Garden of Cyrus* (1658), all draw on personal experience, of religious belief and controversy, of erroneous belief and empirical corrections, of mortuary customs, and of local botany. He corresponded with some of the most celebrated

figures of the learned republic, who were admirers of his work. In Norwich, however, although the city was second only to London in wealth and population, he was remote from the convivial intellectual communities of the metropolis: he was made an honorary fellow of the Royal College of Physicians only in 1664 and had no formal association with the Royal Society. That removal is fortunate for students of Browne, who thereby have a surviving, mainly learned, correspondence that might have been far less voluminous had he lived in close proximity to his peers.

Heritage and Rupture with the Tradition

Browne exemplifies a broadly bipartisan address to investigation during the period when the long reign of Aristotle and the remnants of Scholastic philosophy were yielding to Baconian principles of the reestablishment of fundamental knowledge by empirical means. If the textual authorities of the High Middle Ages (which were still featured in the university curriculum) were in competition with the empirical practices of the anatomy theatre, the physic garden, the telescope, and with the developing culture of clinical observation, Browne’s writings portray both an intellectual engagement with the new learning and a justifiable reluctance to jettison everything that had come before it. Thus, he observes an unimpeachably Galenic medical regime while practising a patient-specific bedside manner that is far more typical of early-modern departures from Galenism; he is astronomically and mathematically learned and is yet skeptical of heliocentrism; he is a powerful apologist for Anglican toleration while advocating civility to the Pope and keeping clear of English Republicanism; he investigates a strange disease of children in the south of France like an open-minded clinician and testifies in a local witch trial with similar latitude. Nothing in Browne’s writing strictly breaks with his inherited traditions nor does he slavishly follow them. What is striking is his consistent refusal to be governed by any but his own conclusions, which naturally varied between the old and the new. He is both an ancient and a modern, “Janus in the field of knowledge.”

Innovative and Original Aspects

His most important philosophical work is undoubtedly *Pseudodoxia Epidemica*, also known as *Vulgar Errors*. This exceptionally successful work, an encyclopedia of errors that he systematically corrects – in the natural world, in history, and in superstition – is perhaps the clearest application of Francis Bacon's proposed instauration of learning, a work structured as a series of searching questions about commonly believed "fact." In clearing the debris of ignorance and misapprehension from the landscape of knowledge, Browne demonstrates not only what is to be done in each case but how to do it. This is by no means original, for Bacon had many enthusiastic followers at mid-century, but it is comprehensive beyond anything else produced in the period. Its most important section, moreover, is his extended disquisition on error and misbelief: part theological, part anthropological, and part psychological; Book 1 of *Pseudodoxia* is a powerful interrogation of our propensity to error and most significantly our adherence to received authority. It is not too much to claim that this discussion best summarizes the empirical tenor of early modernity.

Impact and Legacy

Leading writers and natural philosophers of his own day acknowledged Browne's ideas and influence – Robert Boyle and John Evelyn were two of his English admirers. His work, its style as well as its subjects, has animated succeeding generations, and those who cite him with great approval include Pepys, Johnson, Coleridge, Melville, Thoreau, Poe, Dickinson, Woolf, and Borges. But he has suffered, at least until recently in the academy, as a "quaint" rather than a substantive writer, notable for his *bien pensées*, attractive especially to the belletristic tradition of the nineteenth and early twentieth centuries. In a famously rebarbative (and misapprehending) essay, Stanley Fish attempted to demolish Browne in comparison with more meaningful work of Donne, Herbert, and Milton. But Browne has colluded in his own

demolition: too various and polymathic to fit easily into one or another thematic or generic category, his writing is in some respects fissile, digressive, and contingent, his style at once gorgeous and opaque. His prose is metaphysical and forensic, conceitful and empirical, and these qualities now interest scholarship and even lay readers as they have not done since Browne's own lifetime.

Bruccioli

► Brucioli, Antonio

Brucioli, Antonio

Born: 1498

Died: 1566

Eva Del Soldato

Romance Languages/Italian Studies, University of Pennsylvania, Philadelphia, PA, USA

Abstract

Printer and writer, Antonio Brucioli never received a formal philosophical training but developed nonetheless one of the most remarkable editorial program of vernacular philosophy: he translated Cicero, Pliny, and most importantly Aristotle, and composed a series of dialogues, which recovered motifs from many ancient and modern philosophers. His philosophical achievements – in any case – have been usually shadowed by his reputation as a heretic and a political opponent of the Medici family. Raised in the context of the Orti Oricellari meetings in Florence, Brucioli spent the better part of his life in Venice.

Alternate Names

[Bruccioli; il Bruciolo](#)

Biography

Brucioli was born in Florence in 1498 into a well-established family. He befriended Luigi Alemanni and was introduced as a young man to the meetings of the Orti Oricellari, where he developed literary and philosophical interests. Despite some sources made of him a pupil of Francesco Cattani da Diacceto, it is not possible to connect the two men in a precise relationship (Dionisotti 1980). In 1522, some members from the circle of the Orti were involved in a conspiracy against cardinal Giuliano de' Medici: Brucioli was among them and he left Florence, traveling around Europe and establishing contacts particularly in France.

He went back to Florence in 1529, during the second republic, but he was forced to leave the city for good when he was accused of being a follower of Luther. He went therefore to Venice, where he opened a printing press together with his brothers and soon devoted his efforts to a well-known vernacular version of the Bible, first published in 1532 (Spini 1940a). This was not, in any case, Brucioli's first printed offspring: in 1526 he had already published the first volume of a series of philosophical dialogues, the *Dialogi*. Brucioli worked intensely, also in collaboration with other printers, producing editions of Petrarch and Boccaccio, but also a vast array of religious texts, which included commentaries on the Scriptures and booklets (Spini 1940b). A significant – and dramatic – turning point of his life happened in 1548, when he had to close his printing shop and leave temporarily Venice, because of a trial for heresy. When he went back to the lagunar city, he desperately looked for patrons and was forced to work even more intensely than in the past. In 1558, he faced his third and final trial for heresy (the second happened in 1555): old and poor, he was granted home arrest and he died in 1566 (Grendler 1977, Del Col 1980, Barbieri 2007).

Brucioli was not a professional philosopher, but certainly a man of great erudition. This is clear from his *Dialogi*, which were devoted to every branch of philosophy (ethics, politics, and economy in the first volume; natural doctrines in the second and in the third; metaphysics in the fourth; a selection of witty dialogues discarded from the other four volumes in the fifth) and presented a vast array of sources. In certain passages – and particularly in the first book – Brucioli even plagiarized other authors (e.g., Erasmus, see Seidel Menchi 1979; Leushuis 2013), while showing a preference for utopian topics (Lastraioli 2012): the perfect captain, the perfect city, etc. Despite the scarce originality of the doctrines expressed in the books, where both Platonic and Aristotelian traditions play an important role, the *Dialogi* were one of the first philosophical work to appear in the vernacular, a primacy that Brucioli constantly emphasized in the prefaces to each book. The *Dialogi*, furthermore, offer a fresh outlook on the conversations that animated the

Orti Oricellari (Machiavelli appears as a character and his ideas are alluded to from time to time in the dialogues) and some of Venice's cultural organizations (Procacci 1995, Bausi 2015). Between 1526 and 1544 Brucioli constantly revised the dialogues, changing and adding passages, and modifying the names of the interlocutors. The other philosophical achievements of Brucioli were mainly translations. Those of Cicero (the *Dream of Scipio* and the spurious *Ad Herennium*) and Pliny are significant, but his most important efforts were his vernacularizations of the Aristotelian corpus (Boillet 2008). Brucioli translated the *Politics* (1547), the *Physics* (1551), *On the Heavens* (1552), *On Generation and Corruption* (1552), the *Meteorology* (1555), and *On the Soul* (1557) (Allen and Del Soldato 2014), which were all printed by Bartolomeo Imperatore, the only exception being the *Politics*, which was issued by the Brucioli brothers before the forced closing of their printing press. Brucioli was therefore the first author to translate a vast selection of the scientific works of Aristotle in the vernacular, a choice that, as he himself declared in the preface to the *Physics*, was largely dictated by circumstances, because Bernardo Segni had just finished translating the ethical and rhetorical works of the Stagirite at the time. Brucioli needed in fact to work on texts that – until then unattended to aside from the *Politics* and the *Meteorology* – could have earned him the appreciation of patrons and a place in the burgeoning market for vernacular books (Del Soldato 2016). His need to produce these translations as quickly as possible probably explains why – despite the fact that he declared that his versions were taken directly from the Greek – they are in reality based on Latin translations of the Aristotelian works (Del Soldato 2016). Brucioli's translations – which were probably intended for a university audience – did not meet with wide appreciation and circulation. The reputation of Brucioli as a heretic made him a controversial author, to the extent that his *opera omnia* was condemned in the Index of Prohibited Books. Aside from Brucioli's biographical misadventures, the absence of commentaries that accompanied the translations weakened their editorial impact as well. Nonetheless, despite the

commercial nature of these works, Brucioli achieved the most important corpus of philosophical vernacularizations of the entire sixteenth century.

Bruni, Leonardo

ca. 1370 (Arezzo)–1444 (Florence)

TN, USA

Abstract

Leonardo Bruni was among the bestselling authors of the fifteenth century and among the most influential early Renaissance humanists. This entry briefly explores Bruni's life and writings with emphasis on his contributions to the history of rhetoric and philosophy across the many genres of his published works.

Biography

Leonardo Bruni was born ca. 1370 in the Tuscan town of Arezzo. In his youth, he came to Florence

and joined the circle of people around Coluccio Salutati (1331–1406), the elderly Florentine chancellor who was actively promoting the new focus on the *studia humanitatis* – that is, the study of history, poetry, grammar, rhetoric, and ethics – among both learned people and the population at large. Bruni was among the first to publish Latin translations of Greek texts under the tutelage of Manuel Chrysoloras (1350–1415), a Byzantine who began teaching Greek in Florence in the late 1390s. Multiple translations of Greek texts into Latin and even Italian followed, in addition to original works heavily indebted to Greek models. Beyond his prolific translations, Bruni also published works of history, philosophical instruction, education, model letters and speeches, biographies, political treatises, and others. He was the official historian of the Florentine Republic from 1415 and served as the city's chancellor, that is, the city's head secretary and occasional spokesperson, from 1427 until his death in 1444. Bruni was arguably the most widely read author and translator of the fifteenth century (Hankins 1997).

Bruni lacked a coherent underlying set of philosophical principles that shaped his writings. Instead, Bruni wrote works across genres for different purposes and in different contexts. Despite their heterogeneity, his writings across genres served as a model that many later writers, orators, and thinkers sought to emulate. Moreover, Bruni came from comparatively humble origins in Arezzo, and yet he transformed his station into that of a prominent statesman and patrician within Renaissance Florence, a position that he passed down to his son. Bruni's rise in power and wealth through learning and politics served as a model that others sought to emulate throughout the fifteenth century. This essay examines some of the many areas in which Bruni's writings and life proved influential, particularly during the fifteenth and early sixteenth centuries: his activities as an orator and letter writer; his translations; his writings on language, politics, history, ethics, and metaphysics; and his model career as a humanist statesman.

Orator and Letter Writer

Most of Bruni's professional life was spent writing letters and delivering speeches, and, in both

areas, his works served as influential models throughout the fifteenth century. Bruni's career as a secretary began in 1405 when he joined the men charged with writing letters and documents for Pope Innocent VII (r. 1404–1406). Bruni continued to serve as a papal secretary for the next 6 years, serving under two more popes before leaving papal service around 1410. For a single year, Bruni took over the position of Chancellor of the Florentine Republic, a role that required him to write letters and documents conveying the decisions of the city's officeholders and their advisors. In 1411, he briefly returned to papal service before ending that role again and returning to Florence in 1415. It was not until 1427 that Bruni returned to an official secretarial role. In that year, Bruni resumed his former position as Chancellor of the Florentine Republic. It was a post he held until his death in 1444 (Griffiths et al. 1987). Over the course of these decades, Bruni created an immense body of letters and speeches in both the vernacular and in Latin, a quantity far too large to list individually here.

Over his career, Bruni wrote commissions and letters to Florentine diplomats, letters to foreign rulers, summaries of speeches delivered in advisory bodies, wrote speeches for others to deliver, speeches for himself, and collected letters sent to friends and colleagues. The content of the overwhelming majority of this work was indebted to the very specific political circumstances at hand. The instructions and basic contents for most of these documents were determined by the Florentine officeholders at the time. Nevertheless, one common theme to which Bruni often returned in these writings related to the significance and legitimacy of republican regimes in a European world dominated by princely rule. Bruni frequently framed the decisions provided to him by officeholders within the context of Florentine liberty, by which he generally meant the ability of Florence to set its own external agenda, free from external claims to power, as well as the freedom of elite Florentines to aspire to and occasionally hold political office (Viti 1992; Griffiths 1999).

Bruni broke with past Florentine chancellors in his more overt emulation of classical rhetorical models and his rejection of more recent styles.

Previous chancellors and orators had striven to emulate a formal rhetorical style, known as the *ars dictaminis*, which relied upon quite specific word patterns, superlative adjectives, and other particulars. Bruni, however, led the way to a new form of oratorical eloquence aimed at imitating classical rhetoricians such as Cicero. He was a master at emulating the classical Latin style that he and his contemporaries valued. In orations, Bruni emphasized the rearrangement of words toward aural effect. He also sought to base the vocabulary of his Latin speeches much more closely to the words and forms used by ancient writers. His speeches were frequently modeled explicitly on classical models (Witt 2000). For example, his speech delivered before the Florentine mercenary captain Niccolò da Tolentino (1350–1435) was based upon an ancient speech by Cicero, the *Pro lege manilia* (Maxson 2015). Bruni's speeches became highly sought after as models to emulate, and later speakers have left examples of speeches heavily indebted to words uttered by Bruni on similar occasions.

Translations and the Theory of Translating

Bruni's translations from Greek into Latin and from Latin into Italian introduced multiple new texts and authors to Latin Europe. The study of Greek, while not unknown, was little practiced in the centuries before Bruni. As such, many classical authors were completely unknown in western Europe, while others were known only through descriptions or short extracts included in late Antique and early medieval encyclopedic works. Bruni was among the first group of individuals who actively sought to reintroduce Greek works into western Europe through Latin and vernacular translations. For example, his first Greek to Latin translations were also some of his most popular, partly for their subject matter and partly for their short length: St. Basil's *Letter to the Youth*, which defended the value of a liberal arts education, and Xenophon's *Hiero*, which explored the benefits and drawbacks of being a ruler (Hankins 1997; Maxson 2010). Many other works followed. Bruni translated several *Lives* of Plutarch, including the lives of Aemilius Paulus, Cato, Demosthenes, Mark Antony, and others. In addition to

Xenophon's *Hiero*, he also translated Xenophon's *Apology*. He created Latin versions of several dialogues by Plato, such as the *Apology*, *Crito*, *Gorgias*, *Phaedo*, and *Phaedrus*, as well as a set of letters then thought to have been written by Plato. Bruni also translated the *Nichomachean Ethics* and the *Politics* by Aristotle, in addition to the *Oeconomics* (at the time considered genuine). Bruni reintroduced several speeches by Demosthenes, excerpts from Homer, parts of Aristophanes, and others. These translations brought works to readers in western Europe that had not been read there in centuries.

Many of these translations into Latin were then translated into Italian and even other languages, at times under Bruni's supervision. Bruni's conception and use of the vernacular as a literary and learned language will be discussed in more detail below, but for here, it is sufficient to state that Bruni not only reintroduced some of the now classic works of Greek philosophy into the Latin west, but vernacular translations of his works by others helped popularize the texts for the large and literate population of the Italian peninsula and beyond. Bruni's Latin translation of St. Basil's *Letter to the Youth*, for example, was translated into both Italian and Spanish. Bruni's biography of Cicero existed in Latin, Italian, and French versions. His *On the Gothic War* was translated into Italian, Spanish, and even English, while his *On the Punic War* had an extensive manuscript tradition in both Latin and Italian, with fewer copies of versions in French, Spanish, and Catalan. Both Bruni's *Introduction to Moral Philosophy* and his *Hiero* existed in German editions, among other languages (Hankins 1997). In short, Bruni's introduction of several Greek classics to Latin and vernacular readers secure him primacy of place in the history of Renaissance thought and philosophy.

Yet, in addition to his actual translation of Greek works, Bruni was also innovative in terms of his ideas about how best to translate a work from one language into another. Specifically, Bruni advocated for translators to capture the sense of a passage when translating, rather than focusing on the then more traditional practice of translating one word at a time. In his *On the*

Correct Way to Translate, Bruni urged translators to capture the ideas of a text but also to transfer, as much as possible, the eloquence of the original author into the new language (Bernard-Pradelle 2008; Hankins 2003; Botley 2004). These ideas about translation led Bruni into a heated controversy with a contemporary Aristotelian philosopher. For two centuries, scholastic philosophers had been relying upon a literal Latin translation of Aristotle's *Nichomachean Ethics*. Bruni produced a more rhetorical translation (1416) that altered both the sense and the vocabulary of the text in Latin. His translation was controversial and sparked an exchange that reveals how far Bruni's approach differed from previous translators. Bruni's critic (Alfonso da Cartagena (1384–1456)) claimed that Aristotle was not eloquent as Bruni had claimed; that Boethius was the translator of the older version, not a Dominican friar as Bruni had claimed; and that Bruni was wrong to have criticized this older translator. Bruni responded to each point in turn, stating that Aristotle was in fact eloquent, that Boethius was not the translator; and that he was merely criticizing the translation and not the integrity of the previous translator. The matter did not end there, however, and a second controversy erupted nearly 10 years after the book's original publication. In this second controversy, Bruni's accuser was far more wide-ranging. He questioned Bruni's attempts to make the text more rhetorical and thus stray from the familiar terms of the older translation. He argued that Aristotle, as an authority, spoke the truth and that those instances where he seemed incorrect were places where Aristotle had attempted an allegory or, perhaps, where the translation might be incorrect. He contended that Bruni was placing rhetorical eloquence above philosophical content, but that in philosophy true eloquence came, not from style, but from finding and understanding answers to questions. Bruni responded to these arguments by reiterating the claims he had made earlier about translation, namely, that his concern as a translator was to render into Latin that which the Greek had said (Griffiths et al. 1987).

Bruni's translations in practice at times deviated from his ideal of capturing the sense and

eloquence of an original text. For example, Bruni – and other fifteenth-century translators – tweaked or even removed passages that he found offensive or unnecessary. For example, Bruni removed or modified references to homosexual relations in works by Plato and Xenophon. Bruni also tended to paraphrase and choose Latin words for Greek concepts that reinforced the usual values and assumptions of Bruni's contemporaries, thus making the classical work in question intentionally more palatable to his audience (Hankins 1990). Moreover, Bruni's contemporaries argued that he did not distinguish adequately between translating and composing original works. The most prominent example of this was Bruni's *History of the Gothic Wars*, which was heavily indebted to Procopius' book on the same topic. Detractors of Bruni's treatment, particularly a rival Biondo Flavio (1392–1463) who was writing an account of the same events, argued that a history based upon a single source was insufficient for constructing an accurate historical narrative (Ianziti 2011).

Bruni's translations enjoyed enormous success in the decades after his death. Manuscript copies of early translations of short works like St. Basil's *Letter to the Youth* and Xenophon's *Hiero* exist in 200 or more copies. Copies of Bruni's translations of various lives by Plutarch and dialogues of Plato exist in dozens of copies each. Vernacular versions of Bruni's Latin translations were created, and an Italian version of Bruni's translation of Aristotle's *Nichomachean Ethics* survives in at least ten copies, while the Spanish version is preserved in at least five more manuscripts. Even more popular were vernacular versions of Bruni's historical works, which often exist in dozens of manuscript copies (Hankins 1997). Bruni's translations were progressively replaced by later translators, such as Marsilio Ficino and Erasmus, in the latter fifteenth and sixteenth centuries.

Conceptions of Language

Bruni's prolific career as a translator fit into a broader context of reflection upon the relationship and statuses of different languages. These concepts arose across several works that spanned Bruni's career. In Bruni's *Dialogues*, the

individuals presented discuss different opinions on the significance of vernacular writings by Dante, Petrarch, and Boccaccio versus the Latin production of the same figures. Bruni returned to these themes much later in his two biographies of Dante and Petrarch, respectively. He also contributed to a discussion among learned papal secretaries about the relationship between the vernacular and Latin.

In many ways, Bruni's views on the relationship and respective statuses of different languages were quite traditional. He argued that the study of Hebrew, for example, was a waste of time, given that what was significant from Hebrew writings already existed in Latin. Bruni's arguments contrasted with those advanced by some of his contemporaries. For example, Poggio Bracciolini (1380–1459) viewed the study of Hebrew as useful, if for nothing else the insight it offered into the translation methods of Saint Jerome. Giannozzo Manetti (1396–1459) worked to learn Hebrew and created a rough translation of the Vulgate Bible into Latin, even as his primary motivation was the conversion of Jews to Christianity (Botley 2004).

Bruni's views on the status and validity of Italian as a literary language seem to have changed over the course of his career (Hankins 2006). In the early fifteenth century, Bruni was close to Niccolò Niccoli (1364–1437), a man who viewed the vernacular with some disdain. He and others around him were known for their learned discussions in which they praised Antiquity, sought to recover the writings and forms of classical Latin as it had been read and written during the ancient period, and bemoaned the loss of the ancient world and its culture over the past millennium. Niccoli and like-minded individuals grouped the vernacular into that postclassical period of decline. Bruni's *Dialogues* preserves some of the types of arguments that this group was making. The vernacular, they argued, was the language of the mob and unfit for literary expression. As examples, they offered texts such as Dante's *Divine Comedy*, Petrarch's *Sonnets*, and Boccaccio's *Decameron*. They argued that these three famous Florentine authors should be judged solely upon the style of their Latin works, and all three men were found wanting (Griffiths et al.

1987; Bruni 1996; Bernard-Pradelle 2008). It was quite common to view Latin as a superior and more sophisticated literary language than the vernacular, but the embrace of this extreme form of classicism was controversial even among humanists (Quint 1985). Bruni seems to have been ambivalent in his early career: the way the arguments are presented in his *Dialogues* suggests they may not have had his full support, even as the work explicitly states that Bruni was sympathetic to them.

Bruni's audience for his original works and translations was expanded through the vernacular versions mentioned above. Bruni's use of the vernacular, however, coincided with views on the origins of Italian that differed from those of his contemporaries and of modern linguists. In 1435 Bruni engaged in an oral discussion about the relationship between Latin and the vernacular in the classical past. Bruni argued that classical Rome, like fifteenth-century Florence, had two distinct languages. He claimed that a speaker in classical Rome like Cicero was only understood by the well-educated, while most people only understood a few Latin words, much like many of Bruni's contemporaries experienced the mass. Bruni's arguments contrasted sharply with those of his contemporary Biondo Flavio, a long-serving papal secretary who penned several long humanist histories. Biondo argued that Latin was the only language of the classical world, even as there were clearly different styles of expression. Over time Latin had changed, and the vernaculars had differentiated themselves from both Latin and each other. Biondo's arguments are much closer to how modern students of language view their subject; however, both Bruni and Biondo's positions were taken seriously in the 1430s, and the debate has been positioned as one of the earliest theoretical and historical discussions on the relationship between Latin and Italian, a discussion that continued into the next century (Celenza 2015; Griffiths et al. 1987; Tavoni 1984). Bruni's arguments fit into stronger affirmations of the literary potential of the vernacular than he had offered earlier in his career, as evidenced by passages in his *Life of Dante* written around the same period (Baron 1955).

Political Writings

Perhaps Bruni's best-known works in recent decades are his largely pro-republican works written on behalf of the Florentine state. These works spanned over forty years of Bruni's life and have given rise to heated debates among historians over the dating of specific works, the depths of Bruni's sincerity in writing them, and their originality. The most significant works in this debate have been Bruni's *Dialogues*, his *Praise of the City of Florence*, his *Oration for Nanni Strozzi*, and his *History of the Florentine Republic*. Each of these works fits into a different context: The *Dialogues* and the *Praise* were literary works produced in the early 1400s; the *Oration* (ca. 1428) and *History* (1415–1444) were works written while Bruni served as head secretary of Florence. Yet, despite their temporal and contextual differences, all four works argue that Florence enjoyed a legitimate form of republican government. This legitimacy derived from the Roman Republic, under which Florence was founded by Roman veterans. As the descendant of Rome, Florence could argue that it did not owe allegiance to the Holy Roman Emperor, the French, the Byzantine Emperor, or the pope, because all these figures traced their authority back to the Roman Empire, which post-dated the republic. Thus, not only was the city independent, but all its wars and territorial claims were justified because Florence was heir to the same lands once possessed by its Roman republican progenitor (Fubini 2003).

Bruni's arguments for the independence and authority of the Florentine Republic built upon the thought of earlier writers. The fourteenth-century thinker Bartolo da Sassoferrato had expounded a definition of tyrannical rule based upon a legitimate source of power and benevolent treatment of the ruled. Bruni's mentor Coluccio Salutati had picked up this definition and used it in his treatise *On the Tyrant*, a work written around 1400 and thus at a time when Bruni was a member of his circle. Bruni applied this same definition across his original political works. For example, in both the *Dialogues* and the *Praise*, Bruni used the illegal usurpation and wicked rule of the Roman emperors as evidence to delegitimize their claims – and thus those individuals claiming

descent from them – over Florence. On only one occasion did Bruni question the legitimacy of non-republican forms of government and instead applied standard definitions of just versus unjust rule to evaluate the validity of competing claims to power (Maxson 2010).

Bruni also conceived of the Florentine republic along the traditional lines of an oligarchic regime ideally consisting of a well-educated, wealthy, and noble patriciate. He worked closely with the Florentine Guelph Party – a governmental body that sought to promote oligarchic government of the most established families in Florence – to rewrite their bylaws. He dedicated a treatise, *On Knighthood* (ca. 1420), to the city's most prominent members of the oligarchic regime (Bayley 1961). Additionally, Bruni sought to position himself, socially, among the Florentine oligarchs, although he was clever enough to avoid inextricable entanglements and thus managed to enjoy political prominence throughout the politically tumultuous 1420s, 1430s, and 1440s in Florence (Martines 1963; Viti 1990; Maxson 2014; Field 1998).

Yet, Bruni's arguments were innovative in several ways too. Although relying upon standard abstract foundations for his republican thought, Bruni's writings had far wider implications than previous thinkers. Bruni helped create a form of "civic humanism" that was a malleable concept that spread throughout the population of Florence. Civic humanism in this context was the propagation of the idea of the legitimacy of the Florentine republican form of government; that this government was rightly dominated by a small group of individuals; and that all other members of the Florentine ruling groups had the possibility of holding office on occasion, with the expectation that this potential for and occasional practice of officeholding would bring social honor, but not real political influence (Najemy 2006). The Florentine population seems to have bought into this conception of rule, and it helped reinforce the increasingly restricted nature of political power in Florence during the 1410s, 1420s, and 1430s. Thus, Bruni's arguments, while not necessarily original in an abstract sense, were innovative in the extent of their widespread application.

In addition, the ways that Bruni presented and sought to prove his points were also original. The *Praise of the City of Florence*, for example, was modeled on a Greek oration in praise of Athens. This emulation was original because it made such heavy use of a Greek text, as well as for Bruni's reintroduction of a solid, classical example of a Ciceronian style (Witt 2000; Griffiths et al. 1987). In another example, in the *Oration for Nanni Strozzi*, Bruni made a blanket condemnation of all princely rule, an extreme statement that he did not repeat, but one that demonstrates the lengths to which his argument about the legitimacy of Florence's republican government could be stretched (Hankins 2000b). Bruni shaped the narrative and structure of his *History of the Florentine People* to emphasize the city's independence and legitimate claims to rule others, points further developed in the next section.

Bruni's arguments about Florentine republicanism had a long-lasting impact on the history of political thought in Europe. The republican, patriotic, and civic duty ideas popularized by Leonardo Bruni were picked up by other writers, most notably Niccolò Machiavelli in the early sixteenth century. Readers of Machiavelli, in turn, also adopted these republican ideas, with influences felt throughout many political thinkers of the Enlightenment. The ideals of civic humanism have been traced in the writings of men like Thomas Jefferson, who helped draft the foundational documents for the United States (Pocock 1975). The concept of civic humanism, meanwhile, in slightly altered form, has even been controversially assigned to the underlying principles of American, British, French, and Italian governments during the late twentieth century (Hankins 2000a).

Historical Writings

Bruni wrote biographies and histories of classical, medieval, and even contemporary events. Bruni's first original historical writing was a biography of Cicero published in 1413. In 1415, Bruni was commissioned to write an official history of the Florentine Republic in Latin and based upon classical models. Although this project occupied him

for the rest of his life, Bruni also produced several other pieces of historical writing while he worked on that project. In 1422, Bruni published his *On the First Punic War* to fill in a key missing section from Livy's only partially extant history of Rome. Around 1430, Bruni returned to biography and penned a *Life of Aristotle*, in part to offer a counter-narrative to the portrait offered by the classical writer Diogenes Laertius, which a rival (Ambrogio Traversari [1386–1439]) was then translating from Greek into Latin. Another pair of biographies followed in 1436, this time of the Florentine poets Dante and Petrarch, where the contrasting *prudencia* of the two men in political affairs was brought to the forefront. Three more historical works appeared toward the end of Bruni's career: The *Commentary of Greek Affairs* (1439) relied heavily on a work of Xenophon to present a history of Greece in the fourth-century BCE; Bruni's *On His Own Times* (1441) chronicled a history of Bruni's lifetime from his own perspective; and finally, in 1441 Bruni published his *On the Gothic War*, which drew heavily upon Procopius' version of the same events (Ianziti 2011).

Across this multitude of works, Bruni made many innovative moves in the study of the past. For example, he was among the first historians to adopt the influential periodization scheme of European history into a classical past, a middle age in which the major achievements of the classical past were lost, and then a Renaissance period in which those classical innovations were being rediscovered. He was among the first historians to conduct archival research to help construct an historical narrative, an approach that is particularly revealing in the latter books of the *History of the Florentine People* (Bruni 2001–2007). Bruni expanded the scope of history to include places outside the ordinary: for example, his *Commentary* was the first work of Greek history published in Latin since Antiquity (Ianziti 2011). When constructing historical interpretations, Bruni at times ostentatiously compared and critically analyzed the sources available and tended to rely upon those evidentiary sources that were closest to the events discussed. The best-known example of this approach was in Bruni's account of the role of

Charlemagne in Florentine history, where Bruni concluded it was unlikely that Charlemagne had refounded Florence, but had instead just helped rebuild the city. Bruni's adoption of Livy as a model for an official history of Florence inspired imitators throughout the Italian peninsula. Courts and other republics scrambled to have their own version of the past created to compete with the version so eloquently written by Bruni. The sum of these many innovations has inspired some historians to label Bruni as the first modern historian (Ianziti 1997).

Alongside and often underlying these multitudinous innovations, Bruni retained many of the motivations and practices of his historical predecessors. For example, Bruni's critical use of sources was sporadic and usually was used as a tool to argue for or against a historical point that served to legitimize or delegitimize a historical action or claim. Bruni clearly viewed the period before his own as lacking in Latin eloquence, but Bruni did not question that political arguments in the present could be and were based upon unbroken lineages back to classical Antiquity. Bruni's incorporation of source material into his own works often constituted only superficial changes for stylistic purposes. Some of his historical works, such as his *On the Gothic War*, were criticized already in Bruni's own day as being so close to his original sources as to blur the lines between an original work and a translation. Bruni presented logical and historical arguments for interpretations that furthered his own goals and that of his patrons, but he also relied on quite traditional means to establish historical narratives as more "true" than a competing claim. For example, in both 1428 and 1439, Bruni presented drafts of his *History of the Florentine People* to the Florentine government amidst rituals rife with civic and religious significance. The inclusion of the books in these rituals sought to associate divine favor and blessing upon the narrative, and then the copies of the books presented were housed within the chapel in the principal Florentine governmental building. Research, logic, and beseeching divine favor all meshed together to argue for the accuracy of Bruni's narrative (Maxson 2012).

Ethical and Metaphysical Writings

Renaissance humanists like Leonardo Bruni embraced a different kind of learned ideal than had been prized in the medieval period. In Antiquity, two different types of learned ideals had emerged. On the one side, some individuals prized the pursuit of philosophy, which they understood as the pursuit of truth and understanding. On the other side, others prized the pursuit of oratory, which they understood to mean the ability to speak, argue well, and persuade others to a specific proposition. The philosophical side of this coin had dominated European learned discourse since the 1000s. Humanists, particularly from the mid-1300s, began offering a competing ideal that focused on the study of ethics and the tools necessary to persuade others to ethical action or the orator's point of view (Griffiths et al. 1987). Toward this end, the humanists argued that people should receive an education grounded in moral philosophy, the tools of persuasion (grammar and rhetoric), and a pool of emulative examples (poetry and history). Bruni presented this basic model for education in his *Treatise on the Study of Literature*, while his contemporaries made similar arguments in educational treatises of their own (Kallendorf 2002).

Bruni made one contribution to contemporary debates about ethics in his popular compendium of classical ethics, his *Introduction to Moral Philosophy*. The work draws heavily upon various works by Cicero and Aristotle, even as it diverges from both authors in various specifics. Bruni's work examines three basic questions: Is there an end to human affairs? What is that end? And how is that end acquired? After quickly affirming that a final end does in fact exist, the treatise examines the nature of that end by presenting differing answers based upon different schools of classical philosophy, particularly the Epicureans, the Stoics, and the Peripatetics. All of them are in basic agreement that happiness is the common end, and thus Bruni turns to discussing the pursuit of virtues and the avoidance of vices as the path toward this final end (Griffiths et al. 1987; Bernard-Pradelle 2008). Although the content of the work is largely derivative, during the fifteenth century it enjoyed wide circulation, existing in

dozens of manuscript copies as well as a German and a Spanish translation (Hankins 1997). In addition, the work is interesting as an historical piece in that it was among the first philosophical works of the Renaissance based upon classical sources in their original languages, rather than intermediaries. The book also features a consideration of Aristotle not as "The Philosopher," but as one thinker among many (Griffiths et al. 1987).

Other Contributions: Textual Studies and Political Career

Beyond the ideas and style of his writings, Bruni made important contributions in areas outside of his oratory, original writings, and translations. Bruni played a role in the rediscovery of Latin texts in the early fifteenth century and in the humanist-influenced changes in status measures during the 1400s. Bruni himself made few manuscript discoveries, although he was both interested in the efforts of and corresponded with individuals, like Poggio Bracciolini, who were more actively scouring monastic libraries for new classical texts. With more classical texts and authors, and with more manuscript copies of previously known works available, Bruni's contemporaries began comparing works and passages across copies to compare and correct texts. There is little evidence of Bruni's role in these early philological inquiries in Latin manuscripts, but Bruni did offer corrections in Greek manuscripts, making him one of the first individuals to critically emend Greek works (Griffiths et al. 1987).

In addition, Bruni's political career outside of the Florentine chancery helped to change how people thought about the importance of learning as a marker of social status. Highly prestigious governmental appointments in Florence were reserved for key members of the Florentine ruling group. Marriages, meanwhile, occurred between families who could, one way or another, claim equal status within Florentine society. By traditional standards, Bruni should not have had access to either the most significant political offices or major marriage alliances. He was an immigrant from Arezzo and thus could not claim an ancient ancestral history of holding prestigious political office in Florence, a key standard by which social

status was measured. His work as a papal secretary and then chancellor gave him access to political power and secrets, but it was indirect – Bruni was charged with framing the decisions that other people made and keeping to himself the secrets of others. Finally, his economic standing in his youth does not seem to have been particularly exceptional.

However, Bruni used his ability with humanist letters and financial acumen to largely overcome his background and pass down an enhanced social position in Florence to his son. Already by 1427, Bruni was among the wealthiest citizens in Florence (Martines 1963). By that date, he had also cultivated strong connections, both within the Florentine ruling regime and with Pope Martin V, a man who was quite hostile toward Florence during his pontificate but whom, for reasons that remain unclear, Bruni seems to have enjoyed good relations and served as an occasional go-between. In 1426 Bruni secured an election as a diplomat to the pope, the type of position almost always reserved for the more elite members of the Florentine ruling groups. More positions followed in the Florentine domestic sphere. His career reached its peak with his appointment to the *Dieci di Balìa* in (1439, 1440, and 1441). This immensely powerful group was an ad hoc governmental body convened at times of war. Its members were handpicked and as such always featured the key individuals from the Florentine regime. In addition to his great wealth and political status, Bruni's orations, letters, treatises, and translations were known in both Latin and Italian. Not all of Bruni's learned and dilettante contemporaries liked or agreed with Bruni, but his style and contents were a reference point for admirers and detractors alike, across Florence and beyond (Maxson 2014; Martines 1963).

As Bruni's contemporaries argued over whether nobility was an in-born or earned trait, Bruni's success provided a practical example for people who viewed nobility as something that could be attained through the acquisition of wealth, political honors, and displays of humanist learning. People from all walks of life sought to emulate the learning and success of people like Bruni, particularly from the 1420s. The

consequence of this emulation was a change in the social view of humanist learning from a fringe interest associated with a few classical scholars to a necessary component in the education of anybody with social and political aspirations. By the 1480s, just four decades after Bruni's death, a reputation for learning could allow people to overcome other economic, familial, or political shortcomings in their background and be viewed as the equal of people with far greater amounts of the traditional marks of status.

Bruno, Giordano

Born: 1548, Nola, near Naples/Italy

Died: February 17, 1600, Rome/Italy

Fabrizio Meroi

Department of Literature and Philosophy,

University of Trento, Trento, Italy

Abstract

Giordano Bruno is one of the most important philosophers of the Renaissance. His thinking is characterized, on one hand, by a very close relationship with tradition, from which it veers markedly in several essential aspects, but to which it also owes a great debt; on the other hand, it presents some highly original features that, taken together, constitute the mainstay of a new concept of man and a new world view. Bruno's criticism of tradition has three main objectives: Aristotelian philosophy (of which he rejected both the idea of matter as pure power without act, and that of a finite world structured in rigid hierarchies), the Christian religion (in particular several fundamental dogmas, and more generally the passive and defeatist attitude of the faithful who entrust themselves totally to divine will), and humanistic culture itself (of which he primarily rejects the celebration of man, based on an ontological peculiarity that distinguishes man from all other beings). Bruno's thought – also linked in many ways to tradition, especially pre-Socratic philosophy and Platonic and Neoplatonic philosophy – is based instead on the idea of matter itself as generator of forms, the primary source of life and of all that exists; on a cosmological vision that conceives of an infinite universe in constant motion; on a concept of man that while not acknowledging any specificity of a substantial nature, exalts his practical skills to the highest degree, the ethical aspects and the civil vocation (also through the development of disciplines such as mnemonics and natural magic); finally, on a concept of religion, able to maintain the

unbridgeable distance between the human and the divine, but at the same time, encouraging the formation and preservation of forms of solid and fair society.

Biography

Filippo Bruno (who would take the name Giordano upon entering the monastery) was born in Nola, near Naples, in 1548, the son of Fraulissa Savolino and Giovanni Bruno, a soldier. In 1562 he went to Naples, where he initially studied under two teachers: Giovan Vincenzo da Colle called the Sarnese, of Aristotelian-Averroean orientation, and Teofilo da Vairano, Augustinian friar. In 1565, more to be able to continue his studies than due to a real religious vocation, he entered as a novice into the Order of Preachers (that is, the Dominicans) at the Neapolitan convent of San Domenico Maggiore. In 1573 he was ordained as a priest, and in 1575 he earned a degree in theology. In 1576, due to his heterodox opinions and especially his doubts on the dogma of the Trinity, he was forced to leave the monastery of San Domenico Maggiore and fled to Rome, where he settled at the convent of Santa Maria sopra Minerva. However, in the same year he also fled from Rome and began a long journey that, over the years, led him to stay in many towns, wandering all over Europe. Between 1576 and 1581 he moved between Italy, Switzerland, and France; this period is especially memorable for his short stay (in 1579) in Geneva, during which he adhered to Calvinism, and a longer one (1579–1581) in Toulouse, where he taught philosophy at the university.

Between the summer and autumn of 1581 Bruno reached Paris, where he would stay for about a year and a half. During this first stay in Paris he came into contact with the court of Henry III of Valois; he obtained by the sovereign's decree a temporary post teaching philosophy at the University; above all, he composed and published his first important works: *De umbris idearum* and *Cantus Circaeus*, two works on mnemonics that also addressed complex epistemological issues, as well as *Candelaio*, a comedy in

which several cornerstones of his philosophy emerge (from the idea of universal vicissitude to criticism of what he considered to be some of the worst traits of the Christian religion, beginning with excesses of superstition on the part of the faithful). This first visit to Paris was followed by an important period in England. Bruno arrived in London in April 1583, in the train of the French ambassador, Michel de Castelnau, at whose home he stayed. He came into contact with the circles of the court of Queen Elizabeth and became friends with Philip Sidney, one of the foremost figures of sixteenth century British culture. In the summer of 1583, he published other writings on the art of memory (among them *Sigillus sigillorum* stands out) and went to Oxford twice: the first time he participated in a public debate, while during the second he began a course of lectures which were soon interrupted due to an accusation of plagiarism. Between 1584 and 1585, he composed and published the Italian philosophical dialogues (in 1584 *Cena de le Ceneri*, *De la causa, principio et uno*, *De l'infinito, universo e mondi*, and *Spaccio de la bestia trionfante*; in 1585 *Cabala del cavallo pegaseo* and *De gli eroici furori*), a group of works in which he puts forth the essential principles of his thought, between ontological and cosmological research on one hand and ethical-religious inquiry on the other.

From England Bruno returned to Paris in October, 1585. This second sojourn in Paris was shorter than the first and during it (in 1586) he published several works including *Centum et viginti articuli de natura et mundo adversus Peripateticos*, a work with an anti-Aristotelian bent; he also participated in a public dispute at the Collège de Cambrai. Also after the controversy raised by this dispute, Bruno decided to leave France for good and began a new phase in his long European pilgrimage, which would bring him to the territories of the German region. In 1586 after passing through Mainz, Wiesbaden, and Marburg, he arrived at Wittenberg where he settled and with the help of Italian jurist Alberico Gentili, began teaching at the university (lecturing especially on Aristotle's *Organon* and *Rhetorica ad Alexandrum*). Between 1587 and 1588 he composed a series of works on Aristotelian and

Lullian topics, some of which would be published posthumously (among them *Artificium perorandi*, *Lampas triginta statuarum*, and *Libri physicorum Aristotelis explanati*). In March 1588 he left the University of Wittenberg writing the *Oratio valedictoria* (a short but intense text, in which he expresses his gratitude to the academic environment that had welcomed him), and after a 6-month stay in Prague, where he published, among others, *Articuli adversus mathematicos*, Bruno arrived in Helmstedt. Here he began to compose the set of works dedicated to magic that would all be published only posthumously in the late nineteenth century, and joined the university, but also as a result of excommunication by the local Lutheran church decided to move in June 1590 to Frankfurt, where he lodged at the Carmelite convent. The year 1591 was especially intense for Bruno, who went for a few months to Switzerland and in Frankfurt published both *De imaginum, signorum et idearum compositione*, another work on mnemonics, and the so-called Latin poems, which are in some ways the culmination of his thought: *De triplici minimo et mensura*, *De monade, numero et figura*, and *De immenso et innumerabilibus*. But 1591 was also the year that saw Bruno's return to Italy: at the end of the summer he accepted the invitation of the Venetian patrician Giovanni Mocenigo, to move to the city of the Doges.

Bruno arrived in Venice the following fall, but almost immediately went on to Padua, where he taught a short course for German students of the university and composed some minor works. However, at the beginning of winter he returned to Venice, and by the end of March 1592 he settled in the abode of Mocenigo. But on May 23 the latter reported him to the Inquisition, accusing him of having beliefs contrary to the Christian religion and Bruno was imprisoned on the same day. Thus began a long legal procedure that consisted of a first phase in Venice and a second phase in Rome. The first part of the trial concluded with a formal retraction by Bruno, who on July 30 declared he repented of his mistakes and was willing to ask for forgiveness. But the Roman Inquisition required the transfer of the trial from Venice to Rome and on February 27, 1593 Bruno

entered the Roman prison of Sant'Uffizio. The second part of the trial, which lasted for several years, had many ups and downs and accelerated over the course of 1599; Bruno, who on January 12 was asked to recant eight propositions – judged heretical – taken from his writings and his testimony during the trial, said he was willing to do it at first but then changed his mind, until on December 21 he said he did not wish to repent and, indeed, did not know what he should repent about. The sentence was inevitable at this point, and on February 17, 1600, Bruno was burned at the stake in the Roman square of Campo de' Fiori.

Heritage and Rupture with Tradition

Bruno's thought develops and defines itself in direct opposition to Aristotelian tradition on the more strictly philosophical level, to the Christian tradition on the religious level, and to the humanistic tradition itself in terms of the specific understanding of the knowledge and understanding of man. In all three cases, the central category is "pedantry," which Bruno often used to indicate the intellectual attitude of representatives of these traditions. In a philosophical context, the "pedants" are those who interpret Aristotle's thought in order to repeat and perpetuate his countless errors, thus becoming the main cause of the decline of philosophy which Bruno identifies as one of the negative traits of his era. In the religious sphere, the "pedants" are the followers of Christianity, a form of religion from which Bruno began to distance himself, on several key points, since his formative years spent in the convent of San Domenico Maggiore in Naples; and from which he would depart definitively as soon as his thought took on precise contours. Finally, in Bruno's eyes humanists also appear "pedantic," or more precisely, those humanities scholars who favor the most empty and inconclusive knowledge, which is – according to Bruno – erudition for its own sake, the arid investigation of grammar and language, and a kind of fetishistic cult for words (i.e., the form), whereas what really matters are the concepts (i.e., content). Bruno's criticism of these three kinds of "pedantry" is very broad and

diverse and at least the most important aspects should be explored.

As regards the criticism of Aristotle and the Aristotelian tradition, the issue is primarily ontological and cosmological, and individual points on which Bruno focuses concern the idea of matter on one hand and the concept of the physical world on the other. According to Aristotle and his followers, matter is a *prope nihil* (an "almost nothing"), mere power without act, which can reach perfection only by receiving a form from the outside and expressing itself in it. Bruno, in the pages of *De la causa, principio et uno*, completely reverses this idea and – partly inspired by the medieval philosopher David de Dinant – conceives of matter as something that already contains in itself, implied, all possible forms; as an entity, that is, which does not receive from time to time its form from the outside but generates it itself, power which in a sense is already act, inexhaustible source of reality and reality itself. For Bruno, moreover, matter is a universal and disembodied entity that arises at the basis of both the bodily and the disembodied substance, depending on whether it is to be carried out in a dimension of multiplicity or unity, temporality or eternity, and the extended or unextended. And – most importantly – it is finally possible to also identify in matter as well as the root of life itself in all its shapes and ways, a principle of divine nature, whose existence and whose presence in reality permit one to think of infinite matter, infinite life, and infinite universe. It is, in short, the idea that is the basis of all Bruno's philosophy, which has been rightly defined as the idea of "infinite Life-matter" (Ciliberto 1990), an idea to which are indissolubly bound some other theoretical acquisitions of paramount importance. First, to a perspective such as this, dominated by the idea of a matter endowed with its own life that eternally and continuously produces different shapes, compounds, and individuals, the concept of death is quite alien, if by death one means the total end of life, the exhaustion of the vital principle; that which "dies," that which ends, is only the compound, i.e., the single form taken from the material on any particular occasion, while the life inherent in it and propagated by it never ends.

Secondly, the idea of “infinite Life-matter” is closely related to that of “vicissitude,” a true underlying structure of being at every level; all beings – thus all those endowed with life, so-called living beings as well as that which is apparently inanimate – are governed by a single vicissitudinal principle which determines the various events and continuous transformations, in an overall scenario in which, then, life does not have to deal with death but rather, simply, with mutation. Thirdly and most importantly, the idea of “infinite Life-matter” produces the decisive consequences that drive Bruno – and so we come to the other side of the criticism of Aristotelianism – to reject with great firmness, especially in the pages of *Cena de le Ceneri* and those of *De l’infinito, universo e mondi*, Aristotelian cosmological vision. First of all, the whole of reality as understood by Bruno, all given life and all governed by the vicissitudinal principle, is obviously in constant motion; thus even the motion of the earth, which is a being like any other, must be recognized and affirmed, against all evidence of the senses and contrary to the opinion of Aristotle. Then, reality according to Bruno is also characterized by a profound unity and substantial homogeneity, resulting from the fact that beyond any formal difference and any specific peculiarity, any being may be placed on the same footing as the others by virtue of its participation in substance and universal life; for which any hierarchical distinction regarding the Aristotelian cosmos falls away. Finally, due to the continuous and eternal production of forms of life by matter – as previously mentioned – it is impossible not to imagine an infinite universe and, within it, the existence of infinite living worlds; and it is precisely this theoretical fact that made Bruno famous in the history of Western thought, and which – as far as is relevant here – distances him from Aristotle’s cosmological concept in general and his idea of a unique, finite world in particular.

Regarding instead the critique of Christianity, it must immediately be said that Bruno believes some basic tenets are unacceptable, especially those of the Trinity and the Incarnation. We have just seen that Bruno admits the presence of a divine principle at the very heart of reality; this

does not mean, however, that he was not firmly convinced of the existence of an actual deity, unique, belonging to the realm of the supersensible and separate from the scope of the human and the tangible by an unbridgeable distance. From this point of view, it is evident that a theological perspective such as that of the Trinity, which effectively splits the divine entity into three different (though coessential) parts, cannot be shared; and indeed Bruno, also influenced by the Aryan heresy, already expressed his doubts about this dogma in his youth and later repeats them, even before the inquisitors during the Venetian phase of the trial (Firpo 1993). Equally – and even more so – it is clear that even the dogma of the Incarnation cannot be shared, which is the belief that God could become man, that the distance between the divine and the human could somehow be overcome; and indeed Bruno, in the final pages of the *Dialogo terzo* of *Spaccio de la bestia trionfante*, makes the figure of Christ himself, half man and half God, subject to a merciless parody and ironically likens it to that of the mythological centaur Chiron, half man and half animal. More generally, however, there are several other aspects of the Christian religion which fall under the ax of Bruno’s criticism. First of all, on several occasions – such as in *Candelaio*, the Neapolitan comedy written during his first stay in France, a work that stigmatizes various forms of human stupidity – Bruno attacks with ferocious satire the more exterior and questionable aspects of Christianity, behaviors that make authentic devotion degenerate into mere superstition, intellectual poverty, and corruption of the morals of the clergy and religious orders. Then, especially in the early sections of *Cabala del cavallo pegaseo*, Bruno’s criticism focuses on the attitude of Christians as a whole: an attitude that is systematically defined as “asininity” and that translates, in fact, into a state of total passivity, lived in the renunciation of the use of the properly human powers and prerogatives and in the perennial waiting and docile acceptance of the decisions of the divine will. Finally, special attention is given to that part of Christianity represented by Protestantism. The sixteenth century, as is well known, is a century profoundly marked by the advent of the

Reformation and religious and cultural debate as well as by the historical events that originate from it. And Bruno, who in the first phase of his European pilgrimage came into direct contact with the dramatic reality of the wars of religion and the bitter religious, social, and political clashes related to them, took up his precise position condemning in no uncertain terms, especially in the pages of *Spaccio de la bestia trionfante*, the Christianity of the Reformation, to which he imputes – among other things – remaining tied to a barren and misleading purely literal interpretation of the Scriptures; to be a religious front anything but united, indeed rent internally by innumerable fragmentations; to have turned Europe into a vast battlefield, by provoking the wars of religion; having unlawfully taken possession of those structures – churches, libraries, universities – which had been previously created by others; and more than any other thing, to have taken to the extremes the fundamental error of Christianity (which consists in having spread a doctrine that prevents any independent initiative by humans) through a marked accentuation of the Pauline concepts of “justification by faith alone” (i.e., salvation without the need to do good works) and “predestination.” Important, in relation to the latter point, is the fact that Bruno found himself in a head-on conflict both with a fundamental text from the origins of Christianity, the letters of Paul of Tarsus, referred to several times in his works (Meroi 2003), and with one of the most significant texts of sixteenth century Reformed Christianity as *De servo arbitrio* (1525) by Martin Luther, lurking in the background in many pages of the *Spaccio* (Ciliberto 1985).

Thus Bruno severely criticizes two traditions thousands of years old, the Aristotelian and the Christian; but he also distances himself, with his thoughts and his work, from a far more recent – but no less solid – tradition, humanism. Again, he criticizes humanism for empty erudition and philological excesses, i.e., a maniacal attention to the purely formal aspect of texts, so as to lose sight of the more important part, content. And in doing so, Bruno captures very well what actually is a limit, at least of a certain humanism; but his criticism does not stop at this unique aspect. Obviously,

humanistic culture was not only scholarship and philology in the worst sense; it was also – and most importantly – a sincere and convinced appreciation of the role that humanity can – and should – play in its most intimate context, namely that of a comparison at the same time conscious and ambitious with nature, with history, with one’s own kind, and also with God. But then, such an appreciation ended very often in a celebration, sometimes rich in rhetorical tones, of the objective greatness of the human being and his absolute centrality in the context of the natural and animal world; a celebration made possible mainly by the fact that man was attributed – even based on an anthropological model of Aristotelian origin – with the exclusive possession of certain faculties (first and foremost, the intellect) considered lacking in other living beings. So it is against a concept of this sort that Bruno above all argues, and his distance from the humanistic tradition is greatest at this point. In common with the humanistic perspective – it must be said – Bruno certainly has, on one hand, the idea that man should be well aware of his limitations and on the other hand simultaneously recognizes his privileged status, but this recognition – as we shall see – is based on completely different grounds, not on the possession of substantial characteristics that in other beings – indeed, other entities – are lacking. As we have seen, the idea of “infinite Life-matter” leads Bruno to conceive of a universe populated by beings and entities that all participate equally, although to a greater or lesser extent, in the same life and the same matter, so that it is impossible to imagine any real differences in quality among them – if there are differences, they are only of quantity. And, since unique and universal matter is both corporeal and incorporeal, there can be no substantial differences either on the material or on the spiritual plane. Finally, it follows then that a faculty such as that of the intellect cannot in any way constitute a sufficient reason for declaring the superiority of man over other beings, since they too possess it in some way. Bruno’s anti-humanism thus consists precisely and essentially of this radical reassessment of exquisitely human prerogatives, reaching its peak in the first part of the *Dialogo secondo* of *Cabala del cavallo*

pegaseo, where a heated confrontation between man and beast occurs, culminating in a paradoxical and provocative alternative: or one is willing – considering what some of them are able to do – to admit that also animals have an intellect, or one must recognize – if one does not wish to abandon the traditional distinction between intellect and instinct, which guarantees the specificity of man – that animal instinct is worth more than human intellect.

Moreover, the fact that Bruno elaborates his philosophy in direct opposition to most preceding knowledge and doctrines does not mean that many threads do not bind him closely to various other aspects of the tradition, from antiquity to the Renaissance itself. Regarding ancient and late classical thought, we must recall the frequent presence in Bruno's writings of hints and references, explicit or implied, to the pre-Socratic thinkers, from Parmenides and Pythagoras to Empedocles and Heraclitus. But we must also recall that Bruno was greatly influenced by Hermetic texts, that is, by the *corpus* of writings of the Hellenistic period on magical-astrological and religious-philosophical subjects, that Renaissance thinkers – and Bruno with them – believed to be the work of Hermes Trismegistus, a legendary figure of wisdom, with almost divine traits, whose authority was considered equal, if not superior, to that of the greatest sages of the ancient world; in particular, Bruno takes from the hermetic text *Asclepius* – a part of which appears, translated from the Latin in an almost literal way, in the *Dialogo terzo* of *Spaccio de la bestia trionfante* – the idea of an apocalyptic dimension in the sense of the imminent coming of new times and new worlds that would put an end to an age of decadence (Ciliberto 2002). Nor can we forget Bruno's great debt to Plato himself and Neoplatonism (as we will also see shortly, dealing with the Renaissance thinkers who continued this line of thought): basic ideas such as the existence of an intangible world clearly distinct from the tangible yet in close relationship with it, or that of a reality divided into several levels, from unity to multiplicity and vice versa – although reworked in an original way – are real cornerstones of Bruno's philosophy. And finally, we cannot neglect to

emphasize the fact that even in the face of criticism that could be called “global” of the entire Christian tradition, from its origins to its most recent manifestations, Bruno frequently draws inspiration from the content of biblical books such as *Job* and the *Song of Songs* (Tirinnanzi 1999; Bassi 2008). Regarding later medieval thought, we have already mentioned the role played by David de Dinant in the development of Bruno's idea of matter; and we must add here that, despite Bruno's overall detachment from a tradition – such as the medieval one – that for him represented precisely the set of theoretical orientations to which he intended to oppose his new philosophy, his sincere appreciation for some other thinkers belonging to it must be mentioned. This is the case, for example, with certain Arab authors such as Avicenna (also called upon for his views on the concept of matter) and Averroes; but it is also the case of Thomas Aquinas, the highest representative of that scholastic philosophy of Aristotelian imprint which was for Bruno the main obstacle to overcome, but whose intelligence and wisdom he held in the highest regard (as he also reminded his Venetian inquisitors: Firpo 1993). Finally, regarding the thought of the Renaissance, it is necessary to dwell briefly on the relationship between Bruno and at least four authors of the fifteenth and sixteenth centuries, who beyond his aforementioned negative judgment on the humanistic conception of man, were for him of undoubted and remarkable importance: Nicholas of Cusa, Marsilio Ficino, Desiderius Erasmus, and Nicolaus Copernicus.

Bruno often refers explicitly to the first and last of these authors, considering them both thinkers who had taken decisive steps on the path to overcoming Aristotelian-Ptolemaic cosmology and, especially, geocentrism. Nicholas of Cusa especially had the merit – according to Bruno – of anticipating several key points of the new cosmological vision, particularly in his work *De docta ignorantia* (1440): the nonexistence of fixed stars, the absence of an absolute center, the resulting equivalence of all points in space, the motion of the Earth, the possibility that other planets are inhabited, the relativity of motion and the infinite nature of the universe; while heliocentrism as

illustrated by Copernicus in his famous *De revolutionibus orbium coelestium* (1543), a work in which the motion of the Earth is also affirmed and explained, would be truly – according to Bruno – the cornerstone of a new cosmology. But then, Bruno believes that neither Nicholas of Cusa nor Copernicus followed through to the end, that is, they did not develop their thinking to its ultimate consequence, which should have been unconditional adhesion to a genuine vision of an infinite universe: in fact, Nicholas of Cusa would come to imagine an infinite universe, but only in a negative sense, due to deprivation and lack of precision, that is, simply because he thought it was not possible to define it exactly; and Copernicus, on his part, would in fact remain linked to the Aristotelian-Ptolemaic theory of a finite universe bounded by the motionless sky of the fixed stars (which, however, is objectively true). Bruno also profoundly reworks Copernican heliocentrism, turning it in the direction of the infinite, which in fact is totally foreign to Copernicus: in Bruno's new universe the heliocentric idea remains, of course, but applied – inevitably, one might say – in an infinite number of suns and solar systems. In any case, despite these criticisms, Bruno's debt to these two Renaissance thinkers is great, and no less, certainly, than to the other two thinkers named above. Ficino, as is well known, is the leading exponent of the Platonic and Neoplatonic school of thought that flourished in Italy, in Florence of the Medici, in the second half of the fifteenth century (known as the Platonic Academy). In the culture of the time, this intellectual phenomenon was a kind of reaction distancing itself from Aristotelian tradition and in that sense it was almost natural for Bruno to turn his attention to the works of Ficino, in which he could find, replicated in an abundance of topics and illuminated by a new light, themes and motifs belonging to a theoretical orientation to which he too looked with great interest. Among the many points of contact between the thought of Ficino and of Bruno we can highlight two in particular (though closely related): first, the idea of a universe that while characterized by obvious differences and varying degrees of perfection, appears to be substantially homogeneous, marked

by an indelible divine imprint, and all animated by active forces and deep spiritual affinities; second, the absolutely central role attributed to love, which conceived of as a vital principle and as an existential category rather than as mere sentiment, has the task of raising man from the mere desire for worldly sensuous beauty to the highest contemplation of beauty in itself and the divine splendor that illuminates all things. Finally, regarding Erasmus, the European humanist par excellence, his influence on Bruno can be divided into two stages: at first, coinciding with Bruno's years in the convent of San Domenico Maggiore, reading Erasmus' works was decisive in Bruno's abandonment of a Christianity oriented in a predominantly devotional direction and weighed down by strictly theological subtleties; at a later time, coinciding instead with the more mature phase of Bruno's theoretical reflection, then when the final separation from the Christian religion was accomplished, Erasmus was still, for Bruno, a valuable source – and virtually limitless, considering the copious production of the Dutch humanist – on which he drew to take up and develop individual motifs of various kinds. But, also concerning Ficino and Erasmus, along with notable elements of proximity, one must also take into account their fundamental distance from Bruno: on the one hand, Ficino's Platonism is decidedly Christian in nature and the universe he imagines is totally dependent on God, which coincides with the God of the Christian religion; on the other hand, Erasmus' humanism itself, although highly critical of certain aspects of Christianity (and this is, more than anything, a sure reason for agreement with Bruno), cannot even be conceived outside of it. Evidently, in both cases, they deal with general points of view that the Bruno of the English dialogues and later works could not share at all as a whole.

Innovative and Original Aspects

As we have seen, from the moment Bruno was forced from the very outset to confront preceding philosophical and religious doctrines and at the same time develop his theoretical reflections in

close dialectical relationship with them, it would have been difficult, dealing with the main points of his departure from tradition, to do so without treating some of the most innovative aspects of his thought, from the idea of “infinite Life-matter” and that of “vicissitude” to the new cosmological vision and the development of a global perspective that was exquisitely anti-Christian and anti-humanistic. Thus, we must now integrate what has already been mentioned, taking up some of the issues already addressed and examining further elements of originality in Bruno’s philosophy, taking into account – in order – the ontological, anthropological, epistemological, and ethical-religious aspects.

Regarding the ontological aspect, it must first be specified that the concept of “infinite Life-matter,” essentially established in the pages of the London dialogue *De la causa, principio et uno*, is taken up and carried in a direction decidedly atomistic in one of the three Frankfurt poems, specifically *De triplici minimo et mensura*. In this work of fundamental importance Bruno, after having distinguished between the minimum in the metaphysical sense (consisting of the monad), the minimum in the physical sense (consisting of the atom), and the minimum in the geometric sense (consisting of the point), focuses in particular on the second, making the atom, the smallest indivisible physical entity, the ultimate foundation of all reality. Bruno’s concept of a living, eternal, unique, and infinite matter, is thus completed with the identification of an infinite number of physical particles that make it up, all identical and eternal, which, combining with one another according to infinite possibilities and infinite ways, give origin – and life – to infinite bodies and infinite entities. The infinite production of “infinite Life-matter” thus coincides with the incessant movement and action of individual and innumerable atoms; and this further determination of the Bruno’s ontology – one may observe – still moves in a radically anti-Aristotelian direction: on one hand, the existence of atoms, which are all strictly indivisible, shows the profoundly erroneous nature of the Aristotelian theory of the infinite divisibility of matter (a theory, which however already contradicts the idea of a finite world,

since it is absurd – Bruno notes – that a finite amount can be divided into infinite parts); on the other hand, the fact that the atoms are all strictly identical removes any legitimacy – more than the idea of “infinite Life-matter” itself already does – from the hierarchical distinctions that Aristotle introduces in reality, instead attesting to the constitutive units of the universe and the substantial identity of all its parts. This atomistic outcome is, in short, a very significant development of Bruno’s concept of matter; but, at this point, it must be pointed out that this concept is directly linked to a highly qualifying aspect of Bruno’s thought: the theory of metempsychosis. Even before *De minimo*, with the consequences we have just seen, the reflections in *De la causa* are taken up in *Cabala del cavallo pegaseo*, a short but very complex text in which Bruno presents his ideas with particular energy. In the first part of the *Dialogo secondo* of the penultimate London dialogue – previously mentioned regarding the confrontation between man and animal concerning the possession of intellect – the absolute identity of both the bodily substance and the incorporeal substance is reaffirmed with extreme decision. From this derives above all the essential equality of all beings, which in these pages is amply illustrated through a rich set of references to the almost total absence of differences between the nature and behavior of men on one hand and those of animals on the other. But from the particular identity of incorporeal substance, that is the spiritual, also derives the possibility that individual souls incarnate all the same in any body, in the universal rhythm of “vicissitude” and without hindrance of any kind. That is why Bruno, in a manner fully consistent with the ontological presuppositions of his thought, firmly believes in the transmigration of souls, as suggested in the aforementioned section in *Cabala*, in which he also appeals to the Pythagorean doctrines and the narrative of Virgil in the sixth book of *Aeneid*; and as he argues explicitly – distinguishing, however, between the religious and philosophical levels – before his Venetian inquisitors (Firpo 1993).

It is also necessary to refer to the same section of the *Cabala* to better delineate the contours of Bruno’s anthropology, that is, Bruno’s concept

of man. By treating his anti-humanism, we have already hinted that Bruno indeed recognizes the privileged status of man in relation to other living beings, but that this recognition is not based on his higher nature or the exclusive possession of specific faculties. It is precisely in these pages that it is revealed why man can dominate animals and therefore be defined, at least in a sense, “the god of the earth”; the superiority of man does not depend on substantial grounds, but only on the factor, purely accidental, of his “complexion,” i.e., his exterior constitution. In particular, if man can perform certain operations that allow him, objectively, to occupy a position of preeminence in the realm of nature and, above all, to dominate other living beings, it is only because he can count on the contribution of the hand, that is, of a single component of his purely physical structure (which could also have been different); a component that ultimately turns out to be the true element to which he owes his greatness. However, we must make two clarifications in this regard. First, it must be said that in spite of this unique celebration of the hand that we find in the *Cabala*, in a work of just a few months earlier, *Spaccio de la bestia trionfante*, instead we find a joint celebration of hand and intellect. In the first part of the *Dialogo terzo* of the fourth London dialogue, in fact, Bruno also identified in the possession of the intellect, as well as that of hand, the datum at the origin of the peculiarities of the human being. But although this might seem like a contradiction, it is explained, on one hand, by the fact that compared to the *Cabala*, *Spaccio* is a text in which Bruno, struggling with questions that are essentially moral, does not draw the most extreme consequences from the ontological premises of his thought (as he does, in fact, in *Cabala*); on the other hand, by the fact that on closer inspection, Bruno’s entire reflection is characterized by a nearly constant variation of the same basic reasons that determine its complexity and richness; Bruno’s thought is truly one that develops in an original and creative way, from time to time confronting different issues and continually reorganizing the theoretical material that accompanies it. The second clarification refers to a fundamental aspect of Bruno’s philosophy, also

concerning his relationship with humanism. The praise of the hand, whether accompanied by that of the intellect or not, fits perfectly – and indeed provides a crucial element – with the exquisitely practical vocation of Bruno’s thought. In reality, if the theme of the hand, as presented in *Spaccio* and especially in *Cabala*, helps to clearly reduce the claim of human excellence at every level (and, in this sense, the position taken by Bruno radically surpasses the typically humanistic idea of *dignitas hominis*, as proposed, for example, by Giovanni Pico della Mirandola in his famous *Discorso sulla dignità dell’uomo*, 1486), on the other hand, this issue has also – and probably most importantly – the function of enhancing the aspect of the *praxis*, i.e., those operational capabilities and the freedom of action which, if properly exploited, allow people to play an active and constructive role in both civil and political (and from this point of view, Bruno seems to be quite in tune with the call to *agere et intelligere*, seamlessly, which is done by an author such as Giannozzo Manetti, in his treatise *De dignitate et excellentia hominis*, 1452).

Regarding Bruno’s refusal of the Christian dogma of the Trinity, we have already had occasion to mention the idea of the unbridgeable gap which separates the human from the divine, the sensible from the supersensible, and the finite from the infinite. It is true that the divine is present in the world in a substantial way, both as a generative principle of life and reality, and as a condition of possibility of the infinite nature of the universe; but, considered in itself, in its unity and in its purity, it remains unattainable by man, who is a constitutionally finite being and basically bound to sensible reality. This idea is another cornerstone of the ontological conception of Bruno; but at the same time, it is also the basis of his epistemological concept, namely, of his theory of knowledge. Just as man is unable to establish a direct contact with the deity, he is not able, in fact, to arrive at a full and complete knowledge of the truth. Drawing inspiration from ancient philosophy (in particular the “myth of the cave” in Plato’s *Republic*), as well as from ideas of biblical origin (in particular the figure of the “beautiful Shulamite” in the *Song of Songs*),

Bruno treats this fundamental subject recurring in many of his works (from *De umbris idearum* to *De gli eroici furori*) to the symbolic motif of the “shadow”: structurally unable to grasp the divine in its true essence and eternal glory, as well as to be illuminated by the essential causes of things, human knowledge seems hopelessly limited and, in fact, shadowy. This does not mean, however, that to the man is not granted any form of knowledge. This shadow is not total darkness, but rather an intermediate state between full light and darkness. And before man, in reality, infinite possibilities of knowledge open up, as infinite as the world in which he is living. In this sense, Bruno’s perspective, far from being a vision that annihilates man’s cognitive abilities, strictly functions as a true celebration of them: in fact, Bruno is firmly convinced of the possibility and need, on the part of man, to take full advantage of all the intellectual faculties in his possession, even with full awareness of his limitations. For that matter, this explains his critique of skeptical philosophy that took shape in the third part of the *Dialogo secondo di Cabala del cavallo pegaseo*. Among the various forms in which “asininity” (that is, ignorance) manifests itself, skepticism is without a doubt the most insidious: the skeptics, by saying that nothing can be known with certainty, programmatically waive any type of knowledge; and worse, they do so by arguing their reasons at length and presenting their intellectual attitude as an authentic form of philosophy – i.e., using those same cognitive tools that they question. Instead, for Bruno philosophy is, in the highest degree, free and continuous aspiration to knowledge – in spite of its constitutively shadowy nature. However, this picture would be incomplete if we did not mention another aspect of Bruno’s epistemological reflection, an aspect that changes – at least in part – the scenario so far. In *De gli eroici furori*, the last of the London dialogues, Bruno clearly distinguishes the figure of the “wise” from that of “furious,” characterizing them as follows: the wise man stops at a degree of knowledge which has its highest point in the intellectual contemplation of the vicissitudinal mutation that structures all planes of reality, thus reaching a level of wisdom that perfectly embodies the shadowy

dimension; the furious, however, is not content with this and tries to push his knowledge beyond the limits granted to man, relying not only on the senses and the intellect but also the will and, above all, abandoning himself to the bond of love in an attempt to arrive at a deeper and more authentic vision of reality. That connected to fury is thus an extraordinary experience, in which intellectual energies merge with those of feeling, allowing the furious to catch a momentary glimpse of unity in diversity, the complicated in the explained, the supersensible light and truth behind shadows and sensible appearances. But it is also an experience destined ultimately to fail: human and divine planes cannot meet in a complete, definitive way; and the condition of the furious remains inevitably fleeting, a state of consciousness that is absolutely impossible to stabilize. At the same time, what he manages to do is extraordinary; and the pages that Bruno devoted to the experience of fury and the figure of the furious are one of the highest pinnacles of his work and thought.

But now we come to the ethico-religious aspect. Strictly speaking, the absolute substantial identity of entities established on an ontological level and the consequent total confirmation of the human events and destinies determined by the rhythm and cycle of vicissitude should leave no room for a qualitative differentiation of the behaviors of individuals. Yet, despite this, Bruno still wants to preserve the ability to recognize – and reward – the value of right action, and in the pages of *Spaccio de la bestia trionfante*, expends greater effort to achieve this goal. *Spaccio* is a magnificent fresco with a mythological background, in which imagining that Jupiter wants to cleanse the world of the gods, marked by a profound moral decay, Bruno lays the foundation for a general reform, first of all of ethics, but also of political and religious society. The purpose of Jupiter – and Bruno – is the systematic replacement of each vice with a specific virtue, and in this context, moral values such as commitment, merit, and justice are enhanced. Bruno fights a dual battle: on the one hand, against any conception that includes a universe dominated by pure chance and blind luck, in which every action is equivalent to another, and

every attitude is lawful; on the other hand, against those who consider the greatest virtue to be idleness and disengagement, rather than exhort men to an ongoing, constructive, and just activity. In this sense, it is no coincidence that – as we have seen – in *Spaccio* itself Bruno polemicizes in the most direct and violent way against Protestants who, resting on theological positions that lead them to believe that everything is already decided (“predestination”) and deprive good deeds of any actual weight (“justification by faith alone”), are thus proponents of a worldview profoundly fatalistic and idle. Nor is it a coincidence that in *Spaccio* itself Bruno proposes a practical alternative of a religious sort. In the face of faults and damages caused, in his opinion, by Christianity in general and reformed Christianity in particular, he looks positively to the religion of the Egyptians as well as that of the Romans. The first is a religion of purely natural origin. The inhabitants of ancient Egypt were well aware of the presence of divinity in nature and therefore represented and worshiped their gods in animal form, thus establishing an organic relationship – beyond the ontological distance that separates them – between the divine world and the natural world and at the same time, between divine justice and human justice. That of ancient Rome, on the other hand, is a heroic religion with a marked civil vocation. The Romans deified heroes in fact, as those who stood out for their virtues, and were able to perform feats of exceptional greatness; in doing so, they established very high standards of behavior, to be imitated by aiming at the construction and maintenance of a just and organized society (for this exploitation of Roman religion Bruno also drew inspiration from *Discorsi sulla prima decadi Tito Livio* by Niccolò Machiavelli, 1531). Thus for Bruno the ideal religion is one founded on natural bases and aiming at the development of civilization. And this all in all instrumental idea of religion – that is, a religion must be judged not so much for itself, but for its consequences on a civil level – is confirmed by Bruno’s substantial indifference to the historical religions. If Bruno momentarily adhered to Calvinism when he was in Geneva in 1579, and if, before the inquisitors during the Venetian phase of the trial, he was

willing to at least partially put into question his beliefs, it was not a form of inconsistency but because for him the validity of individual religious denominations was purely relative and depended, in the final analysis, not on choices of faith but on strictly philosophical reasons, or even simple reasons of expediency. This explains as well that sort of recovery of Catholicism that takes place in the final pages of *Spaccio* itself, in which Henry III of France is celebrated as a perfect Christian king: before the theological errors of Reformed Christianity and the social unrest it provoked, Catholic Christianity is preferable – as a “lesser evil,” one might say – purged of its faults and exclusively for the benefits it can offer society, by virtue of the value attributed to doing good works.

This is the overall picture of Bruno’s philosophy, considered in its essential features and in its internal articulations. However, this view would be incomplete if one did not mention in conclusion, the other two sides of theoretical – and practical – Bruno’s thought, very peculiar and themselves very relevant: that of magic and that of mnemonics, or the art of memory. A large part of Bruno’s production consists of the so-called “magic works,” a series of writings that place Bruno in the tradition of Renaissance natural magic, where he repropose and reformulates various aspects independently. That of natural magic is a very important strand in Renaissance thought, with one of its principal founding texts in *De vita coelitus comparanda* (1489) by Marsilio Ficino and developing in the sixteenth century through the work of authors such as Cornelius Agrippa, Girolamo Cardano, and Giovan Battista Della Porta. Beyond the differences that characterize the approaches of individual thinkers, it is possible to identify some common and distinctive features: magic, if properly understood, has nothing supernatural about it, and consists simply in the knowledge of natural principles and in their use for beneficial purposes; the magician, then, is nothing more than the supreme sage, that is, one who is able to grasp and exploit all the properties of the natural elements, even those that remain hidden to other men; of these properties, those that combine entities on the basis of relationships of attraction

(“liking”) or repulsion (“dislike”) stand out, thus creating a network of connections that pervades the whole of reality, and that the magician can precisely manipulate and direct to his liking; magical knowledge, in the light of all this, does not in any way conflict with the Christian religion, since its practical outlet, the magic act, being based on strictly natural assumptions, is clearly distinguishable from the miracle, which instead is supernatural and can be accomplished only by God or by those with divine powers. On the whole, this is Bruno’s perspective, while he introduces some variants of absolute importance. First, he insists in a particular way and with great originality (especially in works such as *De magia naturali* and *De vinculis in genere*) on the theme of “bond”: the magician is one who acts not so much on things as on people, binding them to himself and thus being able to pursue his aims in essentially social and political terms, such as laying the foundations for a reform of customs and institutions; and, in this sense, the practice of natural magic is the culmination of the aforementioned practical aspect of Bruno’s philosophy (Scapparone and Tirinnanzi 1997). Second, a fundamental emphasis is placed, in the context of the magical performance of the act, to the role played by *fides* (“faith and trust”): showing himself to be perfectly aware of the psychological aspects of the relationship between men, Bruno theorizes about the impossibility of a successful magical act in the absence of a positive predisposition on the part of the onlookers, so if they do not believe in the ability of the magician, he cannot exert any suggestion on them and is doomed to failure (Meroi 2007). Thirdly, in Bruno’s view natural magic lacks any religious tinge: Bruno, unlike most Renaissance authors who deal with natural magic, does not even bother to reconcile his position with the Christian vision of the world and thus has no problem distinguishing the magic act from the miracle; in fact, for him Christ was a simple wizard who as such could perform his alleged miracles in the appropriate circumstances, but could not do so in their absence (Scapparone 2007).

If the “magic works” are concentrated in a chronologically advanced stage of Bruno’s activity (around 1590), the mnemonic writings – from *De umbris idearum* and *Cantus Circaeus* to

Sigillus sigillorum and *De imaginum, signorum et idearum compositione* – are located throughout his entire intellectual production, confirming the great importance he attached to this particular field of knowledge. The art of memory, that is the set of techniques for better remembering concepts by linking them to a sequence of images arranged in a specific order, is rooted in classical antiquity when authors such as Cicero and Quintilian made it an integral part of rhetoric; and it enjoyed particular fortune during the Middle Ages and the Renaissance, when it was used mainly by religious preachers, especially Franciscans and Dominicans. Bruno, educated in a Dominican convent, was quite familiar with these techniques and made extensive use of them; although, as in the case of natural magic, even in this case his approach was not limited to a simple passive recovery of tradition. From a purely technical point of view, Bruno’s mnemonics is actually not very different from the traditional one, since it also relies on the use of images and their ideal locations; but what changes, compared to tradition, is the very concept of the art of memory and its aims. In Bruno the cognitive value of the art of memory is not limited to better management of knowledge already gained through the enhancement of mnemonic activity, but it can also be considered a means of acquiring new knowledge. For Bruno, in fact, if the creation of a system of relations between concepts, images, and locations does not occur in an external manner (that is, based on more or less random combinations) but in an organic way (i.e., taking into account the actual connections between the different components of the system and giving rise to new horizons of meaning), then the profound analogy appears obvious between the art of memory and the action of nature itself, which constantly produces new entities from existing ones and continually transforms the appearance and configuration of reality. The art of memory is thus an absolutely privileged tool for penetrating the secrets of nature and better understanding the dynamics of the progress of the real, since it reproduces nature’s mechanisms and creative effects. And one can clearly see, finally, that in this way the exercise of mnemonics and theory related to it

are anything but secondary in the complex and rich philosophy of Bruno.

Impact and Legacy

Bruno's works were included in the Index of forbidden books of the Catholic Church in 1603, i.e., shortly after his death; despite this, they enjoyed considerable circulation throughout Europe over the following centuries, ensuring that Bruno's ideas were widely discussed and were the subject of often conflicting opinions. During the seventeenth century the debate focused mainly on ontological and cosmological issues, as well as on the problem of Bruno's atheism. Let us see some examples. In a letter to Galileo Galilei on April 19, 1610 Johannes Kepler, while not hiding a certain sympathy for the figure of Bruno, decidedly distances himself from his infinitist cosmological hypothesis. And an orthodox thinker like the Franciscan friar Marin Mersenne, in his polemical work entitled *L'impieté des Deïstes* (1624), condemns Bruno in no uncertain terms because he believes that his concept of an infinite universe, and in particular his belief that from an infinite cause must necessarily derive an infinite effect, lead inevitably to assume the coincidence in God of freedom and necessity, and thus deprive God of his own freedom. Instead a positive judgment is made by Gabriel Naudé, who in *Apologie pour tous les grands personnages qui ont été faussement soupçonnés de magie* (1653) recognizes Bruno's merit in having contributed in a decisive way, through his research, to setting humanity on a path toward knowledge of nature on purely rational bases and free from any kind of constraint or coercion. On the other hand Pierre Bayle, in the pages of the article on Bruno in his famous *Dictionnaire historique et critique* (1697), criticizes Bruno's anti-aristotelianism, considering him an unrepentant atheist, and creating a combination that in time would become almost proverbial, identifies in the ontology of *De la causa, principio et uno* the roots of Spinoza's pantheism.

This alternation of positive and negative can also be found in the eighteenth century. The great

philosopher Leibniz, for example, did not have a high opinion of Bruno; while John Toland was a great admirer, especially appreciating the rigorously natural imprint of Bruno's philosophical reflection and the critique of revealed religions that follows, found in the pages of the *Spaccio de la bestia trionfante*. Bruno was held in some regard by historians of astronomy Johann Friedrich Weidler and Jean Sylvain Bailly, who discuss him in their writings, setting out the main points of his cosmology. Similarly, Bruno's name is frequently mentioned in impressive works of scholarship of the time: writers such as Jean-Pierre Niceron, Jacques Georges de Chauffepié, Johann Jacob Brucker, and David Clément reserve for Bruno plenty of space in their dictionaries or in their historiographic and bibliographic texts, acknowledging some merit, but also insisting on his mistakes (beginning with atheism) and underlining the analogy between his ideas and those professed by Spinoza. However, of the eighteenth century, we must especially recall two very important interpretations that contributed not a little to raising awareness about and appreciating Bruno's thought. The first is that of Diderot, who admired Bruno greatly and wrote an entry dedicated to him in the *Encyclopédie* (1765). The Enlightenment thinker summarizes the essential principles of Bruno's philosophy, and seeing it as a real anticipation of that of Spinoza and Leibniz makes Bruno the true founder of modern thought, the first to break free from the theoretical constraints of Aristotelian concepts (such a positive judgment must be counterbalanced, within the Enlightenment, by that of Voltaire, who in the *Lettre sur François Rabelais* of 1767 presents Bruno as a fool, who to defend his own ideas could not avoid death at the stake). The second interpretation is that of the German philosopher Jacobi, who in the appendix to the second edition of his work *Über die Lehre des Spinoza. Briefen an Herrn Moses Mendelssohn* (1789) translates, publishes, and comments on an extract from *De la causa*. According to Jacobi, philosophers of the likes of Gassendi, Descartes, and Leibniz also drew inspiration from Bruno; but, above all, Bruno would have been, along with Spinoza, the greatest exponent of an atheist pantheism which,

in spite of its contradictory aspects (especially, conferring freedom on the human spirit without recourse to faith), is also a crucial moment in the history of modern thought.

The nineteenth century began with another important interpretation of Bruno's philosophy, which moreover moved in the wake of that already provided by Jacobi. In 1802, Schelling published the philosophical dialogue *Bruno, oder über das göttliche und natürliche Prinzip der Dinge*, in which the idealist thinker, while expressing some differences compared to Bruno, sees him as a philosopher who was able to capture and illustrate in an exemplary manner various essential theoretical points, such as the fundamental unity of everything, the presence of life throughout all nature, the relationship between the finite and the infinite, and the substantial identity of opposites. Still within the context of German idealism, Hegel himself devoted considerable attention to Bruno's philosophy, reserving for it a prominent place in his *Vorlesungen über die Geschichte der Philosophie* (1836), and recognizing the deep bond that would unite it with that of Spinoza; however, he finally passed a judgment that was on the whole negative, finding Bruno's philosophy representative of a still-imperfect state, in its purely objective dimension, of the development of the universal spirit. But the nineteenth century was also the century of the first modern editions of Bruno's writings: that of his Italian works edited by Adolf Wagner (1830), that of the Latin works edited by August Friedrich Gfrörer (1836), the Italian works edited by Paul de Lagarde (1889), and especially the Italian national edition of Latin works (including the "magic works") edited by Francesco Fiorentino, Felice Tocco, Girolamo Vitelli, Vittorio Imbriani, and Carlo Maria Tallarigo, distinguished from all others for its great philological rigor (1879–91 = Bruno 1962). Nor can we forget, finally, that in the second half of the century several scholars who studied Bruno were active in Italy: Bertrando Spaventa considered him one of the leading philosophers of modernity – a precursor, in particular, of Spinoza – and as a true hero of freedom of thought, though he could never completely resolve the problem of the relationship

between God and nature; Francesco Fiorentino, while recognizing its greatness, criticizes his pantheism as a form of unfinished dialectic and he too connects his thought to that of Spinoza; Felice Tocco mainly studies Bruno's complex concept of religion, the relationship between Bruno's works and their ancient and modern sources, as well as the relationship between the set of Latin writings and the Italian writings.

In the twentieth century the thought of Bruno – now universally recognized as one of the greatest thinkers of the modern age – is at the center of a lengthy new period of study and research, on the one hand taking up and developing traditional exegetical grounds with a more pronounced historiographical sensitivity compared to the past; on the other hand leading to innovative and original interpretations, highlighting previously somewhat neglected aspects of Bruno's work, such as those related to magic and the art of memory. In this sense, one must recall the research of Frances Yates, who interpreted the works of Bruno by including them in the tradition of Hermeticism and proposing an interpretation of great originality; that of Paolo Rossi, whose exemplary pages on Bruno focused especially on the roles of magic and mnemonics in his works; and that of Giovanni Aquilecchia, who made fundamental contributions to Bruno studies in philological, exegetical, and documentary terms (among other things, in 1958 he edited an important reprint, revised and corrected, of the meritorious edition of Bruno's Italian dialogues prepared by Giovanni Gentile at the beginning of the century). This is a time that saw an intensification of scientific production in the years around 2000 (the date of the fourth centenary of the death of Bruno), which continues today – also due to the contribution of a younger generation of scholars – with the frequent publication of new editions and new monographs, testifying in the best possible way the great relevance and vitality of Bruno's thought.

Buchanan, George

Born: 1506, Killearn, Scotland

Died: 1582, Edinburgh, Scotland

David McOmish

School of Humanities, University of Glasgow,
Glasgow, Scotland, UK

Abstract

George Buchanan was a humanist writer and educationalist. His prolific literary and administrative activities exerted a significant influence upon intellectual culture in Scotland and Europe. He played a central role in the implementation of humanist educational reforms in France, Portugal, and Scotland. An accomplished Neo-Latin writer, he produced works in a remarkable variety of Neo-Latin genres and forms. Often addressing political and philosophical volatility across early-modern Europe, his works are pervasively informed by a stabilizing prescription of Stoic moral and natural philosophy.

[Buchananus, Georgius](#)

Biography

Buchanan was born in 1506 in Killearn, a Gaelic-speaking community (Erskine and Mason 2012; McFarlane 1981, 19) between the Campsie hills and the western highlands of Scotland.

After completing his early education in local schools, he moved east to St Andrews University, where he studied until 1525. He

left Scotland for Paris, where he gained a BA in 1527. He began his career in education at Paris at the Collège Sainte-Barbe, where he taught and latterly held an administrative role as the curator of the German Nation (McFarlane 1981, 23–25). For the following 10 years, he also tutored members of the Scottish nobility in Paris and Scotland (Buchanan 1598).

After a brief period of incarceration in 1538 for religious transgressions (Buchanan 1582, 14.45), he returned to formal education a year later at the Collège de Guyenne in Bordeaux, at the invitation of the principal André de Gouveia. At Bordeaux, he taught, among others, the French philosopher Michel de Montaigne. In 1547, Buchanan traveled to Coimbra in Portugal with many of his colleagues from Bordeaux, including André de Gouveia, Elie Vinet, and Buchanan's brother Patrick (Buchanan 1598). At Coimbra both Buchanan and Vinet befriended and worked with the Portuguese mathematician and educationalist Pedro Nunes (Desgraves 1977, 7). Buchanan's time at Coimbra was brought to an end when he was detained and interrogated by the inquisition in 1550 in relation to his confessional disposition (Aitken 1939).

Between Buchanan's eventual departure from Portugal in 1552 and 1556, he published his first collection of verse paraphrases of the biblical psalms (Green 2011, 24–5). Many of these poetic renderings highlight the influence that both astronomical conjecture and pedagogy (didactic tradition) had upon Buchanan's presentation of the universe's guiding divinity (especially Psalm 104). Buchanan had developed his interest in and understanding of natural philosophy during his period at Coimbra, where his colleagues Vinet and Nunes were refashioning Sacrobosco's *Sphaera* into a humanist educational tool (McFarlane 1981, 370) and intellectual response to the recent publication of *De Revolutionibus* by Copernicus. In 1555, Buchanan was appointed tutor to the son of the Count De Brissac, at which time he began working on his monumental didactic explication in verse of stoic moral and natural cosmology, *De Sphaera*, which he

would ultimately never finish (Naiden 1952). Buchanan returned to formal education again in 1566, acting as a reforming principal at the University of St Andrews (St Leonard's College) until 1570, at which time he earned his ultimate pedagogical reward when appointed tutor to the young King James VI of Scotland (McFarlane 1981, 224).

During his time at St Andrews, and then as tutor to the young king, Scotland experienced significant political turmoil. It was at this time that Buchanan produced two major works: the *De Iure Regni apud Scotos Dialogus*, a dialogue on good kingship, and *Rerum Scoticarum Historia*, a monumental history of Scotland. As with his earlier work *De Sphaera*, Buchanan manipulated his literary forms to present a stabilizing philosophical message heavily influenced by stoic moral and natural philosophy (Mason 1982). The mid-sixteenth-century natural philosophy that Buchanan advocated was eventually swept aside by the advances of the Scientific Revolution. However, his reputation lived on in the literary and educational value of his forms and genres and their continued use in political (Mason 1982; Mason and Smith 2004; McGinnis and Williamson 1995; Smeesters 2013), scientific (King 1616; Ruddiman 1715), and religious discourse (Sharrat and Walsh 1983; Green 2011) in Scotland and Europe. He died in Edinburgh in 1582.

Budé, Guillaume

Born: 26 January 1468, Paris

Died: 22 August 1540, Paris

Luigi-Alberto Sanchi

CNRS, Institut d'histoire du droit, Paris, France

Abstract

Guillaume Budé's manifold humanistic production represents a puzzling challenge in today's specialized scholarship and makes it difficult to encompass all its aspects. A higher civil servant at the French Court, Budé never held teaching appointments, but showed in his books how French university teaching should be renewed through the study of the humanities. He is considered to have been the founder of Collège de France, whose first lectures were given in 1530. Budé became King Francis I's counsellor and thus helped Parisian humanism to develop. His production was wide ranging, including a philological study of Justinian's Digest ushering in the *Mos Gallicus iuris docendi* (a new historical approach to Roman law), an outstanding monograph on economics in Antiquity, moral essays, and a large Greek prose thesaurus anticipating that of Henri Estienne. Budé also published some translations from Greek and a selection of his own letters, written in Greek and Latin. His extensive knowledge was based on a large personal library, which is still known only partially. From a religious point of view, Budé defended in his *De Transitu hellenismi ad Christianismum* a sort of Gallican version of Catholicism against, on the one hand, the growing French Lutheran movement and, on the other, the conservative Sorbonne theologians hostile to the humanistic renewal of the University of Paris.

Alternate Names

Budaeus, Guillielmus

Biography

Born in Paris on 26 January 1468, Guillaume Budé came from that *milieu* of higher civil servants that would eventually become the French *noblesse de robe* or “*robin*” establishment (Delaruelle 1907; McNeill 1975; Gadoffre 1997; Maillard 1999). His father, Jean, was an educated man, a jurist appointed as a royal secretary at the King's court; the family of his mother, Catherine Le Picart, was linked to the powerful Poncher family. The fourth of 15 siblings, Guillaume received a primary school education in Paris and then studied law in Orleans, 1483–1486. Some three years later, he went far beyond his father's love for books and started a period of intensive and lonesome studies, at first on Roman law, then on Antiquity as a whole; Jean tried to discourage his son by getting him appointed at the royal court as a secretary, so that Guillaume could start a career as a court jurist. Instead, Guillaume used any spare time he had to get in touch with some Italian humanists who came to Paris and with the humanistic circle of Jacques Lefèvre d'Étaples, at that time a successful professor in the Faculty of Arts in Paris, after his journey to Italy.

Probably in 1494, Budé was taught basic Ancient Greek by Georgios Hermonymos, a scribe and professor in Paris. As King Charles VIII returned from war in Italy with the famous Greek scholar and diplomat Janos Lascaris, Budé was introduced to him, became his friend and obtained from him some advanced Greek lessons which fostered his learning. Thanks to that and to an intensive training, Budé was now able to read – in addition to ancient and medieval Latin literature – several major Greek authors he could find either in manuscripts (Hermonymos copied a few for him) or in the first *incunabula* printed in Italy. In 1501 and 1505, he also had the opportunity to travel to Italy with the King's court, visited Venice, Florence, and Rome and met a few Italian scholars, including Poliziano's disciple Pietro Ricci, who showed Budé, in Florence, some of his master's notebooks.

At this time, Budé started to publish his own productions. A few short translations from

Plutarch, Ps.-Plutarch and Basil of Caesarea (Budé 1505, 1506) marked him as the first Frenchman to translate from Ancient Greek into Latin in modern times. He soon published his first monograph, a vast and controversial inquiry on Roman laws and institutions grounded on an innovative historical and philological study of Justinian's Digest: *Annotationes in XXIV Pandectarum libros* (Budé 1508; see also Budé 1544). Yet Budé did not acquire international fame before his 1515 masterpiece *De Asse et partibus eius libri V*, which solved some fundamental mysteries in understanding Antiquity's economic system and was read by key scholars of the day, like Erasmus and Thomas More (Budé 2018).

Under King Louis XII, Budé kept away from the court, dominated by a group that was indifferent or hostile to the humanistic renewal Budé and his friends wanted to implement in France following the example of Renaissance Italy. However, when in 1515 a new King, the young Francis I, ascended the throne. Budé gradually obtained the King's attention and support. Thus began a prestigious career at his court, where he became counsellor of the King, then *maître des requêtes*, a sort of mayor of Paris, and *maître de la librairie du roi*, the King's personal librarian. A first step on this path was a French manuscript work (Budé [1519]) addressed to Francis and containing various counsels on how to be a good monarch collected from Plutarch, from the Bible and from ancient historians and philosophers (The book is known under the title of *Institution du prince* and was printed after Budé's death with some additions: Budé 1547). Later on, a French summary of *De Asse* (Budé 1522) enjoyed local success and would be republished many times. Francis I came to appear in some of Budé's fictional dialogues; two of his works were dedicated to him.

On the other hand, Budé addressed the humanist public again in 1520 with the first edition of his Greek and Latin *Epistles*, a collection of letters between Budé's and various French, Italian, and other European scholars, whose contents indicated international acknowledgement for *De Asse* (Budé 1531; Gueudet 2004). He wrote a philosophical essay on the concept of chance (Budé 1520; Lecoindre 2006) and issued three

other editions of *De Asse*: in Paris in 1516, in Venice, at the press of the heirs of Aldo Manuzio, in 1522, and then in Paris in 1524, again with his friend the printer Josse Bade.

By this time, Budé and his Parisian humanist friends had reason to believe that the struggle for a humanist renewal in France would be successful. But the King's captivity in Spain (1525–1526) as well as the quick progression of Lutheranism in France and especially among Parisian humanists changed the situation.

French humanists came more often and more openly under attack by the Sorbonne theologians as they were suspected of being Lutheran. The danger was such that some of them had to be granted royal protection, often due to Budé's interventions. He also launched another ambitious research project on the lexicography of Greek prose, based on thousands of quotations, which would lead to the publication of the *Commentarii linguae Graecae* (Budé 1529) and to the enrichment of earlier books through new editions: in 1526, he both issued an enlarged edition of *Annotationes in Pandectas* and a new translation of Philo's and Ps.-Aristoteles treatises *De mundo* (Budé 1526); in 1527, a fifth, greatly revised edition of *De Asse* was published.

The *Commentarii* enjoyed immediate success and had three international editions in 1530. In order to protect French humanists, Budé opened his work with a remarkable Greek preface to Francis I, boldly asking him to found and sponsor a wealthy Royal College meant to disseminate the knowledge of all sciences through the study of ancient tongues, in particular Greek and Hebrew, and to create a new French educated élite rivalling that in Italy. The preface was read to King Francis in a French manuscript version. Printed in September 1529, the masterpiece was followed, at the beginning of 1530, by the creation of the first two chairs of "Lecteurs royaux" (royal professors) in Greek and Hebrew. This was later recognized as the starting point of Collège des Lecteurs royaux (now known as the Collège de France).

Budé's last ten years of life – he died in Paris on 22 August 1540 – were equally restless. He prepared new editions of his *Epistles*, of the

Annotationes in Pandectas (1535), of *De Asse* (1532 and 1541, posthumous) as well as of the *Commentarii*, fully reworked and enriched by one third (1548). But he had to keep battling, together with other important French humanists like François Rabelais, Étienne Dolet, and others, because their enemies, mainly the conservative Sorbonne theologians, would not stop attacking humanist teachings and books: a trial against the Royal lecturers was launched no later than 1533. Budé gave active support to his friends at the King's court, also by writing theoretical treatises on the importance of philology and the humanities, *De Studio recte ac commode instituendo* and *De Philologia*, a dialogue with Francis I (Budé 1532a, b).

The King's attitude suddenly became much less favourable after the Affaire des Placards, a radical Protestant provocation against the "papal Mass" which occurred in October 1534; this event unleashed a general repression including, among others, a ban on printing books. Probably worried about the survival of French humanism, Budé felt the need to publish his thoughts about scholarship and Christian religion; he argued that the latter needs to be subject to the former in a scholar's life. *De Transitu hellenismi ad christianismum* ("The Transition from Hellenism to Christianity") was printed in 1535 with a vibrant preface to the King, where Budé attempts to make a distinction between the "good" humanists asking for peaceful discussions and the "bad" radical reformers aiming at subverting the society (Budé 1535; de La Garanderie 1995). The following year, John Calvin opposed this point of view in his own preface, addressed to the King, of the first edition of his *Institutes of the Christian religion* (Bohatec 1950).

Heritage and Rupture with the Tradition

Like Erasmus, Budé aimed at becoming the heir of the best Italian humanist tradition, represented by Lorenzo Valla and Angelo Poliziano (Budé 1556; Sandy 2003). For him, the meaning of humanism is essentially the possibility to study thoroughly Antiquity's complex universe in order

to reform modern nations. His first approach is that of a jurist: after Valla and Poliziano, he understood the need for a better grasp of Roman law, taking Justinian's Digest as an exceptional monument of ancient literature that reveals several aspects of Greek and Roman civilization. So Budé's *Annotationes* (Budé 1508) harshly criticized the medieval tradition of Digest interpretation to introduce a new, historical way to study it (Kelley 1970). With *De Asse* (Budé 1515; Sanchi 2012), he tried to equal Italian humanism in its best results – Poliziano's *Miscellaneorum Centuria prima* (1489) and Ermolao Barbaro's *Castigationes Pliniana* (1492–1493) – by offering emendations to Pliny's difficult texts and reconstructing features such as counting and monetary systems, variations of prices and economic value in Antiquity, which his predecessors did not fully understand. Budé may also be linked to the late Byzantine tradition, thanks to his friendship with Janos Lascaris and to his relations with Georgios Hermonymos; he thus came to have a deep knowledge of elevated byzantine Greek, derived directly from Greek speakers and writers.

Innovative and Original Aspects

Most of Budé's innovations are to be found in his scholarly production. Together with Andrea Alciato and before Jacques Cujas, Budé is considered as the founder of the *Mos Gallicus iuris docendi*, the new historical school of Roman law interpretation opposed to the medieval, and systematic, *Mos Italicus*. His research on Roman law included a large-scale comparison of the institutions in Greece, in Rome, and in France; in the footsteps of Poliziano, but in a much more intensive way, he focused on the study of rare or difficult words and on the emendation of textual errors that had occurred during medieval transmission and interpretation.

If the *Annotationes in Pandectas* still has the structure of a commentary, *De Asse* is one of the first modern scientific monographs, composed like an essay and focused on philological problem solving, mostly on Pliny and other difficult texts and on reconstructing ancient economic systems.

It displays a modern approach, including a study of primary sources like Hellenistic and Roman coins. Moreover, Budé explains to his readers the development of his research in minute detail, offering a sort of philological detective story about his discoveries and the difficulties he had to overcome. This feature makes *De Asse* a unique masterpiece. More generally, Budé's method is described in terms of "philological imagination" (Logan 2003).

Budé's third philological large work, the *Commentarii linguae Graecae*, includes a collection of some 20,000 quotations chosen to illustrate several semantic *nuances* in Greek vocabulary, mainly taken from the prose style of a wide range of authors, from Homer to Ps.-Dionysius (Sanchi 2006). The first Greek thesaurus produced in the West, the *Commentarii* was the standard work in this field until Henri Estienne's 1572 *Thesaurus linguae Graecae*.

Impact and Legacy

Budé's work enjoyed a broad influence until the end of the seventeenth century. During his lifetime, his major works were constantly republished in France and abroad and enjoyed a large success in the scholarly world of humanists, even though Budé's prose was seen as harsh and difficult (Wallace 2009; de La Garanderie 2010). After his death, he became the point of reference for the new generation of French scholars, including Cujas, Lambin, and Casaubon.

His permanent struggle to set French humanism on a solid footing under royal protection reached its goal with the foundation of the first chairs of "Lecteurs royaux," an institution given more permanence at the beginning of the seventeenth century. This achievement derived from a preoccupation reflected in almost all of his writings, since Budé was wont to insert even in his philological works some long digressions on French national issues, mostly about the need to develop high-level education in the élites and to better organize the kingdom. In the area of politics, Budé authored a precocious reflection on the power of monarchs ("*Princeps legibus solutus*" in

Annotationes, but also in *Institution du Prince*) which gave rise to an absolutist point of view, if not to a complete theory of absolutism.

Budé's sincere Christian faith led him to publish his thoughts on religious matters. He boldly criticized the established Church, calling for a deep reformation of it, but soon began to oppose the Lutheran and radical Reformation movements, which he mainly saw as the roots of public disorder (yet Budé and his sons probably knew John Calvin, born 1509, since the early 1530s; and in 1549 Budé's widow, Roberte Le Lieur, joined Calvin in Geneva with a majority of their family). If many reflections about these religious issues are already within his scholarly works as digressions, a full development of them is given in *De Transitu*, which has received recent editions with French translation (see at Budé 1535).

Even though Budé is far less renowned today than his contemporary Erasmus, his works continue to be republished and several aspects of his scholarship and intellectual positions are being investigated anew.

Abstract

Francesco Buonamici was professor of Philosophy at the University of Pisa for almost 40 years. His most important work is the treatise *On Motion (De motu)*, a huge volume of 1011 pages, which covers the whole range of aspects of Aristotle's concept of motion. Buonamici supplies a careful survey of the topic, with an extended discussion of the Aristotelian views as well as of the opinions of a number of ancient and early modern authors who played a major (sometimes innovative) role in philosophical debate of the Sixteenth century. His *De motu* (Buonamici 1591) was read and cited by Galileo, who often used Buonamici's bulky treatise as a source for mastering Aristotelian natural philosophy.

Biography

Buonamici was born in 1533, very likely in Florence, where his father served as a notary. He studied philosophy and medicine at the University of Pisa, and he was friend and disciple of two eminent philologists of the age, Pier Vettori (1499–1585) and Ciriaco Strozzi (1504–1565), under whose guidance he gained an excellent competence in reading Greek texts. In 1565, Buonamici became “assistant professor” (*extraordinarius*) of Philosophy at the University of Pisa. Then, in 1571, he became “full professor” (*ordinarius*) of Natural Philosophy, with the duty of teaching Aristotle’s *De caelo*, *De Anima*, and *Physica* in 3-year cycles. He stayed at the University of Pisa all his life, although, after 1598, he was asked to succeed Francesco Piccolomini on the chair of Natural Philosophy in Padua. He died in his holding of Orticaia, a hamlet in the municipality of Dicomano (about 25 miles away from Florence), the 23 September 1603.

Innovative and Original Aspects

Before his death, Buonamici published a book on nourishment and embryology, *De alimento*, printed in Florence in 1603 (Buonamici 1603). The book deals with various topics related to the action of food on human body, and it also discusses the making and development of fetus.

Yet, Buonamici’s major work remains the *De motu*, completed in 1587 but issued in 1591. The treatise is divided in ten books. In the first one, Buonamici establishes his method, giving the rules to be followed in natural research. The second book provides the definition of motion, touching the problems of its continuity and its relationship with quiet. The third and the fourth books discuss the motion of the elements, mainly surveying the role of the form in producing it, with interesting digressions on the motion in the void and on acceleration in free fall. In the fifth book, Buonamici, after discussing Copernican cosmology, examines the concepts of “heaviness” (*gravitas*) and “lightness” (*levitas*), expounding his views on the fall of heavy bodies. The next books till the eighth are devoted to aspects of

motus different from the local motion, such as the substantial transformation, the generation, the increasing and decreasing, the condensation and rarefaction, the alteration, the intension, and remission of qualities. Then, the last two books deal with the celestial circulation and its movers, the matter of heavens, the eternity and perfection of the world, and finally with God, who Buonamici, echoing Epicurus, outlines as an entity which eternally contemplates itself, without any worry about human events.

Impact and Legacy

Buonamici was a firm advocate of Aristotelian philosophy. Notwithstanding, his thought was permeated of classical influences and willing to take into account the opinions of modern authors. His philosophical approach was purely naturalistic, since it did not take into account occult or supernatural explanations.

Some of the main topics treated in Buonamici’s *De motu* resonate also in the pages of Galileo’s early writings on dynamics. In particular, we can find implicit references to Buonamici’s work in the discussion of the questions of falling bodies and of Archimedean extrusion. Hence, Buonamici’s treatise can be considered as a valuable source for the knowledge of Renaissance natural philosophy as well as of the intellectual context in which Galileo matured his early theories on motion.

Burana, Giovanni Francesco

Born: 1475/1480, Verona

Died: 1523 ca., Venice

Coralba Colomba

Department of Humanities, Università del Salento, Lecce, Italy

Abstract

Giovanni Francesco Burana, a philosopher and a doctor in medicine, is well known for his translations of Prior and Posterior Analytics and Averroes commentaries, which have been

republished many times in the Renaissance, starting from the Giunta edition in 1552. At a very young age he translated music treatises (Aristides Quintilianus, Manuel Bryennius) for Franchinus Gaffurius in Milan. Then he studied and taught logic in Padua, as a pupil of Gerolamo Bagolino, but he left early the teaching in order to study and practice medicine, probably in Verona. However, he continued to study logic, bequeathing translations and commentaries on Aristotelian texts.

Biography

Giovanni Francesco Burana was born in Verona sometime in the last decades of the fifteenth century between 1475 and 1480. We do not know much about his life. Still young, even before receiving his doctorate, he translated some Greek texts on the theory of music for the musician Franchinus Gaffurius, maestro di cappella at the Duomo of Milan (Stabile 1972; Gallo 1963). While he was a guest at Gaffurius's house, Burana translated *De musica* by Aristides Quintilianus, and probably in the same year, also from Greek, the *Brevis musicae tractatus*, in the codex CCXL (201) held at the Capitular Library of Verona. The same codex contains the translation of two books of the *Harmonica* by Manuel Bryennius, dated back to 15 April 1494. Burana translated the Bryennius treatise a second time in 1497 at the request of Gaffurius. This second translation is preserved in the codex XXVIII A 8 at the Biblioteca comunale in Lodi (Gallo 1963; Stabile 1972).

We cannot know if Burana was residing in Milan from 1494 to 1497. Possibly he studied languages and music there (Lohr 1988). Yet, it is certain that he moved to Padua where at the Studium he attended lessons on logic by Gerolamo Bagolino, slightly older than him, and they became friends. In Padua, he received his doctorate *in artibus* on 24 May 1500, supervised by the logician Gerolamo Suriano (Facciolati 1757; Stabile 1972; Lohr 1988), and the following year was there to teach logic (Facciolati 1757; Mazzuchelli 1758; Sanuto 1880; Nardi 1958; Lohr 1988). Between 1501 and 1502 we find him among the examiners for some degrees,

such as those in medicine for Bagolino and Gerolamo Fracastoro. He soon left the teaching of logic in order to study medicine, as both the well-known Nicoletto Vernia and his friend Bagolino did before him. He subsequently devoted himself to his work as a doctor, probably in Verona (Stabile 1972; Lohr 1988).

After he left his chair in logic we do not know much about Burana. He did not abandon completely his studies and, in his free time when he did not practice his work as a doctor, he started to reorganize his teaching material and to write an extensive commentary on Aristotle's Prior Analytics in order to publish it. But, unfortunately, he died in Venice working as a doctor during a plague epidemic around 1523 (Stabile 1972).

Impact and Legacy

Before dying, Burana disposed by his Will that his heirs were to publish his work after a careful revision of the texts which he had been unable to complete. The task to edit the texts and later publish them was given to Gerolamo Bagolino. So, on 23 July 1523, the Great Council of Venice allowed Bagolino to print "un'opera sora i priori di Aristotile composta per Zuan Francesco Burana" (Sanuto 1892; Stabile 1972). The work was published for the first time in March 1524 by the heirs of Octavianus Scotus. Its title was *Burana in libros priorum resolutorium* (Lohr 1988), and it contained the translation from Greek of the *Analytica priora*, together with a commentary by Burana and a translation from Hebrew of the *Expositio media* on the Prior Analytics and Averroes' *Compendium in librum priorum Aristotelis*. It contains also some *Annotationes* by Bagolino on Burana's commentary (Stabile 1972).

Burana's fame and name are linked to this posthumous publication. The work was reprinted in Venice in 1536, without the translations of Averroes, with the title of *Ioannis Francisci Burane Veronensis Interpretatio fidissima necnon exactissima expositio in priores Aristotelis resolutorios nuper accuratius recognita*.

Following the spread of Paduan Aristotelianism in France, it was printed in Paris by Wechel in 1539 (*Aristotelis Priora analytica seu resolutoria a Io. Francisco Burana in Latinum sermonem versa, commentariis... illustrata*). The work then had two other Venetian editions in 1545 and in 1550, with Hieronymus Scotus (*Aristotelis Priora analytica seu resolutoria a Io. Francisco Burana Veronensi in Latinum sermonem versa*) (Stabile 1972; Lohr 1988).

During these years, the Giunta publishers had begun a big editorial project of translating Aristotle's complete works, a project coordinated by Giovambattista Bagolino (Gerolamo's son), and, after he died, by Marco degli Oddi. The first volume of the *Aristotelis Stagiritae omnia quae extant opera* (Venetiis, apud Iuntas 1552) gathers Burana's translations of the Prior and Posterior Analytics, together with the related Averroes' commentaries. Bagolino, in fact, had Burana's manuscript material, and the publishers themselves stated that they had a hand in revising both the *Priora* and Averroes middle commentary (Bagolino), and the *Posteriora* and Averroes' long and middle commentaries (Oddi) (Stabile 1972; Schmitt 1979; Burnett 2013).

As regards the *Analytica priora*, Burana's translation (already published in 1524) is a revision of the Boethius's translation, modified and corrected on the basis of a comparison with the Greek text (Minio-Paluello 1962; Stabile 1972). The Giunta edition of the *Posteriora* contains two versions: the first one, although ascribed to Burana, is James of Venice's Greek-Latin version, while the second is the Hebrew-Latin one which Burana took from Kalonymus ben Kalonymus's version of the Averroes long commentary (Minio-Paluello 1954; Stabile 1972).

More complex is the story of Burana's translations of Averroes's commentaries. The Giunta edition contains the translation of the *Expositio media* on *Analytica priora* (already released in 1524) and, for the first time, the translations of the *Commentarium magnum* and of the *Expositio media* on the *Analytica posteriora* (remembering that Burana translated the *Commentarium magnum* based on Kalonymus ben Kalonymus's Hebrew version, while the translation of the

Expositio derives from Jacob Anatoli's Hebrew version) (Stabile 1972).

The *Expositio media* to the *Priora* – as mentioned above – had been revised by Bagolino's son, Giovambattista, and the two commentaries to the *Posteriora* were collated again by Oddi using Burana's unpublished manuscript. Oddi underlined that Burana's version of the *Commentarium magnum* was “manca ac depravata,” thus he decided to choose as a source text Burana's version, editing it and completing it with the translations made by Jacob Mantino and Abram de Balmes. The three translations would be published separately, and with synopses, only in the Giunta edition of the *Opera aristotelici* edited by Bernardino Tomitano (I, 2, Venetiis 1562) (Stabile 1972; Schmitt 1979; Burnett 2013).

Under Burana's name, therefore, is hidden so much activity of editing, correcting and adding as to make it impossible to find his original work with certainty (particularly as far as the Averroes commentaries is concerned). Criticism has been raised concerning Burana's real skills in translating the Hebrew texts “car on ne peut guère supposer qu'un chrétien à cette époque ait pu savoir assez bien l'hébreu rabbinique pour traduire des tetes aussi difficiles” (Renan 1866). However, these doubts were removed by Gerolamo Bagolino's authoritative testimony (Maffei 1731), and by the fact that Burana was a student of Gerolamo Suriano, a publisher and an expert on Arabic-Hebrew texts (Stabile 1972). Nonetheless, we cannot exclude the possibility that Burana used Hebrew translations which at that time circulated among Venetian circles. This could explain the similarities of the passages of the translation of Averroes's commentary to the *Analytics* made by Elia del Medigo to Burana's text (Kieszkowski 1964; Stabile 1972).

Burana's translations were well received and often reedited and reworked. His version of the *Analytica priora* was included in many commentaries to Aristotle and in subsequent editions of his work, and was largely circulated due more to the Venetian publishers' reputation than to its real value. It was used by Bernardo Feliciano (*Alexandri Aphrodisiensis in Priora resolutoria*, Venetiis 1542); for Leo Magentino's commentary,

translated by Giovambattista Rasario (*Magentini in Priora Aristotelis resolutorios explanatio*, Venetiis 1544); Lucillo Filalteo (*Philoponi in libros Priorum resolutiorum*, Venetiis 1544); and by the physician from Genoa, Alessandro Giustiniani Chio (*Philoponi in duos Priora analyticos... commentarii*, Venetiis 1560). It is also worth mentioning the following editions: Venetiis, apud H. Scotum 1557; apud Iuntas 1562, 1574; ad signum Seminantis 1572; apud Bindonium 1576; Lugduni, apud Iuntas 1560, 1561, 1579; apud Michaellem 1578; apud Cardonum 1618; Genavae-Lugduni, I. Berjon 1580; Coloniae Agrippinae-Basileae, Stoecker 1608; Romae, A. Bernabò 1668, an edition with a commentary by Silvestro Mauro, republished in Paris, with Lethielleux in 1885 (Stabile 1972).

Abstract

Jacob Burckhardt was an art and cultural historian, renowned for his historiographical method known as *Kulturgeschichte*. In the analysis of a historic moment, this method focuses on the moment's inner aspects, such as the contemporaneous art and literature, the religious and moral habits, and the economical and social developments. Burckhardt was the author of the notable *Die Cultur der Renaissance in Italien* (1860; *The Civilisation of the Renaissance in Italy*), in which he declared that modernity was born in Italy in the fifteenth century. This work has long remained – and it

still remains, even if outdated in many aspects – a classic of the critical literature on the Renaissance and an excellent example of cultural historical studies.

Biography and Works

Father of a new historiographical method named *Kulturgeschichte* and author of the notorious book *Die Cultur der Renaissance in Italien* (1860; see Burckhardt 1955–1959, vol. 3 or Burckhardt 2000–2014, vol. 4), Burckhardt was born in Basel in a protestant evangelical family. The father was a clergyman of the Reformed Church in Basel, and he prompted the young Burckhardt to undertake theological studies. Thus, from 1837 to 1839 Burckhardt studied at the University of Basel, where the theologians Karl Rudolf Hagenbach and Wilhelm De Wette taught. In particular, De Wette made use of the new-fangled historical criticism in the exegesis of the Bible, an approach which left a deep mark in Burckhardt's soul, engendering in him a substantial crisis of faith. In the end, the historical biblical criticism allowed Burckhardt to distance himself from the pious community of Basel. However, in Basel he had also the opportunity to focus on humanities, especially on ancient Greek, which drew him near to philological and historical research. For these reasons, he abandoned his studies in theology, and he went to Berlin, where he attended the lessons of the philologist August Boeckh and of the historians Johann Gustav Droysen and Leopold von Ranke at the *Friedrich-Wilhelms-Universität*. Burckhardt recognized in Ranke one of his mentors, sharing with him a criticism of Hegel's philosophy of history, but he ended up developing a different historical approach. Ranke, one of the most eminent proponents of the political history school, endorsed the leading role of nations and states as individual

political entities able to preserve order and cohesion. Instead, Burckhardt steered the analysis of history towards the inward conditions of society, highlighting the cultural transformations, which had caused the evolution of people and nations. Their differences notwithstanding, Burckhardt owe Ranke at least three aspects of his *Kulturgeschichte*: first, the judgment that individuality is the foundation of every historical event; secondly, the relevance of the contemporaneous sources; and thirdly, the adoption of an all-embracing perspective. In 1841 Burckhardt headed towards Bonn, where he spent a summer term, joining the Gottfried Kinkel's literary group, the *Maikäferbund*. Thanks to Kinkel's enquiry on paganism and the influence of his friend and cultural historian Heinrich Schreiber, Burckhardt wrote *Die Zeit Constantin's des Grossen* (1853; Burckhardt 1955–1959, vol. 1 or Burckhardt 2000–2014, vol. 1), in which he dealt with the troubled passage from the classical world to the Christian orthodoxy. Between 1843 and 1845, Burckhardt was granted a PhD degree from the University of Basel and was appointed first *Privatdozent* and later *ausserordentlicher Professor* in history. In addition, 1842 was the year of his first publication, *Die Kunstwerke der belgischen Städte*, dedicated to his art history teacher Franz Kugler, who was also an illustrious member of the Prussian ministry of culture. The relevance Kugler attributed to the historical context in which the development of art should have been included and to the strong bond between art and society represent the roots of Burckhardt's cultural history. Following the long-lasting friendship between him and Kugler and a first "*Italienische Reise*" in 1847–1848, the Swiss historian edited a second art book, *Der Cicerone* (see Burckhardt 1955–1959, vols. 9–10 or Burckhardt 2000–2014, vols. 2–3), in 1855 in which not only he geographically explored the Italian art but he also judged the ruins of the ancient Roman art as the result of the overwhelming Christian paradigm over the pagan world, blaming Christianity for the loss of the principle of individuality and of any aesthetic pursuit. In the same year, he was offered the chair of art history at the *Eidgenössisches*

Polytechnikum in Zurich, but in 1858 he was obliged to return to Basel where he taught history and, from 1874 until his retirement in 1893, history of art as well.

The Civilization of the Renaissance in Italy

In 1860 Burckhardt edited his masterpiece, *Die Cultur der Renaissance in Italien* (see Burckhardt 1955–1959, vol. 3 or Burckhardt 2000–2014, vol.4), an emblematic example of a cultural history book. Divided into six parts, it reports contemporaneous records, and it dwells not only on events but also on concepts, customs, and personalities. The *Versuch*, as Burckhardt calls his work, appears as a sort of painting, made of words, of the Renaissance myth. The image of Italy as the cradle of modernity and as the cultural and social milieu where the bonds to progress first failed, breaking with the medieval *Weltanschauung*, is upheld by Burckhardt through three main issues: the awakening of the ancient Greek-Latin spirit in Italian minds, the new awareness of the individuality of both man and state, and the discovery of the exterior world. Even if Burckhardt gives special attention to art, literature, and to the evolution of ideas, he also analyzes the political framework in which the Renaissance cultural transformation could have developed. However, his outlook on the Renaissance, on those switching forces that he considered dynamic, could appear fixed and static. Anyway, Burckhardt always preferred vital historical periods, during which entire populations experienced dramatic turning points, were spectators of the collapse of a previous world and bearers of a new culture. This appears clear in many of his early historical works, especially in 1853 *Die Zeit Constantin's des Grossen* (Burckhardt 1955–1959, vol. 1 or Burckhardt 2000–2014, vol. 1), a sort of antecedent of his Renaissance book, and in his university essay on Conrad of Hochstadt (see Burckhardt 2000–2014, vol. 8).

Impact and Legacy

Burckhardt's *Weltschmerz* and his contemplative historical view, his Archimedean point, were in

dissonance with the Comtean positive attitude on history or with Marxist, Neo-Hegelian, and Nietzschean historical paradigms, which focused on the concept of action. Nonetheless, Burckhardt was admired by Nietzsche, with whom he partakes of a late Schopenhauerian anti-Hegelianism and a general criticism of the leveling of democratic tendencies. His notoriety extended to nearly 40 years after his death, when Karl Löwith wrote a well-known essay about him. *The Civilization of the Renaissance in Italy* has been one of the most important and influential perspectives on the Renaissance for years, even if many aspects of it were already criticized at the beginning of the twentieth century, such as the stressed hiatus between the Middle Ages and the Renaissance, denied by Burckhardt's *Kulturgeschichte* spiritual heir, Johan Huizinga. However, we should remember that Burckhardt did not deny the importance of the Middle Ages, considering that he studied the German medieval epoch, stressing, for example, the creative spirit enlivening in the thirteenth century Cologne Cathedral (see Burckhardt 2000–2014, vol. 8).

Abstract

Burgersdijk's reputation in the seventeenth century rested on his well-ordered manuals dealing with all parts of philosophy. They adapted the *Corpus Aristotelicum* to the standards of humanist method. Burgersdijk's so-called neo-Aristotelianism is related to the Contra-Remonstrant movement in the Dutch Reformed Church, which triumphed at the Synod of Dordt (1619) and at Leiden University caused the dismissal or suspension of all philosophy professors with Arminian sympathies, such as Caspar Barlaeus and Gilbertus Jacchaeus, and a reform of philosophy teaching in the Dutch Republic, which had to be in harmony with the newly established reformed orthodoxy. In accordance with the 1625 School Order of the States of Holland, his textbooks were aimed at creating uniformity in the pre-university curriculum. His logical writings in particular remained in use at the Latin schools till nearly the end of the seventeenth century. Although abhorred by students, these manuals lingered in the curriculum of the British universities well into the eighteenth century. Due to the influence of both the manual of metaphysics and of logic on the early works of Spinoza in particular, Burgersdijk and his pupil and successor at Leiden University Adriaan Heereboord play a minor part in Spinoza research.

Biography

Burgersdijk, a farmer's son, was born in 1590 at De Lier in the Delfland region. The family name derived from a hamlet in the same region. According to his first biographer, Johannes Meursius in *Athenae Batavae*, Burgersdijk's father had some knowledge of Latin. Between 1606 and 1610 Burgersdijk attended the Latin school at Amersfoort and the Delft Gymnasium, where besides the classical languages, he learned logic and rhetoric. In 1610 he went to Leiden University in order to study theology. He attended the lectures of Franciscus Gomarus and Gisbertus Voetius and unwaveringly adhered to the Contra-Remonstrant faction. However, in that centre of humanist learning, Burgersdijk received a complete humanist formation, attending lectures on Latin, Greek, Roman history, and rhetoric. Moreover, he attended private lectures on practical logic and the art of disputation given by Voetius, at that time the vice-principal of the Staten College, a boarding school for students of theology established by the States of Holland. In 1614 Burgersdijk left Leiden in order to make a grand tour. He stayed at the Protestant Academy of Saumur, where he continued his theological studies with Gomarus, who in 1611 had left Leiden because of the ascendancy of the Remonstrant party in the Reformed Church. In 1615 he was appointed professor of philosophy. Due to his "deep affection toward philosophy" and his progress in that discipline, according to Meursius, the governors "deemed him fit to become master in the liberal arts and to obtain a doctorate in philosophy." Burgersdijk took this degree on 29 March 1620, only 2 days before he delivered his inaugural address on the use of logic in one of the vacancies caused by the purges of the universities after the Synod of Dordt. In November 1620 ethics was added to Burgersdijk's teaching assignment. In 1623 he completed his theological education by defending a disputation entitled "The Clarity of the Bible and Its Interpretation."

In 1621 he married a mayor's daughter. After 2 years, his son Pieter was born, who later studied law and was to become an important civil servant.

The recommendations of the Synod of Dordt included the call for a reform of the Latin schools. In 1625 new regulations were promulgated. In the final year, some ethics, physics, and geography would be taught and Burgersdijk was asked to raise the medieval “barbaric” Latin of Johannes de Sacrobosco’s *De sphaera* to humanist standards by making “astronomy” perspicuous and easy to understand. This schoolbook aimed at making the pupils familiar with the “first principles” of the subject, which were to be dealt with more fully at the university, as is observed in the introduction of the compendium.

In 1628 Burgersdijk exchanged moral philosophy for physics, but well before that date he lectured on physics. In 1624 a first series of fifteen disputations dealing with the Aristotelian corpus of natural philosophy was held, and in 1627 the next series was organized. Although his funeral orator, Petrus Cunaeus in his *Oratio habita in funere Franco Burgersdicii*, recorded that several of the deceased’s friends were amazed by this step, for “moral philosophy is the most excellent part of philosophy,” he noted the humanist ambition of Burgersdijk “to uncover the truth hidden in nature.” He therefore made the Aristotelian philosophy taught “by public authority” more perspicuous by clearing away “its scholastic obscurities.” In 1629 and 1630, Burgersdijk served as *Rector Magnificus*, and he was in this capacity when Descartes matriculated on 27 June 1630 as student of mathematics. During his rectorate, he helped to formulate new rules for the teaching of philosophy at the Staten College, which included the teaching of metaphysics. In 1634 Burgersdijk was elected Rector for the third time. Eleven days after the end of his office, he died, on 19 February 1635. He was buried in the choir of the Leiden Pieterskerk.

Notwithstanding his theological education, Burgersdijk’s teaching contributed to raising the status of philosophy at the Dutch universities. Through his manuals, he transformed philosophy into a discipline independent of theology and philology. In the early disputation *Utrum quod est verum in theologia possit esse falsum in philosophia*, he had the inalienable rights of

philosophy with respect to theology defended and adopted Aquinas’s view of the relationship between the disciplines by observing that both sciences deal with the same object. Its final conclusion is neat: Although theological dogma may exceed the limits of human reason, philosophy may be free from error. That is why the pagan Aristotle was the greatest philosopher. So Burgersdijk fully acknowledged the authority of Iberian neo-Scholasticism and of other Roman Catholic philosophers. Due to Burgersdijk’s teaching, the confessional neutrality of philosophy was generally taken for granted in the Dutch Republic, which attitude facilitated the quick acceptance of Cartesianism.

Works on Logic

In the dedication of the *Institutionum logicarum libri duo* to the States of Holland, Burgersdijk in a humanist way opposed arms to letters. The study of both is imperative for the well-being of the state. In order to be effective, the study of the arts should be methodical. This manual of logic contains all the useful rules of the art of reasoning, which means that the advanced student only needs to practice them. The beginning student should start with an excerpt of this manual, which had been added to the *Institutiones* and was published separately in 1632. It uses the catechetical form of questions and answers. In the preface, Burgersdijk attempts to justify the publication of the new schoolbook. He distinguishes between three groups of manuals. The first group consists of manuals, which adhere closely to Aristotle’s text – Burgersdijk uses the Greek expression *kata podas*. Such philological textbooks are insufficient as manuals of logic, since the *Organon* is without order. Moreover, while focusing on the syllogism, Aristotle does not deal with many logical instruments. The second group is formed by Petrus Ramus, Rudolph Agricola, and Lorenzo Valla. They reject the Aristotelian tradition and follow Cicero and the Stoics. Their textbooks are well ordered, and their precepts are useful in order to interpret famous authors, but “in one stoke”

they wipe out the demonstrative syllogism. That is why we should follow the example of Bartholomaeus Keckermann – the last group consists of only one manual – and adopt “the method of Ramus and use the material of Aristotle.” The main difference between the *Institutiones* and Keckermann’s *Systema* is that Burgersdijk replaces the traditional tripartite structure of logic – simple terms, proposition, and argument – by a bipartite one. He distinguishes between the *thema*, i.e., all the things presented to the mind in order to acquire knowledge of it (book 1), and the instruments, i.e., definition, division, syllogism, and method (book 2). Moreover, contrary to the *Systema*, the text consists of a series of propositions called *theoremata*, often followed by a commentary in which the theorems are explained and sources and illustrations given. The book summarizes the material with ten diagrams according to the model of Ramus.

Works on Physics

Physics is the most noble part of philosophy, since it leads man from the manifold things in nature we perceive by the senses to their hidden causes and finally to God. To physics, Burgersdijk devoted two manuals. The *Idea* is conceived as a “guide” to be used in disputations, presenting the subject matter in definitions and short theses. By referring only to “new” authorities such as Jacopo Zabarella, Benedict Pereira, Franciscus Toletus, and the commentators of Coimbra, Burgersdijk stated as his goal to open the debate on the “text of Aristotle.” In the more extensive *Collegium*, the same doctrinal tradition is elaborated in a synthetic order. The first section of the thirty-four disputations deals with basic topics such as “the subject of the science”: the natural body, its principles – matter, privation, and form – and the final and efficient causes. This section continues with the properties of natural body – magnitude, place, motion – and time and reflects Aristotle’s *Physics*. The second section deals with more specific and concrete topics, such as the heavens and the stars. The *Collegium* continues with the

elements, the origin and destruction of things, the atmospheric phenomena, and what we would now call chemistry and mineralogy. Here the corresponding parts of the *Corpus Aristotelicum* are *De Coelo* and the *Meteorology*. From disputation 20 onward, the soul, its functions, and faculties are treated. These are themes Aristotle dealt with in his books on generation, parts of animals, and the soul.

It is obvious that the structure of Burgersdijk’s manuals on physics is not simply a matter of didactic convenience, but mirrors the complexity of nature, which requires a study by means of the golden principles of Zabarellian method. These new ideas on the order of nature, however, conceal a framework of the traditional concepts of scholastic physics: motion arising from an internal principle, generation and corruption, the beginning and the end of motion, and locomotion, which was produced by the principles of the natural body. What is more, Burgersdijk did not take much notice of important discoveries such as the sine law of light’s reflection made some years before by his colleague Willebrord Snellius, which prepared the way for the mathematical calculation of natural phenomena. Burgersdijk, however, acknowledged a primitive form of the circulation of the blood discovered by William Harvey in 1628. Other examples of his readiness to accept new observations are his acknowledgement of the appearance of new stars, notwithstanding Aristotle’s doctrine of the incorruptibility of the heavens, and his acceptance of the plausibility of the “Copernican hypothesis.” If the diurnal motion is attributed to the celestial bodies and not to the earth, the speed of the diurnal motion observed by Philippus van Lansbergen would imply that Saturn in 5 min traverses more than 900 German miles and the fixed stars more than 643.000 miles. This is hardly conceivable.

Burgersdijk never pondered the theoretical implications of these observations. Apparently he did not see how these new discoveries could be integrated into the Aristotelian framework of physics. Within a generation after his death, the majority of Dutch scholars had embraced Cartesianism.

Manual of Metaphysics

In 1645, 10 years after Burgersdijk's death, the Leiden professors of theology asked the Governors to establish a chair for the teaching of metaphysics. This concern corresponds with the argument that Adriaan Heereboord, Burgersdijk's successor, developed in the preface to his posthumous edition of Burgersdijk's manual the *Institutiones metaphysicae*. Metaphysics clarifies the concepts the theologians use and teaches them "all the natural intellect is able to know about God, the angels, and the rational soul." Therefore, metaphysics is properly called natural theology. The edition of his lectures shows that Burgersdijk in defiance of the statutes of the humanist university already taught metaphysics well before 1645. In defining the object of metaphysics as *ens reale qua immateriale* [real being in its immaterial aspects], Burgersdijk attempted to distinguish the discipline from (Christian) theology and physics. Although he did not adopt definitions of a Scotian and Suarezian type metaphysics in his view is essentially a general science of being, and does not refer to substances only, but also to all beings which are not absolutely nothing. In accordance with the Aristotelian theory of science as developed in the Middle Ages, Burgersdijk continues with the principles of being – essence and existence, definitions, and axioms – and its affects. Under this heading, the Suarezian theory of the transcendental terms is dealt with. In the second book, special metaphysics is discussed: God, angels, and rational soul. Burgersdijk, however, does not only divide being into created and uncreated, but uncomfortably also into substance and accident, which is dealt with in the last chapter.

Manual of Moral Philosophy

In the *Idea philosophiae moralis* a humanist vein, Burgersdijk elaborates upon the preeminence of ethics. The use and necessity of the discipline is obvious, since it teaches us the end of all human endeavor. Moreover, we learn – as far as possible in post-Fall conditions – the means to acquire this ultimate human felicity: the virtues. Their main categories are probity, which composes our

passions and rules our relations with other humans, and piety, which consists of our knowledge and love of God. In this sense ethics is even more than metaphysics a natural theology. According to Burgersdijk, Socrates, Plato, Epictetus, Plutarch among the Greeks and Seneca and Cicero among the Romans were just as important scholars in the field of morality as Aristotle, so Burgersdijk discusses the text of the *Ethica Nicomachea* together with the works of these other authors. Like his Leiden predecessors Petrus Bertius and Justus Lipsius, he reserves an important part of the manual to the theory of the passions. In general, the material is substantially, but freely, taken from Aristotle, as the subtitle states. Burgersdijk, for example, rejects the traditional Aristotelian distinction between *poiesis* and *praxis* made on account of its effect and observed that the making may be an end in itself, while the moral nature of an action depends on the appetite. According to Burgersdijk, moral philosophy is divided into three chapters: (1) the final felicity resulting from attaining the ultimate good; (2) moral actions, the object it studies, outlining their differences and immediate causes such as the affects and pleasure and pain; and (3) the means to achieve felicity, that is to say virtues and friendship. So also this manual methodically presents the Aristotelian material in order to be pedagogically effective.

Manual of Politics

Burgersdijk's manual of politics and economics the *Idea oeconomicae et politicae doctrinae* was also edited posthumously. The first edition was anonymous, but done by Heereboord, the second edition by Georgius Hornius, at that time professor of history, who added extensive notes, but skipped the section on economics. These notes are partly in the form of additional theses, partly in the form of questions, and include elucidating schemes. The manual is special, being one of the few works on these topics written by a philosopher. – At Leiden as a rule historians dealt with politics. – It was conceived as specifying the universal rules of the general practical science, ethics, and applies them to the life of man in a family and in a state. Burgersdijk's politics has

been called a “humanist mirror of the prince.” After an introductory chapter on the body politic in general and the different forms of government, he elaborates on the knowledge and the virtues of the “good” prince. He has to be familiar with languages, Latin in particular; mathematics, which is extremely useful, both in war and peace; the philosophical disciplines, with the exception of metaphysics; the principles of law and of theology; and ancient and modern history. The virtues the prince requires are the traditional prudence and justice, but also piety toward God and toward man, i.e., the love of the citizens, veracity, and the ability to participate in social life. In the second part of the treatise, Burgersdijk deals with the means of government: laws, advisors, health care and schooling, the administration of justice, the maintenance of a monetary system and taxation, the protection against natural disasters, and the preparation for war. Moreover, good government is impossible without the preservation of true religion. The prince is the protector of the church, which implies that he possesses the *ius circa sacra*. Notably, the Contra-Remonstrant Burgersdijk does not specify the proper rights of the church. Although the good prince will punish blasphemy and will prevent the propagation of a false religion, he is not obliged to enforce religious unity at all costs. In the remaining four chapters, Burgersdijk discusses aristocracy and democracy. Living in a Republic, Burgersdijk’s preference for monarchism caused much surprise. Commentators are inclined to explain this curious phenomenon by referring to the force of tradition. However, Burgersdijk argued that in the commercial cities of Holland, the best form of government is a combination of aristocracy and democracy. The predominance of the nobility in a monarchy would be detrimental to commerce and industry, he observes, anticipating similar comments by Pieter de La Court.

Burton, Robert

Born: 8 February 1577, Lindley, Leicestershire, England

Died: 25 January 1640, Oxford, England

Grant Williams

Department of English Language and Literature,
Carleton University, Ottawa, ON, Canada

Abstract

Robert Burton was an English clergyman and fellow of Christ Church College, Oxford. Although he was appointed vicar of St. Thomas's Oxford in 1616 and vicar of Seagrave, Leicestershire, in 1630, he led a rather scholarly and bookish existence at the university. His significance rests solely on his treatise *The Anatomy of Melancholy* (1621), the largest and most comprehensive treatment of the disease in English.

Biography

From the time of his admission, Robert Burton remained a student of Christ Church College for his entire life, earning only a Bachelor of Divinity as well as a BA and MA. Burton is known chiefly for his book, and this book is strongly bound up with its author. *The Anatomy of Melancholy* came out in six separate, seventeenth-century editions, which attest to its popularity with contemporary readers. Its popularity may have been a consequence of the Renaissance's fascination with melancholy, since feigning its symptoms offered courtiers, like Hamlet and *As You Like It's* Jacques, a fashionable posture through which they could express their individuality, if not affected unsociability. *The Anatomy* was also famous on account of its learnedness, supplying readers with a storehouse of ready anecdotes and sayings from approximately 1000 different authors.

Burton pushes to a baroque extreme the humanist predilection for quoting authorities, and, though the text has been said to defy generic classification, it may be called, at least in its

method, a *cento* – what the period regarded as a patchwork composition of citations. The term appropriately captures Burton's scholarly practice of plundering Latin and English sources for textual rags and ribbons to stitch into his own motley fabric. At Oxford, he had, indeed, considerable material to work with. He made use of the Bodleian, while, as a student of Christ Church, he had at his disposal his college's library, to which he was named Keeper in 1626. And he was an avaricious bibliophile too, having amassed a personal collection of 1700 volumes, an exceptional cache for an Oxford Don.

The Anatomy's title page gives Burton the alias of Democritus Junior, associating him with the pre-Socratic philosopher who sought to discover the seat of melancholy through dissecting animal carcasses. But, whereas his namesake chose an empirical route to the problem, Burton figuratively anatomizes books to uncover as many commonplaces about the disease as possible. Besides representing his cento method, "anatomy" could also mean in the period the analytical process of dividing something into its constituent parts, and Burton's treatise accordingly articulates a desire both to master melancholy in its various manifestations and to gain control over his book's massive bulk, the revisions of which led to its continual expansion. Burton performs these two anatomies by leveraging the Ramist method, a pedagogical practice of progressively dichotomizing a topic from the general to the particular so that it can be easily comprehended. Headings break down the text into "partitions" and three types of smaller division, namely, "sections," "members," and "subsections." Each of the book's synoptic charts maps out one of the three overall partitions, the first containing melancholy's causes and symptoms, the second covering its cures, and the third recursively reproducing the former two partitions in examining its three species – love melancholy, jealousy, and religious melancholy. The metalanguage of medical discourse that determines many of the headings conforms to Galenic categories; however, Burton's playful commentary, especially in his preface and long formal digressions, troubles these distinctions with a reflexive and skeptical attitude. Throughout the text, symptoms can slide into causes, and causes slip into cures,

while his humanist amplification of exempla, commonplaces, and quotations often leaves him exclaiming upon the infinite nature of melancholy's signs in addition to the never-ending production of the printing press.

Burton does not confine his encyclopedic subject to the aegis of medicine but allows it to metastasize into a universal condition afflicting everyone and everything, while its pursuit provides him with a hermeneutic key to understanding the fabric of all texts and knowledge, even the cosmos itself. In its capacity as a metaphor for the malaise of existence, Burton's approach to melancholy takes some of its satirical prompts from *The Praise of Folly*. Democritus Junior's madcap utterances foster further parallels with Erasmus's avatar insofar as the former paradoxically betrays melancholic symptoms and signs in his preface – perhaps fueling the posthumous legend that he moved his hand to self-slaughter, rendering him a victim of the disease that he devoted so much of his life to studying.

Byzantine Philosophy, Renaissance

Abstract

The philosophical debate in the early Byzantine Renaissance has been characterized primarily by a significant renewal of interest in ancient philosophy and by a wave of scholarship attracted to Western theology. The study

of secular philosophy was not undertaken as a way to improve theological knowledge or method, and consequently the equilibrium between these domains was maintained. The openness to Latin theology has been made possible by the activity of translation of Latin texts at the Dominican monastery of Pera in Constantinople, which involved philosophical and theological works until that time unknown to the Byzantines. Whence, an innovative philosophical trend took life, that of the so-called Byzantine Thomism, alongside the reception of the Scholastic method, consisting in the adoption of secular speculation and syllogism in theological reflection. These speculative paths, hitherto largely autonomous, were destined to come into conflict in the frame of the Hesychast disputation. By this quarrel, which ended with the triumph of Gregory Palamas' doctrine of uncreated energies, philosophy and theology were established on parallel tracks, and significant attempts of overlapping their areas of competence were generally avoided. As a consequence of these developments, fifteenth-century philosophical scholarship was characterized by a progressive focusing on Hellenic philosophy, while theologians opposed systematical criticism against Pagan philosophy. The philosophical debate gave life to new perspectives, such as the project of restoration of ancient Hellenism envisaged by Gemistus Pletho, and produced recurrent debates between Aristotelians and Platonists (Bessarion, George of Trebizond). Byzantine humanism was destined to survive after the Fall of Constantinople in Italian Renaissance, where it played a large influence, while the intellectual life of the Byzantines living under the Ottoman rule was engaged in the task of preserving and transmitting Hellenic learning and Orthodox theology.

Heritage and Rupture with the Tradition

The Historico-political and Cultural Context

The application of the historiographical category of Renaissance to Byzantine philosophy from the

fourteenth to the first half of the seventeenth century requests the adoption of many nuances and needs more precisions than the common comprehension of this category applied to Western philosophy of the same period. The meaning of the word "Renaissance" not only implies a general flourishing in the fields of culture and arts but also suggests the undergoing of a radical renovation which revolutionized the global perception of the world, and deeply influenced culture and arts in all their expressions. Byzantine fourteenth century has been characterized by a general renewal that is conventionally defined as "Palaeologan Renaissance." This period was opened by the reconquest of Constantinople in 1261 from the Latin Empire, which was established after the Fourth Crusade and the Sack of the City (1204). Its name derives from the dynasty that ruled on the remains of the Roman Empire from that date until the fall of the City under the Turkish armies in 1453. The Palaeologan Renaissance involved all of the fields of art, literature, science, and philosophy but paradoxically was a period of political, military, and civil decadence, which preludes to the final catastrophe. Philosophical speculation during this period had to be influenced by these major historical events and cannot be understood without considering the network of cultural exchanges, especially with the Latin West, that were intensified in the Palaeologan period as never before in Byzantine history.

The Palaeologan dynasty restored the capital of the Roman Empire in Constantinople, after almost 60 years of exile of the legitimate Byzantine rulers in Nicaea. The conquest of Constantinople by the Christian Western crusaders in 1204 constituted indeed a moment of political and institutional discontinuity, but it did not provoke by any means the end of the Byzantine culture, which knew a significant continuation in the temporary Empire of Nicaea. The reconquest of the capital by Manuel VIII Palaiologos in 1261 allowed subsequently the renewing of Byzantine culture in its traditional geopolitical area and gave life to a remarkable flourishing in almost all of the intellectual domains. It will be only after the Fall of Constantinople in 1453 that Byzantine culture will be constrained to survive in a radically

overturned context. The end of the Palaeologan Renaissance coincided with the extinction of the political space of the Byzantine civilization and represented its last period of cultural renewing. Nonetheless, also the beginning of the Palaeologan culture was more influenced by external factors, i.e., the historical and political context, than by merely deriving from an inner cultural development. As a matter of fact, the Fourth Crusade, ended with the Sack of Constantinople perpetrated by the crusaders, and the following assumption of the power over the capital and part of the former territories of the Empire by the Latins, provoked a major shock that deeply undermined the Byzantine awareness of the prestige of their history and identity. This catastrophe involved also major religious aspects, as the loss of confidence in the providential role of the Empire and the withdrawing of divine favor and protection over the Polis. These consequences weakened the universal and ecumenical conscience of the Byzantines and introduced an ethnical point of view into their perception of their identity and culture.

It is not by chance that the word "Hellene," which was used formerly by the Byzantines to address the Greek pagans, by the mid-fourteenth century appeared rather customarily as synonymous of "Rhomaioi," which is the name of the citizens of the Roman Empire, as the Byzantines has always considered themselves. The confrontation with the West, triggered by religious, political, and military tensions, had also significant effects on Byzantine intellectual life. On one side in fact the Crusader Sack of the Imperial City harshened the old theological and ecclesiastical divisions that have determined the separation between the Church of Rome and the Eastern Churches in 1054, but on the other side, the political situation after the Fourth Crusade and the reconquest of Constantinople imposed a new dialogue in search for the reunion of the Churches. The need for the restoration of the union with the Roman Church was considered in fact by the Palaeologan dynasty as an insurance against potential new attacks by the Westerners. Two attempts of union were made, the first at the Council of Lyon, held in 1274, and the second at the Council of Ferrara-Florence in the years

1438–1445. In both cases, the act of union signed by both Latin and Byzantine delegations was rejected by the Emperor, after the repudiation by the majority of Byzantine episcopate. The union of Florence, attained in the dramatic situation of the Turkish threat, was rejected after the leading example of the Metropolitan of Ephesus, Mark Eugenikos (1392–1444), who denounced the ephemeral union as a sacrifice to the need of arresting the Turkish advance, while not reflecting at all the theological position of the Eastern Church. Even if both these attempts of union did not reach the hoped goal, and even if the historical scenarios and political motivations beyond them were sensibly different, they constituted an important occasion of encounter between eastern and western theological paradigms and speculative orientations, which constituted an important ground for the renewal of the Byzantine philosophical culture out of its traditional boundaries.

One of the main features of the philosophical debate throughout the Palaeologan Renaissance was the interest in Greek antiquity. In the domain of Byzantine philosophy, this was not the first wave of attraction for ancient philosophers. We have in fact to recall the emblematic case of eleventh-century Platonism, embodied by Michael Psellos, John Italos, and Eustratius of Nicaea. The distinction of field between dogmatic theology and philosophical learning was a common feature of the intellectual trends in early Palaeologan Renaissance. This feature marked a substantial difference from western Scholastic theology, whose methodological peculiarity was the search for a synthesis capable to compose in a unified system the philosophical with theological and scientific knowledge. The lack of an attempt to overlap philosophical speculation to the domain of theology was at the base of an equilibrium that has generally characterized Byzantine thought through the ages. It is not astonishing that the statesman and Aristotelian scholar Theodore Metochites (1270–1332), who was the pious patron of the impressive decorations of Chora monastery in Constantinople, has been the teacher both of the champion of Hesychasm, Gregory Palamas, and Palamas' opponent, Nicephorus Gregoras. Byzantine philosophy in the Renaissance, since the early

Palaeologan age, was a Greek renaissance, because one of its primary features was embodied by the rediscovery of the classics. Nevertheless, with the only remarkable exception of George Gemistus Pletho, this revival was never invoked as a religious alternative to Christianity. The equilibrium between humanistic learning and orthodox theology was ensured by self-acknowledging of humanists as true orthodox Christians and by philosophical education that also the theologians used to receive. Gregory Palamas, for instance, recalled of having being publicly praised by his master Theodore Metochites for his competency in Aristotelian philosophy.

A significant break of this equilibrium nevertheless arrived: it happened in the circumstance of the polemics raised by Barlaam of Seminara (1290–1348) against the Hesychast monks of the Mount Athos. The reaction of their most skilled spokesman, Gregory Palamas, repurposed once more in Byzantine philosophical history the clash of methodological and speculative paradigms between Christian orthodoxy and pagan philosophy. The combination of interests for ancient philosophy as well as for scholastic philosophy in Baarlam was indeed at the origin of the Hesychast debate, which provoked the most important theological disputation that was originated by late Byzantine though. This debate lasted for approximately 30 years and established a turning point in the development of Byzantine philosophy in the Renaissance. The theology of energies, which was Palamas' main focus constituted a major renewal in the mainstream of Orthodox theology, but it was also a significant confrontation of opposite ontological models, which presumed a skillful usage of philosophical argumentations and concepts. The debate was ended by the triumph of the Palamite doctrine, which was approved by two ecclesiastic synods. This resolution sanctioned the definitive separation of philosophy and theology in forthcoming Byzantine intellectual developments. The Hesychast debate as well as the discussions held at the Council of Firenze-Ferrara has made evident that among the Byzantines prevailed a hard core of theologians who were not inclined to evolve the theological speculation toward a compromise with the secular wisdom of the ancient Greeks.

Even if this position prevailed and was fixed – due to the Fall of the Empire – throughout the forthcoming centuries, the Byzantine philosophical culture in the fourteenth and fifteenth centuries knew also a growing interest in contemporary Western Scholasticism. This aspect constituted a radical novelty in Byzantine intellectual life, and one of the most original aspects of the Palaeologan Renaissance, since the speculative issues of Western Christianity, has remained undisclosed to the Byzantines until then. Greek-speaking theology remained in fact impervious to the texts of the Latin Fathers, not to speak of the complete lack of knowledge of the Late Antique Latin secular philosophy. Also Western medieval theology and philosophy never attracted the curiosity of the Byzantine scholars. A first window of interests in Latin speculative production was opened by the missionary expansion of western monastic orders after the Latin Sack of Constantinople (1204). After this date, new foundations depending on western monastic orders were established with the aim of starting an action of preaching and proselytism. The Dominicans, which were the order of the Preachers Friars by definition, founded some monasteries, among which the most reputed convent of Pera (the district of Constantinople bordering the eastern seaside of the Golden Horn). By the fourteenth century, this convent became the center of diffusion of the Scholasticism into the Christian East. Moreover, the Council of Lyon, despite its failure in the achievement of the union between the Churches, engaged a confrontation which led the Byzantines to focus their attention on the until then unknown theological texts of the Latin tradition. The Emperor Michael Palaiologos asked for the translation of some of the most representative Latin theological and philosophical texts in order to have a better insight into the dogmatic positions held by the Westerners, on which disagreement the looked-for union was still far away. Maximus Planudes' pioneering work of translation found its place into this historical scenario. Maximus (1260–c. 1305), a monk born in Nicomedia, translated for the first time important works of the Latins philosophical and theological tradition, such as Augustine's *De Trinitate*, Boethius' *De*

consolatione philosophiae, Cicero's *Somnium Scipionis* with the commentary of Macrobius, as well as other literary works. After Planudes the biggest contribution to the eastern diffusion of Latin speculative works, either philosophical or theological, was given by those Byzantine scholars who have attended the theological college of Pera, where they learned Latin and became familiar with the methodologies and the arguments of Latin Scholasticism and particularly with Thomism. It was the case of the brothers Demetrius (1324–1397) and Prochorus Cydones (1335–1371), of Manuel Calecas (†1410) and John Kyparissiotis (1310–1378/1379), and of the Patriarch of Constantinople Gregory III Mammas (†1459).

Ultimately, we can list three major features characterizing Renaissance Byzantine philosophy: the recovery of ancient Hellene learning, the speculative enrichments issued from the Hesychast-Palamite debate, and the discovery of the Latin scholastic tradition and its philosophical elaboration. The importance assumed by the rediscovery of ancient philosophy played in fact a role that was unknown to all speculative trends of the former medieval period. However, despite the new relevance obtained by ancient philosophy, Renaissance Byzantine thought cannot be reduced to the mere exegesis of the texts survived from the Antiquity. Consequently, a more wider comprehension of what means philosophy in the Byzantine Renaissance should also extend to the debates in which conceptual aspects of both philosophical and theological thoughts were involved.

The Recovery of Ancient Greek Philosophical Learning

The general revival of interest in ancient Greek learning during the Palaeologan Era established the frame for the renewing of the studies in ancient philosophy. The most striking aspect of this revival is that philosophical Hellenism was no more considered as the poisonous legacy of the pagans, but as an element of the cultural identity of the Byzantines. Unlike the Latin west, the Byzantine culture has never known archaeological fascination for the classics and never had a cultural shock in recovering ancient philosophical

works, since the textual treasures of the antiquity have been always available in Byzantine libraries. Moreover, Byzantines shared the same language of ancient philosophy, so they did not have to pass through the slow process of translation as the Westerners. In the Latin west, the recovery of the classics was a constant aspiration since the Carolingians, and the rediscovery of Aristotle between twelfth and thirteenth century produced a cultural shock that compelled theologians in the search of a synthesis between the Stagirite's philosophy and Christian doctrine. The Byzantines did not attempt such a synthesis, and this perhaps diminished the originality of their results, compared to Scholasticism, which used Aristotelian philosophy to elaborate a new understanding of reality whereby the problems of ancient philosophy were faced at the light of Christian faith and vice versa.

Aristotelian philosophy always attracted the interest of Byzantine scholars from the beginning of the fourteenth century, when Aristotelian studies were approached by two opposite epistemological perspectives, those of Nikephoros Choumnos (1250/1255–1328) and Theodore Metochites. Both were statesmen who became monks in the last part of their life, and both embraced the study of secular philosophy carefully avoiding every possible conflict with the Christian dogmatic tenets. Choumnos manifested interest in Aristotelian science while rigorously holding the traditional apophatic approach to theological knowledge. His writings included nine scientific treatises of Aristotelian inspiration, in which he discussed topics such as the nature of the cosmos, the imperishable bodies, the existence of primordial matter, and the status of separate forms. In all these topics, he contended against what he found in disagreement with the cosmology issued from the Bible. Thus, he denied the existence of bodies composed by a fifth imperishable element, as Aristotle held, and opposed the theory of the pre-existing matter. Finally he argued against the theory of separate forms, holding that matter and form are created simultaneously. He also wrote a *Refutation of Plotinus on the soul*, in which he confutes the platonic theory of the pre-existence of the soul and the theory of reminiscence, relying on Aristotelian

psychology adapted to a creationist perspective. Theodore Metochites wrote an exposition of Aristotelian natural science (*Eis panta ta Physika Aristotelous*), composed of 39 chapters on physics and psychology, biology and meteorology. In the 1320s he engaged in polemics against Choumnos, who accused him for lacking in clarity in his writings. Metochites answered by accusing his rival of being limited to the knowledge of ancient physics while ignoring the superiority of Ptolemaic astronomy and mathematics. As a true humanist, even if this definition applied to him has been challenged by modern historiographers, Theodore conceived Byzantine civilization as the continuation of the ancient Greek culture, and he often used to call "Hellenes" rather than *Rhomaioi* his contemporaries citizens of the Roman Empire.

George Pachymeres (1242–c. 1308), the foremost historian of the early Palaeologan Era, also gave a remarkable contribution to the knowledge of ancient philosophy. He was both a Platonic and Aristotelian scholar. One of his most renowned work, written between 1278 and 1302, was the adaptation of the commentary by Maximus the Confessor on pseudo-Dionysius' writings, concluded by an original paraphrases of the pseudo-Dionysian *Letters*. He also composed a summary of several Aristotelian treatises, collected together with a series of long quotations in a work entitled *Philosophia*. Pachymeres' philosophical interest in Platonism is demonstrated by the handwritten copies he made of seven Platonic dialogues and three Neoplatonic commentaries, one of Hermias on *Phaedrus*, and two of Proclus, on *Parmenides* and the *First Alcibiades*, all of these conserved in surviving manuscripts. From Aristotelian materials assembled by Pachymeres, Joseph the Philosopher (1280–1330) composed around 1323 his *Encyclopedia* of rhetorical and scientific knowledge. Joseph chose monastic life, but unlike many monks of his time, he was persuaded of the usefulness of secular philosophy. He conceived his work as a synthesis of the "inner wisdom" of Christians and the "outer wisdom" of ancient Greeks. Nevertheless he had to admit the errors of ancient philosophers on many topics, among which the doctrine of the soul. Alongside with Pachymeres' florilegious, Joseph used

analogous philosophical compilations realized by other Byzantine authors, like Nikephoros Blemmydes and Michael of Ephesus, as well as the works of theologians like Maximus the Confessor, and ancient commentators like Alexander of Aphrodisias.

Another important exponent of the early fourteenth century has been Nicephorus Gregoras (1296–1361). He is acknowledged as the most remarkable among Theodore Metochites' pupils. He taught in the school attached to the monastery of Chora, whose library, enriched by the manuscripts owned by the same Theodore, was one of the most outstanding of the capital. Nicephorus was a philosopher and historian, and following the epistemological path traced by his master, he was also a skilled astronomer and mathematician. His erudition and literary taste made of him a relevant figure of Byzantine humanism. He imitated the model of Plato's dialogues, and unlike his master, who was more deeply involved in the imitation of his classics models, Gregoras used prevalently ancient philosophical texts as source of quotations. He wrote few properly philosophical works, but he expressed a quite original position, conceiving Plato's thought as more acceptable to Christians and denying that Aristotle was more compatible to the dogmas of faith, as it has been traditionally assumed. In a work dating around 1347–1349, he composed a miscellaneous series of eight questions and answers, where he assumed that Aristotle was more a sophist than a real philosopher. In the domain of cosmology, he denounced contradictions in Aristotle's *De Caelo*, while in the domain of psychology, he believed, by mistake, that the Stagyrte denied the immortality of the soul, unlike Plato. Gregoras' most successful and popular work was however a commentary on Synesius' *On Dreams*. He observed that Synesius was closer to Plato's views, according to whom dreams are sent by the gods, while Aristotle comprehended the dreams as the product of imagination and as projection of conscious thought. In this case Nicephorus was more favorable to Aristotle's position than to Plato's one. Nicephorus had also a role to play in the Barlaam-Palamas disputation, opposing both of them: he wrote a caricatural dialogue against

the first and assumed the leading role of the anti-Palamite party after 1350, addressing against the Athonite theologian a series of polemical writings, the *Antirrétikoi Lógoi*.

The reappearance and the diffusion among Byzantine scholars of a wide interest in the study of Ancient philosophers became a common feature of the intellectual life throughout the Renaissance. Early Palaeologan authors engaged themselves in the redaction of anthologies, commentaries, manuscript copying, and exegesis, but they carefully avoided to exploit in the theological reflection the issues of ancient philosophy involving metaphysics, politics, and religion. Most of them were aware of the difficulties to adopt pagan doctrines conflicting with the Christian dogmatic standing points. The two main exponents of this attitude were Theodore Metochites and Nicephorus Gregoras. The first was closer to Platonism, but also expressed interest in Aristotle, the second noticed more reconcilable aspects in Plato than in Aristotle. The tendency to polarize Plato and Aristotle found its first evidence among the scholars of the early Byzantine Renaissance, anticipating the harsh polemics that opposed pro-Plato and pro-Aristotle scholars in the late Renaissance. This attitude puts in evidence that the reception in the Byzantine Renaissance of the two major Greek philosophers avoided the methodological approach held by the Neoplatonic school, whose exponents looked for the concordance between them.

Innovative and Original Aspects

Byzantine Thomism and Anti-Thomism

The discovery of the philosophical theology of Thomas Aquinas in Byzantium was made possible due to the missionary action of the Dominican friars at the convent of Pera. They were also responsible for spreading into the West of summaries of Byzantine theology, whose purpose nevertheless was more apologetic than systematic, as it is possible to observe through the erroneous opinions affecting Aquinas' *Contra errores Graecorum*, which was based on materials issuing from Pera Dominicans. The most innovative

contribution of the Dominican school of Pera has been the launching of a Byzantine movement of Thomist philosophers, whose first impulse was given by the translation of Aquinas' works. This task was accomplished by the Cydones brothers and some other yet unknown translators (hypothetically Maximos Planudes and Manuel Calecas). Demetrius translated the *Summa contra Gentiles* in 1354, and the *Summa Theologiae* between 1355 and 1368, and other minor works. His brother Prochoros helped him in translating the *Summa Theologiae* and translated the *De aeternitate mundi*.

Demetrius Cydones was born in Thessalonica in 1324 and studied under Nilus Cabasilas. He occupied important roles in the administration of the state and was a skilled diplomat, devoting himself to the making of alliances in Western Europe finalized to front the Turkish menace, but his efforts were unsuccessful. Demetrius has been the most remarkable Byzantine Thomist: one of his principal aims was to demonstrate the unity of Eastern and Western theologies. His attraction for Thomism is mainly explainable through the novelty of the Scholastic method, based on the agreement of faith and reason. In the Scholastics in fact, Byzantine scholars found a model of theological exploitation of the arguments of ancient philosophers. Accordingly, Demetrius stated that Westerners "show great thirst for walking in those labyrinths of Aristotle and Plato, for which our people never showed interest." Beside the works of Thomas Aquinas, Demetrius translated also other Latin theologians, like Anselm and Gregory the Great. When his ancient master Nilus attacked the Latin doctrine of the procession of the Holy Spirit, addressing above all Aquinas, Demetrius answered with a work in defense of the Dominican theologian and his views on the procession by adopting the theory of the *Analogia Entis*. Being a convinced Thomist, he did not accept the Palamite distinction between essence and energies in God (a problem that was at the center of the theological debate at that time), since this distinction opposed, to his view, the principle of simplicity and unity in God, which was a firm point of Latin Trinitarian tenets, from Augustine to Anselm and Thomas. Embittered by the triumph of Palamism, which led

also to the condemnation of his brother Prochorus, he converted to the Catholic confession of faith in Rome, in the occasion of one of his embassies. He died in Crete in 1397.

Prochorus Cydones, born in 1335, became a monk at the Great Lavra on Mount Athos. As his eldest brother Demetrius, he was attracted by Latin theology, whom he contributed to diffuse in Byzantium through translations of some of Augustine's, Jerome's, Boethius', and Thomas Aquinas' works. He has been a fierce opponent of Palamism, becoming the head of the opponent movement after Nicephorus Gregoras' death in 1361. Because of his engagement, he was condemned by the Palamite patriarch Philotheos Kokkinos in 1368. More than his brother, Prochoros pursued the application of Thomist philosophy into the theological domain. He wrote a work *On Essence and Energies* in confutation of Palamas' doctrine, which, according to him, was a step toward polytheism. In this work he discussed also the nature of the Taboric light, which was at the center of the Palamite and anti-Palamite discussions. He died in 1371.

After Demetrius Cydones' death, Byzantine Latinophrones found their leading figure in Demetrius' former pupil, Manuel Calecas (†1410). Calecas became a severe opponent of Palamism since its beginnings and because of this Gregory Palamas refused him the monastic tonsure. He then converted to Catholicism and became Dominican friar in a convent in Mytilene. Calecas composed a synthesis of Aquinas teachings, entitled *On Faith and Principles of Catholic Faith according to Scripture and the teachers of Catholic Faith*. While never quoting openly Aquinas, this work shows Calecas' mastership in the philosophy of the Dominican theologian and permitted the diffusion of his doctrines to a wider audience outside the narrow circles of the readers of the translations realized at Pera convent. He translated also Boethius' *De Trinitate* and Anselm's *Cur Deus homo*, and realized Greek versions of several liturgical offices, perhaps for the need of those Byzantines who converted to Catholicism. Following his brother he stepped further in the attempt of harmonizing Thomist philosophy with Eastern theology.

The growing of interest in Western Christian authors consisted not only in a renovation of the panorama of Byzantine philosophical sources but was also a moment of confrontation on methodology, after the example of late-antique Latin theologians, which adopted dialectics and the syllogistic method in theological reflection, and Scholastics, which arrived to the point of defining theology as a science. Anti-Thomist reaction was consequently an answer to Scholastic methodology applied to sacred theology. The first voice against syllogistic method was raised by Barlaam of Seminara (1290–1348), also known as Barlaam the Calabrian, author of two discourses against Aquinas. Another voice of dissension was expressed by Demetrius Cydones' former teacher, Nilus Cabasilas (1285–1363). Cabasilas, who aligned to the Hesychastic movement, and became Palamas' successor on the episcopal see of Thessalonica, argued against the possibility of applying syllogism to theological knowledge at the place of divine revelation, since human logos is inferior to Divine Logos. He did not address Thomas openly in his writings, but Thomist doctrine is plainly recognizable there. Open criticism against Aquinas was instead addressed by Matthew Angel Panaretos (1341–1391), who wrote two works in confutation of Aquinas' doctrine on the procession of the Holy Spirit and the Purgatory. Another opponent of Aquinas and scholastic syllogistic method has been the Hesychast monk Callistos Angelikoudes (1340–1420), who, in his *Against Thomas Aquinas*, denied the identity in God of his essence and his attributes and rejected the possibility of seeing God's essence.

The Hesychast Debate

The Hesychast controversy lasted over 30 years (1335–1368) and has been one of the debates of major impact on the theology of the Eastern Church in his whole history. It had also a great impact on Renaissance Byzantine philosophy, since its discussions provoked the confrontation between the methodological and philosophical trends that featured contemporary intellectual developments, shading light on the underground contraposition between the renewed interest in

ancient philosophy and Scholastics, and the mainstream of traditional Byzantine theology, based upon the Scripture and the Fathers. The polemics between Thomists and anti-Thomists and the debate on the compatibility of some aspects of pagan philosophy with Christianity largely converged into this debate. The Hesychasts held a much more defined position, castled in the defense of the tradition. On the opposite side, we can observe much more nuances, since the configuration of the anti-Palamite party cannot simply be assimilated to the positions of Thomists or humanists: for example, Nicephorus Gregoras, one of Palamas' main opponents, remained hostile to Western Latin theology, and George Gennadios Scholarios (1405–1473), which has been the last great Thomist among the Byzantines, as well as a philosopher and commentator of Aristotle, accepted Palamite theology.

The debate, at the beginning, was engaged by Barlaam the Calabrian. Born in Seminara, he moved from the South Italy to Constantinople where he taught philosophy and wrote some works on logics and astronomy, which found a large audience in the capital city. In 1335 he was asked by the emperor Andronikos III Palaiologos to defend Byzantine position on the procession of the Holy Spirit, in the occasion of the visit of a Roman delegation, whose task was to discuss the union of the Churches. Barlaam wrote a treatise on the *Procession of the Holy Spirit against Latins*, where he argued that human reason cannot demonstrate anything about the Divine. Furthermore, he classified the arguments used by Byzantine theologians to defend the procession from the Father alone as matter of dialectical or hypothetical syllogisms. After learning about the contents of Barlaam's treatise, the Athonite monk Gregory Palamas accused the Calabrian theologian of looking for an agreement with the Latin position. In reality, one of Barlaam's purposes, on behalf of his anti-Western zealotness, was to contrast Thomist reduction of the theological knowledge to the positive affirmation of ontological definitions. In doing this he also exploited the Franciscan nominalistic positions expressed by Duns Scotus and William of Ockham.

Gregory Palamas, born in Constantinople in 1296, studied rhetoric and philosophy at the school of Theodore Metochites. Having become a monk, he renounced to secular studies, accusing in particular Platonism of being an erroneous and deceiving learning. Then he moved to the Mount Athos, where he embraced Hesychast spirituality. Hesychasm was a spiritual method conceived as the search for deification in the inner quiet (*hesychia*) and continuous prayer, consisting in the invocation of the name of Jesus. Palamas' philosophical training allowed him to oppose Barlaam through philosophical arguments. He accused his rival of considering the Father and the Son as two principles deriving one from the other, in a way that lead to consider the Son as the principle of the Holy Spirit. Palamas affirmed also that human syllogisms on God are apodictic and not merely dialectic. Barlaam reacted by detailing further his position on Trinitarian procession and the value of syllogism in theology and by accusing his rival of being "ignorant and uncultivated." Furthermore, he attacked the Hesychasts, alleging them of Messalianism and "omphalopsychism," a neologism by which he criticized the Hesychast conception of prayer as a process involving also the body, through concentration on some of its parts (navel, heart). Finally he denied the possibility, claimed by Hesychasts, to see God's uncreated light through bodily eyes: according to Barlaam, the light is just a symbol of the Divinity and cannot be identified with the same light that has been seen by the Apostles on the Mount Tabor at Christ's Transfiguration. Palamas' confutation of Barlaam's criticism led him to the definition of the distinction between essence and energies in God, claiming, on the ground of Greek patristic apophaticism, that the first remains totally unknown and unreachable to the intellect and cannot be participated by anyone of the created beings. Nevertheless men and angels can participate in the divine life through God's uncreated energies, which are themselves God, but are distinct from his essence. Palamas defended his thesis in a treatise entitled *The Triads*, and synthesized his views in a document, the *Tomos hagioreitikos*, which was subscribed by the most of Athonite prominent monks. A Synod convoked

in Constantinople in 1341 condemned Barlaam's teaching and decreed that Taboric light was truly uncreated God's energy, affirming the validity of Hesychast prayer as a way to attain the experience of divine light and to achieve deification. Disappointed by the condemnation and by the contextual victory of Palamas, Barlaam retired to Italy, where he converted to Catholicism and taught Greek to Petrarca, before being appointed as bishop of Geraci. After 1341 the anti-Palamite party was led by Gregory Acyndinos (1300–1348), once a common friend of both Barlaam and Palamas. Acyndinos refused to admit that energy could be uncreated, since, in this case, it would be the divine essence itself. Secondly he denied the possibility that men participate in something uncreated, since they would be coeternal to God. The disputation entered into its second phase, which turned this time against Palamas. The Athonite monk was persecuted by the patriarch John XIV Calecas, until 1347, when Calecas was removed and Palamas elected as Archbishop of Thessalonica. A third phase of the debate begun thenceforth with Nicephorus Gregoras, who refused, as already Acyndinos did, the distinction between essence and energies in God. The main feature of Palamas' theology was indeed seen as a patent contradiction of the argument of God's simplicity, as also Prochorus Cydones remarked from a Thomists perspective. Another Synod, in 1351, acknowledged definitely the truthiness of Palamite distinction. Palamas died in 1359 and was canonized in 1368 by the patriarch Philotheos Kokkinos, one of his former pupils.

Impact and Legacy

The triumph of Palamism represented a watershed in Byzantine philosophical history. Palamas' epistemology admitted the validity of secular philosophy as a tool of investigation of created beings, but the knowledge of God should have remained within the competence of theology alone. Diminishing the worthiness of dialectics in theological investigation, Palamas emphasized on the other side the value of experience, relying on the

tenets of Hesychast mysticism. This epistemological distinction turned out to be highly influential on future developments of the philosophical and theological method and at the same time was conflicting with the contemporary diffusion in Byzantium of the Scholastic method and Thomistic philosophy. Nevertheless external events, such as the Council of Florence and its failure, and finally the Fall of Constantinople, aligned Byzantine intellectuals on a general anti-Latin sentiment and discouraged any further development of the theological method through philosophy and dialectics. The main tenet of Byzantine theology remained then fixed in the shape of Palamism.

Aristotelianism and Platonism in the Fifteenth Century

The influence of Palamism on the following Byzantine intellectual debate can be noticed, for example, in the attitude of Matthew Panaretos, whose anti-Thomism we have already mentioned above. Panaretos assumed that between philosophy and theology, there cannot be any compatibility, since revealed truth is undeniably superior to the power of the human mind. Nevertheless, he used Aristotelian logics to confute the Latin doctrine of *Filioque*. Similarly, the Cretan monk Joseph Philagrios (1335–1400) cultivated his interest in Aristotelian philosophy and Platonism while engaging at the same time in the theological debate against the union with the Latin Church. He commented on the *Categories*, and established a school of theology and philosophy in his monastery, but always maintaining the separation between secular and religious learning. He also criticized Byzantine Thomists Demetrius Cydones and Manuel Calecas.

Another consequence of the affirmation of Palamism was the shift of interest among Byzantine humanists toward the sole exegesis of the problems of Ancient philosophy, focusing in particular on the confrontation between Platonism and Aristotelianism. As a result of disfavoring the application of philosophy and dialectical method to theological issues, we can also point the extreme reaction of George Gemistus Pletho out. In fact, Pletho (1355–1452), stepping outside the borders of Christian philosophy, devoted

himself to the reestablishment of Pagan polytheism. He studied in Adrianopolis, which was under the Ottoman control since 1365. After traveling in Palestine and Cyprus, he settled in Mistra, the capital of the Byzantine Despotate of the Morea. Here he taught philosophy, astronomy, and history. The location of Mistra, close to the site of the ancient Sparta, offered an evocative scenario for his project of political and moral renovation by recovering ancient Greek paganism through Platonic and Stoic philosophy. He exposed this utopic project in the *Treatise on Laws* (*Nomon syggraphé*), having in mind the foundation of natural religion through dialectics, recurring exclusively to human reason. Pletho had many students: among them, we can remember Bessarion and George Gennadius Scholarios. This latter became Pletho's harsh enemy, and having been elected as the first Patriarch of Constantinople after of the Sack of 1453, he condemned the largest part of the works of his ancient master. Pletho's most important work, which survived from the condemnation, is the treatise on the *Difference between Platonic and Aristotelian Philosophy* (1439), in which he claimed the superiority of Plato over Aristotle through a detailed confrontation of their systems of thought. In particular he criticized Aristotle's *Metaphysics* because its conception of God as the Prime mover and he purposed a defense of Plato's theory of ideas against the Stagirite's criticism. Scholarios replied to Pletho assuming the defense of Aristotle and denouncing his deviation toward paganism. Pletho composed then an apologetic work *Against Scholarios' objections*, in which he detailed his former thesis, and rhetorically presented Platonism as the closest system to the Christian dogma. Another significant disputation based on the confrontation between Aristotle and Plato was animated by two major scholars from Trebizond: George Trapezuntius (1395–1472) and Bessarion (1403–1472). The first wrote a *Comparatio Aristotelis et Platonis*, in which he attacked Plato accusing him of diffusing mythological narrations (metempsychosis) and immorality (the communion of women). Bessarion, former Pletho's student, rejected Trapezuntius' accusations, coming to the defense of Plato in his *Against the*

Calumniators of Plato. Byzantine debate between Aristotelian and Platonist scholars will play over the next decades a great influence on Italian humanism and western Renaissance, making this kind of confrontations a literary genre.

Both the opposing trends that featured late Byzantine speculation, that is, theological traditionalism and humanistic classicism, were destined to seed their legacy in the division of the Byzantine intellectual world in those dramatic years that stretch from the Council of Florence to the Fall of 1453: all the theologians and philosophers who remained faithful to the Byzantine tradition and refused, after Florence, the union with the Catholic Church were tasked to transmit their knowledge to the posterity under the Ottoman rule, which necessarily limited their freedom to pursue original developments. Byzantine humanists, who had the occasion to meet Italian universities and cultural circles in the years of the Council, emigrated to Italy, where they had the chance to continue their intellectual activity and to diffuse ancient philosophical learning in Italian Renaissance. After 1453 we can recognize two major legacies of Byzantine philosophy: in the west Byzantines offered a major contribution to the diffusion of the knowledge of ancient philosophy, by direct teaching and by transmitting the manuscripts brought out of Constantinople. As member of the Greek delegation to the Council without obligation to attend all of the sessions, being layman and secular philosopher, Pletho had the chance to meet Italian humanists. In one of these occasions, according to the witness of Marsilio Ficino, Cosimo de' Medici was among his listeners and received the inspiration from Pletho's talk to promote the foundation of the Florentine Platonic Academy. In this same context, the Byzantine humanist Demetrios Chalkokondyles (1423–1511) helped Marsilio Ficino in translating Plato's complete works.

Bessarion has been perhaps the most influential figure of Byzantine diaspora in Italy. He accepted the union of Florence in 1439, but once back in Constantinople, he suffered the unfriendly attitude against unionists, and when the majority of Byzantine bishop withdrew from the union, having been already invested of the rank of

Cardinal by the pope Eugene IV, he moved definitely to Italy in 1440, where he played an important role in helping Byzantine refugees and rescuing Greek culture and learning. His collection of manuscripts was destined to become the core of the Marcian Library of Venice. Thanks to his contribution, Platonism prevailed over Aristotelianism. Plato's knowledge was diffused in Italy also thanks to Michael Apostolis (1422–1478) and John Argyropoulos, who was more properly an Aristotelian. Argyropoulos (1393/1415–1487), possibly one of Pletho's former students, participated in the Council of Florence holding a pro-unionist position. He studied in Padua around 1444, and once back in Constantinople, he taught Aristotelian logic, medicine, and philosophy of nature. After 1453 he moved to Italy, where he continued his career teaching Aristotelian logics, metaphysics, ethics, and physics. He translated many of the Stagirite's works and gave lectures on Plato's dialogues. Assuming that Plato and Aristotle were equivalent, he declined to take part to the debate on which of the two philosophers was the preeminent. Among Aristotelians the most remarkable scholars were Theodore of Gaza (1398/1415–1475/1476), Andronicus Callistus, and George of Trebizond (or Trapezuntius). The first one taught Greek at the university of Ferrara since 1446, and in 1449 moved to Rome, where he was charged by the Pope Nicholas V to translate several works of Aristotle and revise some of George of Trebizond's translations. Theodore adopted an innovative method of translation, which had a vast influence, but Trapezuntius, being disappointed by the choice to revise his texts, entered in polemics against Gaza's choices of translation. Gaza criticized also Pletho and supported Bessarion in his disputation against Trapezuntius. Byzantine Aristotelianism received another remarkable recognition when, in 1497, the Epirot Nicholas Laonicus Thomaeus (1456–1531) was appointed as lecturer on Aristotle at Padua University, where he distinguished himself by using in his teaching nothing but Greek texts and Greek commentaries, in the attempt to overpass the hegemony of Arabic exegesis.

Byzantine Philosophical Learning After Byzantium

Intellectual life in former territories of Byzantium under the non-Christian rule of the Ottomans or under the non-Orthodox western occupants (as in the island of Crete and in the Ionian see) was subjected to significant limitations. The first aim of Byzantine scholars became consequently the preservation of the legacy of their culture and religion. The century after the Fall of the Empire is considered as the Italian period of Byzantine culture, since the most part of Greek scholars emigrated to Italy. After the generation of Bessarion and Trapezuntios, who were more properly intellectual refugees, by the sixteenth century, we find Byzantine philosophers in Italy fully adapted to the local scholarship mainstream, which means writing in Latin and using Latin and Arabic exegesis of Aristotle. This was the case, by instance, of Michael Sofianos (†1564) and Daniel Fourlanos (†1592). On the other side, those scholars who remained in Constantinople undertook a completely different task, that of ensuring the continuation of the Orthodox tradition and Byzantine learning. Theodore Agallianos (afterward metropolite of Medeia with the name of Theophanes) (1400–1474), beside witnessing the tragic events connected to the Turkish conquest, wrote three works in refutation of the Latin Church, as well as two philosophical treatises, respectively, devoted to the Providence and to the soul. George Amiroutzes (1400–1470), philosopher, theologian, medicine, and statesman from Trebizond, is found later at the service of Mehmed II, the conqueror of the City, whereby he was granted of the privilege of consulting the Greek manuscripts collection at the Topkapi, which was otherwise inaccessible. In Constantinople the preservation of the Byzantine learning was ensured in particular by ecclesiastical institutions such the Patriarchal Academy. One of its illustrious sixteenth-century figures was John Zygomalas (1498–1584), who was engaged in the dialogue with the Lutherans, and contributed to spread the knowledge of post-Byzantine culture in Germany. He played an essential role,

with his son Theodosius (1544–1607), in the transmission of Byzantine and ancient Greek learning. Representative of the conservative theologians, in line of Markos Eugenikos and Gennadios Scholarios, Pachomios Roussanos (1508–1553), born in Zante, criticized many primary doctrinal tenets of ancient philosophy, such as the eternity of the world and the role of the fate, but accepted some aspects of the Platonic doctrine of the soul.

The prevailing conservative orientation in Orthodox theology was destined to exercise an evaluable influence in Russia through the teaching of Maximus the Greek (1470–1556). Born in Arta to a family originated from Mistra, he studied in Italy, where he attended the most important milieux of Italian renaissance, coming into contact, among others, with Marsilio Ficino and the Platonic Academy, Giovanni Pico della Mirandola, and Angelo Poliziano. In Florence he had also the occasion to appreciate the preaching of Girolamo Savonarola. He became a monk at the Mount Athos in 1505, where he changed his intellectual attitude, rejecting his former openness to humanism. In 1518 he moved to Moscow, having been sent as translator of the Bible and the Fathers of the Church after the request of Tsar Basil III. Since he did not know Russian, he translated from Greek to Latin, letting other translators realize the final Russian version. His position was rather critical toward all of intellectual issues other than Orthodoxy: he harshly criticized Latin theology, passing from the accusation against Augustin of having supported the Filioque to the opposition to Scholastic methodology, which – in Maximus' view – gave too much place to Aristotle (in particular to his logics) and Plato, or even to Averroes, and relied excessively on syllogistic argumentations. Nevertheless he admitted the study of philosophy as propaedeutic to the study of theology. He also disapproved Lutherans and condemned all attempts, like that of Pletho, to Hellenize the Byzantine culture. He finally complained the evolution of Russian culture toward the taste of Renaissance, maintaining that Russian Church ought to maintain its Byzantine roots. Relying on the weight of Scriptures and

Patristic authorities, Maximus lacked in originality and anyway he did not support his criticism by rigorous argumentations.

One of the rare schools still open and active was that of Candia (Crete), where scholars like Meletios Pegas (1549–1601) and Maximos Margunios (1549–1602) were trained. Both studied afterward philosophy and medicine in Padua. Pegas, who became thereupon Patriarch of Alexandria, has been a strong opponent of the Catholic Church but accepted the doctrine of Eucharistic transubstantiation. At the opposite, Margunios, invested of the ecclesiastical rank of bishop of Chythera, wrote several theological treatises, in which he expressed a conciliatory view on the Filioque and approved the way Augustin of Hippo exploited Platonic themes in Christian theological argumentation. Generally he accepted the possibility of drawing useful arguments also from secular philosophy. The radical separation of philosophy and theology was instead the methodological principle assumed by Theophilos Korydaleus (c. 1570–1646), who also held that philosophy cannot have any implication in theological reflection. Korydaleus was born in Athens and was trained in Aristotelian philosophy in Padua under Cesare Cremonini. He introduced the study of secular philosophy in the patriarchal school of Constantinople, having been appointed here to the role of teacher and successively of director. His position was attacked by traditionalists like Nikolaos Koursoulas (1602–1652), but finally the Church of Constantinople accepted Korydaleus Aristotelianism, on the basis of the doctrine of the “double truth,” which postulates the equivalence of philosophical and theological truth as two parallel types of knowledge. Starting from these epistemological principles, the official Church gradually accepted the idea of teaching natural philosophy independently from the biblical doctrine of Creation. By the seventeenth century, the Greek orthodox came into the idea of thinking at their culture as the legitimate heir not only of Byzantium but also of Ancient Greece. At the end of the century, a generation of Greek scholars taught natural sciences in Orthodox schools following the teaching of Korydaleus and adopting his writings as textbooks.

Abstract

A Dominican philosopher and theologian, among the main representatives of sixteenth-century Aristotelianism and perhaps the greatest Renaissance commentator on St Thomas's works. He is known for his restatement of the doctrine of the analogy of being and for his innovations in psychology.

Alternate Names

[Caietano](#); [Gaetano](#)

Biography

A Dominican philosopher and theologian. Born in Gaeta on 20 February 1468. Died in Rome on 10 August 1534. Among the most notable representatives of Dominican Aristotelianism, De Vio entered the Order at the age of 16 and studied in Naples, Bologna, and Padua. He became Padua University's professor of Thomist metaphysics, a post he held from 1494 to 1497. In Padua, where he was known as Cajetan, he came into contact with, and often debated with, the followers of Scotus, like Trombetta, and of Averroes, like Vernia, Pomponazzi, and Nifo. He later taught theology in Pavia (1497–1499) and philosophy at La Sapienza University in Rome (1501–1508). He was a senior official in the Dominican Order and in 1508 became its General Master. He was made a cardinal in 1517. From then until 1519, he was a legate in Germany, where he was involved in debates with the Lutherans (Cossio 1902; Groner 1951). In 1523–1524 he was in Hungary, where he dedicated his last years to study and writing.

Innovative and Original Aspects

Cajetan's work mainly belongs to the tradition of scholastic commentary (developing the ideas of previous authors), of which he is perhaps the greatest representative. His philosophical and spiritual guide is mainly Thomas Aquinas, most of whose works he commented on thoroughly. He became the main defender of Aquinas's ideas against those of Scotus and Averroes's followers, which were becoming prevalent in the late fifteenth and early sixteenth centuries. Although his thought is set out as comments on Thomas's, De Vio's Aristotelianism has its own original features which in some cases reinterpret or even modify Aquinas's doctrines. It is in this respect in particular that Cajetan's work was to become a constant point of reference for the doctrines (and the debates) of Spanish Aristotelians, especially Jesuits, who discussed his positions in depth. The most important and original concepts put

forward by De Vio are to be found in metaphysics and psychology.

Metaphysics, The Doctrine of Analogy

Concerning metaphysics, Cajetan is well known for his views on the doctrine of analogy, which emerges in particular in his commentary on Thomas's *De Ente et Essentia* (see Cajetan 1558) and is founded on the prior distinction between the "formal" concept and the "objective" one, through which De Vio develops two senses of the very concept of a being (Gilson 1953; Reilly 1971; Porro 1995; Riva 1995). The first sense, the formal one, is the concept of the representation, generated by a possible intellect, of the thing understood. In this sense then, the being serves as a single representation that brings together substance and accident, God and His creatures, all sharing the status as beings. The second sense, the objective one, is the concept of the thing itself represented by the formal concept, taken as the thing that is known through representation. In this second sense then, the being is not something general and shared by all realities, but is actually a real something that may be assigned to types and categories. By denying the being the possibility of representing in general something objectively common to all realities – substances and accidents, Creator, and things created – De Vio thus puts himself, with Thomas, in opposition to the view put forward by Duns Scotus, whose concept of a being was as a definite objective reality above any incidental categories. Scotus, according to the Dominican, makes the mistake of confusing the formal concept of a being with the objective concept, thus making the being, in its most general sense as a representation, into an objectively real something preexisting in any particular being. From there, Cajetan had to give an account of whether it was possible for a being or its essence to represent something analogically or univocally stable of the substance or of the accident or of God or His creatures, a question De Vio answered by formulating a proposal that was to have great influence on later scholars (McCanles 1968; Ashworth 1995; Porro 1995; Krause 1999). He distinguished between "equivocal" concepts,

i.e., those cases where the same word has different meanings, and “univocal” concepts, where one word has the same meaning, and “analogous” concepts, those where the same word has a meaning that is in a sense the same but in a sense different. Where and when are terms considered analogous? Analogy can be meant in two different ways: one is in “attribution,” i.e., based on the fact that different terms share a relationship to a term that is primary and paradigmatic for the whole set, while the other is in “proportionality,” where a relationship between two terms can be established only in that there is a proportion between them. As far as essence and being are concerned, only this latter form of analogy is possible, since between God and His creatures, there is no sharing of essence or reality in a univocal sense, but only a parallelism based on a proportion. So the formal concept of a being represents what is generally understood to be the essence of whatever it is, including substance and God, whereas in the objective sense, a being can be considered a being in common with other beings only by the nonunivocal means of proportionality. The doctrine of analogy put forward by Cajetan then goes together with his positions concerning the real distinction between being and essence, set out by the Dominican still in opposition to Scotus and Trombetta and in accordance with what Thomas’s teaching on the matter was believed to be (Porro 1995). De Vio was among the supporters of the reality of that distinction, because essence, he argued, always owes its existence to reality independent of it. Being therefore has to be understood in an essentialistic sense, since existence is not, except in God’s case, a predicate of essence, and everything that has being is made up of characteristics defining its essence. By taking this turn toward admitting a real distinction between essence and existence and allowing an essentialistic view of reality, in a way far removed from the primacy of *actus essendi* that had seemed to emerge here and there in Thomas’s work, Cajetan actually opened the way toward the deeply essentialistic version of Thomism (Gilson 1953; Krause 1999) that was to typify Spanish scholasticism (Ashworth 1995, 2008).

Psychology

From the psychological point of view (Cajetan 1938; Laurent 1938; Gilson 1961), De Vio again stayed close to Thomas Aquinas, whose thought he “tidied up” and restated. Cajetan held, like Aquinas, that the act of understanding should be thought of as an “objective” illumination and that the first principles of the intellect are known through sense experience, like the whole of human experience. On the other hand, concerning the human soul, De Vio gave a proof of its immortality and asserted its individuality in disagreement with the materialists, the skeptics, and the Paduan followers of Averroes (Gilson 1961). Like Aquinas in *De Unitate Intellectus*, he held that the immaterialness of mental operations – volition and cognition – revealed the simplicity of the soul and its separability from the body. It is worth noting, however, that on this point Cajetan’s interpretation actually parts company with the doctrines that Aquinas had set out in various versions not always consistent with each other, contributing again to creating a reworked version of Thomism that was to be popular over the following decades and finding in a sense a compromise with the major attacks it had been subjected to by Franciscans and by followers of Averroes from the thirteenth to the fifteenth century.

Cajetan supersedes Thomas’s doubts (and his inconsistencies) about, for example, the separability of the soul by considering it “*praeternaturalis*,” i.e., supernatural, rather than, as Thomas had said in his *Contra Gentiles* IV, 79 “*anti-natural*” (a description he would himself move away from in his *Summa Theologiae* I, 89). Practically then, De Vio thought of the soul, as some of the main Jesuit thinkers would, not just as potentially separable and capable of continued existence outside the body but as separate from it by its very nature, thus breaking with the identification of the soul with the form of the body in Thomas’s thought in opposition to Averroes’s and Plato’s. Accordingly, De Vio himself ended up arguing that the separate soul is more or less the same as an angel-like intellect, which practically paves the way toward thinking of the soul in its separated state as identical with the person’s intellect – a position

that would naturally lead into the kind of intellectualistic concept of mind that would steadily, right through to Descartes, become consolidated among the eclectic thinkers in the Aristotelian school, eating away at the foundations of the strong hylomorphism of the Champion of the Dominicans. Lastly, it should be remembered that De Vio, while clearly an opponent of Averroism as has been said, nevertheless explicitly denied, as a matter of history, that Aristotle's *De Anima* had meant to defend the immortality and uniqueness of the soul, thus conceding victory to Averroes on the question of interpretation, though not that of doctrine, a position that was to be used against the Aristotelians themselves a few years later by Pomponazzi in his *Tractatus de immortalitate animae* (Gilson 1961).

Calcagnini, Celio

Born: Ferrara, 1474

Died: Ferrara, 1541

Sandra Plastina

Department of Humanistic Studies, University of Calabria, Arcavacata di Rende-Cosenza, Italy

Abstract

Celio Calcagnini, one of the most notable cultural figures in Ferrara, Italy, in the first half of the sixteenth century, was a humanist and a man of wide-ranging scholarship, highly erudite, and interested in a variety of fields such as philosophy, science, and religion. A renowned professor of rhetoric at Ferrara's Studio, Calcagnini was a student in the city in the years when Copernicus resided there and studied for his degree.

Biography

Celio Calcagnini, who was born in 1479 in Ferrara, where he died in 1541, championed the theories of Euclid and Ecphantus. His work *Quod coelum stet terra moveatur, vel de perenni motu terrae*, written before 1525 (it was then published in Basel in 1544 and, more recently, by Bacchelli in Italy in 2017), begins with the assertion that it is not the sky that moves, but the Earth. Recent studies have shed new light on his life and work, and some of them emphasized the Nicodemite element in his religious attitudes, and his connection with scholars and scientists of the Reformation such as Jacob Ziegler, a Bavarian scholar who kindled Calcagnini's scientific interests, and physician and humanist scholar Theodor Zwinger.

Calcagnini's efforts at reconciling Aristotelian and Platonic concepts and, above all, his own scientific and astrological knowledge, emerge in the treatise *Quod coelum stat*, which was indicative of the uneasy climate prevailing in Ferrara at the time of Ariosto. The fact that a humanist who was not

without astrological knowledge – though he surely wasn't much of an expert in mathematical calculations and was distant from Copernicus's theoretical presumptions – was trying to dismantle credulous beliefs in the senses in order to assert that the Earth rotates is a remarkable clue from a history of culture perspective. While Calcagnini's notions of physics and metaphysics were undoubtedly set within a traditional framework, as was his world system, the fact remains that his purpose was to debunk the presumptions of Aristotelian and Ptolemaic cosmology, also by making a more independent, critical use of traditional scholarship. Upon his death, Calcagnini bequeathed his “extremely precious library comprising as many as 1,249 volumes” (D'Ascia 2010) to the Dominican monastery in Ferrara where he is buried. His *De libero animi motu*, a small treatise in letter format addressed to Bonaventura Pistofilo and composed in January 1525, is not so much a Nicodemite-style apology of the bondage of the will but rather a comparison of philosophical opinions which, for its moderate outlook, is akin to the collating of biblical passages initiated by Erasmus (Calcagnini 1536). Like Cicero, Calcagnini combined practical dogmatism, which led him to reject Luther's doctrine of salvation through grace and to defend good deeds, with a degree of theoretical skepticism and eclecticism, which justified the oratorical practice of *declamatio in utramque partem*. It is worth noting that Calcagnini did not own any of Luther's works, while he appeared to be very open to Reformist thinkers who focused on themes closer to humanistic inclinations. He was a friend of scholar Pellegrino Morato, a die-hard advocate of the use of Latin who was much involved in Ciceronian controversies. Calcagnini was an influence on the education of poetess Olimpia Morata and in the composition of an oration in defense of Cicero, now lost, which the 14-year-old girl wrote after reading Calcagnini's critique of Cicero's *De officiis* (Plastina 2011). Calcagnini, taking his cue from Erasmus's *De libero arbitrio*, argued against Luther's bondage of the will, starting a written correspondence with Erasmus of Rotterdam (whom he met in 1508 when the latter spent a short time in Ferrara), who greatly appreciated Calcagnini's intervention, in which Reformist

doctrines were labelled as “Lutheranum ulcus” and Luther himself was described as a ferocious boar laying waste to the Lord’s vineyard (Calcagnini 1973). Calcagnini openly referenced Erasmus – who argued against the Lutheran doctrine of predestination and advocated free will by drawing on the holy scriptures – and underlined that the issue of free will had been long debated by ancient, non-Christian authors, cataloguing the opinions, both in favor of and against it, of Greek philosophers like Democritus, the Stoics, Epicurus, Carneades, Plato, and even Aristotle, whose thinking on the matter remains unclear. After refuting the claim that human freedom doesn’t exist, because of divine omniscience, Calcagnini sided with Cicero in stating that freedom is rationally necessary to acknowledge virtue, reward, and punishment, thus welding together the philosophers’ elevated words with the holy scriptures. Calcagnini may have met John Calvin during the visit the latter made to Ferrara in 1536. It is to Calcagnini himself, a protonotary apostolic prelate, that Calvin is probably referring in a famous passage of his *Excuse à Messieur les Nicodémistes* against Nicodemite courtiers, defined as “prothonotaires delicatz” (Ginzburg 1970).

Callistos, Andronicos

Born: Thessaloniki, ca. 1400

Died: London 1486

Georgios Arabatzis

Department of Philosophy, Pedagogy and Psychology, National and Kapodistrian University of Athens, Athens, Greece

Abstract

Andronicos Callistos was a Byzantine philosopher and scholar who, after the fall of Constantinople, moved to Italy to teach the Greek language. He later left for Paris, where he was instrumental in the growth of Greek studies, and London. He took part in the controversy between Platonists and Aristotelians that divided Byzantine émigrés in Italy. As an Aristotelian, he defended Theodoros Gazes against the accusations of the Platonist Michael Apostolis.

Biography

Andronicos Callistos was a Greek philosopher and scholar and the cousin of the philosopher and scholar Theodoros Gazes (ca. 1398–ca. 1475). Like Gazes, he took part in the controversy between Platonists and Aristotelians that was initiated by Plethon’s treatise *De differentiis Platonis et Aristotelis* (*On the Differences between Plato and Aristotle*) and occupied the Byzantine philosophers-émigrés of the Renaissance like Basilios Bessarion, Georgios Trapezountios, and Michael Apostolis. Andronicos belonged to the intellectual cycle of Bessarion who, though a student of Plethon, adopted a moderate stand in the dispute,

advocating a mild variant Platonism. After the fall of Constantinople, Andronicos sought refuge, like many other Byzantine intellectuals, in Italy and taught Greek in various Italian cities like Bologna, Rome, Florence, and later in Paris and London where he spent the rest of his life. In Paris he became a renowned professor and scholar and purveyor of Greek learning (see Cammelli 1942). Callistos had a profound knowledge of Aristotelian philosophy and translated Aristotle's *On generation and Corruption* into Latin (on Callistos' erudition see Centanni 1984/1985; Günther 1999; Powell 1938). When Michael Apostolis criticized Gazes' defense of Aristotle against Plethon's Platonist condemnation of the Stagirite, Andronicos wrote a scathing refutation of Apostolis's treatise (see Callistos 1967; Monfasani 1985). Callistos refuted the accusations made by Apostolis against Gazes that he was a compiler, an allegation that for Apostolis concerned also the Latins of the time. Callistos defended the Latins and Latin philosophy and referred to the work of Cicero as an example of philosophical excellence in the West. Callistos insisted that the Latins possessed scientific accuracy, in addition to a genuine philosophical spirit, and he criticized Apostolis's comparison of the Greeks with the Latins as a form of essentialism.

Calvin, Jean

Born: 10 July 1509; Noyon, France

Died: 27 May 1564; Geneva, Switzerland

Michael A. Hakkenberg
Roanoke College, Salem, VA, USA

Abstract

Provides an overview of the life, work, and impact of John Calvin, the sixteenth-century Protestant reformer. Calvin spent his early life in France, but his career as a reformer focused on the city of Geneva. Calvin's most influential

work was the *Institutes*, and under his leadership Geneva became the center of an international Protestant movement.

Biography

Born in Noyon, France, John Calvin was a central figure of the sixteenth-century Protestant Reformation. At a young age, Calvin left Noyon for theological studies at Paris, but – in part due to the influence of his father – Calvin moved from Paris to pursue the study of law at Orléans. During this period Calvin came into contact with the new learning of the French humanist movement and gained an appreciation for historical and literary studies, as well as the study of biblical and classical languages. In fact, Calvin's first work was a Latin commentary on Seneca's *De Clementia* (1532). By the early 1530s, Calvin had also become acquainted with a group that supported reform of the church, and many of them were familiar with the writings of both Erasmus and Luther. In 1533 Calvin got tied up in the Cop Affair – in which Nicholas Cop, the new rector of the University of Paris, gave an address which was sympathetic to the reforms of the humanists and the new Protestant movement. Both Cop and Calvin were forced to flee Paris, and Calvin moved to Basel, where in 1536 he published his first edition of the *Institutes* – one of the most important works of the Protestant Reformation. Later in 1536 Calvin ended up in Geneva where William Farel implored Calvin to stay and assist in the reform of the church. Both Farel and Calvin came into immediate conflict with the city magistrates – primarily over the degree of control, the magistrates should exercise over the church – and in 1538 Calvin and Farel were forced out of Geneva. Calvin then spent 3 years (1538–1541) in Strasbourg where he married and served as pastor for a French exile congregation; at this time he also came under the influence of the German reformer, Martin Bucer, and published an expanded French edition of his *Institutes*. In 1541, with the Reformation in

jeopardy in Geneva, Calvin was called back to the city; almost immediately upon his return, he produced the *Ecclesiastical Ordinances*, a model plan for the organization and governance of the church. Calvin then remained in Geneva, engaged in the work of reform, until his death in 1564. It was only later in life that Calvin's conflicts with the city magistrates and leading families of Geneva diminished.

Impact and Themes

Calvin's impact on the sixteenth-century Reformation cannot be underestimated: his summary and exposition of the new Reformed religion contained in the *Institutes* remains extremely influential. In the *Institutes* one finds the dominant themes of Calvin's theology: the sovereignty of God, salvation as a divine gift, the authority of Scripture, and the importance of sanctification. Calvin also preached regularly in Geneva, wrote commentaries on almost every book of the Bible, carried on an extensive correspondence with Protestant leaders throughout Europe, and engaged in polemical exchange with both his Catholic and Protestant (Lutheran and Anabaptist) opponents. Calvin argued for a church polity in which the church was independent of state or magisterial control – although he never fully achieved the kind of independence for the church in Geneva that he wanted. For Calvin the true church was distinguished by the right preaching of the word and the correct administration of the sacraments, and Calvin promoted a simple style of worship. Geneva also became a center of the international Protestant movement under Calvin – many refugees came to Geneva in the 1540s and 1550s, and Geneva served as a training center for Protestant ministers in the middle and later decades of the sixteenth century. Calvin placed a strong emphasis on the need for a disciplined Christian life and created the consistory (composed of ministers and elders) whose role it was to engage in the moral oversight of the Genevan community. Finally, Calvin developed

at least the foundation for a theory of resistance and revolt that would turn out to be an important force within European politics in the sixteenth century and beyond.

Calvinism

Michael A. Hakkenberg
Roanoke College, Salem, VA, USA

Abstract

Named after John Calvin and centered in Geneva, Calvinism became an international movement of the Protestant Reformation in the sixteenth century. Calvinism developed into a theological system – with an emphasis on the sovereignty of God – and an active movement for reform of the church and society.

Impact and Legacy

Calvinism refers to the theological system and reform movement that developed under the leadership of John Calvin in the middle decades of the sixteenth century. Calvin grew up in a Catholic family, but by the early 1530s, he had begun to associate himself with the Protestant reform movement in France; forced to leave his native country because of his association with Protestantism, he spent most of his life in the Swiss city of Geneva (1536–1538; 1541–1564), where

he remained until his death in 1564. Under Calvin's influence, Geneva became the center of an international Calvinist, or Reformed, movement. Much of Calvin's theological system is contained in his *Institutes of the Christian Religion* which he first published in 1536 but continued to revise and expand until the final edition in 1559. Calvin was trained as a lawyer and shaped by the Renaissance humanist movement in France – and both of these influences are present in the *Institutes*.

Calvin's theology – and thus much of later Calvinism as well – was characterized by a strong emphasis on the corrupting power of sin and human depravity and hence the need for grace and the gift of divine salvation. It was in this context that Calvin developed his now famous doctrine of predestination, including both election and reprobation. God is active in the universe and ultimately nothing happens apart from God's will. Calvin also described faith as a true knowledge of God, characterized by obedience to the will of God. Other theological emphases in Calvinism include the sovereignty and providence of God, the absolute authority of Scripture, the centrality of preaching, and the importance of sanctification as an ongoing process. Calvin stressed the need for a biblical piety and for an active and disciplined life lived in service to God. Calvin also strongly opposed the Catholic doctrine of transubstantiation, rejected the Mass as a sacrifice, and repudiated the concept of papal authority over the church. The doctrine of the covenant also became a dominant feature of later Calvinism.

Much of the influence of Calvin came through the establishment of Geneva as a center of international Calvinism in the sixteenth century. Many Protestant refugees came to Geneva where they were influenced by Calvin's preaching and teaching, and the Genevan Academy, established in 1559, served as a center for the training of Protestant ministers – who then took Calvin's ideas to other parts of Europe. Geneva became a publishing and printing center for the

international Calvinist movement, and certain universities, such as Heidelberg and Leiden, also became known as Reformed centers of learning. Calvinism distinguished itself by its church polity which emphasized the need for an independent church governance free from the influence of the civil magistrate. The role of the magistrate was to support true religion but not to interfere in the internal organization of the church. Calvinism came to be characterized by its emphasis on the four offices of the church (teacher, minister, elder, and deacon) and by the role of the consistory (ministers and elders) in providing religious and moral oversight of the Christian community.

Calvinism also proved influential in the social and political realms. Calvin placed a strong emphasis on work and vocation, and a disciplined moral life became a feature of Calvinist piety. Social welfare or poor relief also became an important characteristic of Calvinist communities. Calvinism made significant contributions to political theory as well with its emphasis on the right and duty of armed resistance and revolt against unjust or tyrannical rulers. In this context Calvinism became associated with resistance to Catholic rule in France, the Low Countries, and Scotland, and it encouraged perseverance in the faith even in times of extreme persecution. Calvinism also supported an activism in politics and at least in certain contexts a republican form of government – which set it apart from the Lutheran political tradition and Lutheran attitudes toward civil authority. By the 1560s Calvinism had extended its influence throughout much of Europe, and this influence would expand, through the Puritans, across the Atlantic as well.

Camariotes, Matthaïos

Born: Thessaloniki Early Fifteenth Century

Died: Constantinople 1490

Sotiris Fournaros^{1,2} and Ioanna Tripoula²

¹University of Athens, Athens, Greece

²Department of Philosophy, School of Philosophy, Panepistimiopolis/National and Kapodistrian University of Athens, Zografou, Greece

Abstract

He was a Greek scholar, who lived in the fifteenth century. He was heavily influenced by Gennadios Scholarios' views and he fervently attacked Georgios Gemistos Plethon.

Alternate Names

[Kamariotis](#); [Matthaïos](#)

Biography

His family originated in Thessaloniki and lived in Constantinople. His father was a priest. He initially studied with Gennadios Scholarios. Afterward, he studied grammar, rhetoric, philosophy, and theology, and he had some knowledge of mathematics, geometry, and mathematical astronomy. His extensive humanistic education made him a well-known scholar and led him to teaching, copying manuscripts, and writing original treatises. His remarkable activity as a teacher led some scholars to hold that he was the first Director of the Patriarchal Academy after the Fall of Constantinople, although such a claim is not documented.

After the Fall of Constantinople, his family broke up, his father and his brother were lost, and he was captured. Later he managed to be liberated and reunited with his mother, sister,

Sotiris Fournaros: deceased.

and one of his nephews. In the following years, his traces are lost. He is believed to have lived for some time in Thessaloniki and later spent some years in Constantinople. He died in the winter of 1490.

Innovative and Original Aspects

Camariotes belongs to the scholars who criticized the so-called “first neo-Hellene” Philosophers, as Plethon (or Georgios Gemistos, c. 1360–1454). In *Rhetorikes Epitomi ek ton tou Ermogenous (Compendium of Rhetoric from Hermogenes)* Camariotes leans on the Greek rhetorician’s, Hermogenes of Tarsus’ (second century) *Peri Staseon (On Legal Issues)*, while he invokes Aristotle, and especially his *Rhetoric*, for all the important definitions, discriminations, and clarifications regarding the art of discourse. Camariotes disputed Plethon’s *Peri Eimarmenis (On fate)* with his *Logoi duo pros Plethona peri eimarmenis (Two Discourses on Plenthon’s on Fate)*. He stood aside with Gennadios – Scholarios in the anti-platonic movement, especially by reinstating the Christian God and setting aside anti-Christian notions.

Other treatises focused on rhetoric: *Peri ton Stoicheion tou Logou (On the Discourse’s Elements)*, *Epitomi eis ta tes Rhetorikes Progyrnasmata (Compendium on Rhetoric’s Preparation)*, and *Synoptiki Paradosse tes Rhetorikes (Concise Tutorial of Rhetoric)*. Strictly philosophical are the *Logoi duo pros Plethona peri eimarmenis (Two Discourses on Plenthon’s on Fate)*, and the *Exegesis eis tas Epistolas Synesiou (Exegesis in Synesius Epistles)*. Religious insights characterize the *Egomion eis tous Treis Ierarches (Praise for the Three Hierarchs)* and *Exegesis tou Symvolou tes Pisteos (Exegesis in Credo)*. Moreover, Camariotes has written *Stichoi Iamvikoi (Iambic Verses)* and *Epistoles (Epistles)*.

Impact and Legacy

Camariotes defended the Ecumenical Patriarch’s, Gennadius Scholarius’, philosophical and

religious views. He took active part in the debate between Platonists and Aristotelianists defending the Aristotelian philosophy.

Camillo Delminio, Giulio

Born: 1480

Died: 15 May 1544

Javier Patino Loira

University of California, Los Angeles, CA, USA

Abstract

Giulio Camillo was a poet and a scholar active in the first half of the sixteenth century. Involved against Erasmus of Rotterdam in the controversies concerning *imitatio*, he sided with those who advocated Cicero as the only model of language for Latin prose. Camillo made himself a reputation as the proponent of a method for inventing tropes based on the topics of argumentation. He became even more well-known as the designer of a theater that organized the entirety of what

there is to be known according to a syncretic model that harmonized Christian, Neoplatonic, Hermetic, and Kabbalistic ideas, and that provided users with a repository of language enabling them to express any aspect of reality with single words and phrases gathered from the writings of classic poets and orators.

Biography

Giulio Camillo was born in Friuli, Italy, around 1480 (Stabile 1974). He adopted the toponymic Delminio from a city in Dalmatia that was supposedly his father's hometown (Camillo 1560). As a young man Camillo lived in Venice for some time or at least made frequent visits to the city, and was probably there during Erasmus's sojourn with Aldus Manutius and Andrea Torresani between 1506 and 1509, for Erasmus confessed to have once shared a bed with him (Stabile 1974). It also was in Venice that Camillo met his lifelong friend, Girolamo Muzio, to whom we owe the most detailed accounts of Camillo's intellectual career (Muzio 1590; Neri 1884; for more information on the young Camillo, although not always reliable, see Liruti 1780).

No records confirm that Camillo ever completed a university degree. In any case, his earliest extant works point to his eclectic interests, including Petrarchism, Aristotelian and Neoplatonic philosophy, Hermeticism, and Kabbalah. Letters from the period from 1521 to 1525 place Camillo between Bologna and Padua, from where he communicated with a network of renowned scholars, writers, and artists. Titian painted a now-lost portrait of him (Vasoli 1984), and in 1528, Camillo appeared as the universal heir in the will of architect Sebastiano Serlio (Olivato 1979). Camillo also corresponded with Pietro Aretino and Marcantonio Flaminio and was mentioned in proximity to painter Lorenzo Lotto and future exile Alessandro Citolini (Stabile 1974; Vasoli 1975). In a period of increasing mistrust and surveillance of religious affairs, some of Camillo's acquaintances to varying degrees played the game of heterodoxy, and soon enough he was

compelled to gather proof of his adherence to established dogma in order to defend himself from accusations (Camillo 2015b).

In terms of reputation, Camillo's contemporaries considered him to be on a par with the personalities mentioned above. He aroused equal portions of veneration and scorn as the creator of a device that he called "a theater," which he intended to avail to anyone seeking to dissert eloquently about any topic whatsoever. According to Sebastiano Fausto da Longiano, Camillo conceived of and "finished" the theater in the summer of 1525 at Sebastiano Sauli's villa near Genoa (Bolzoni 2015). Thereafter, Camillo peregrinated from court to court in search of patrons who might take interest his project, and in 1530, Camillo seized the opportunity to join Muzio in the retinue of Count Claudio Rangoni, bound for France. King Francis I had learnt from Camillo's project, perhaps through Lazare de Baïf and Jean de Langeac, his ambassadors in Venice (Stabile 1974). At court in Fontainebleau, the king agreed to try Camillo's method. He perused the device for some time, after which Camillo tested the progress accomplished by the king. The results were satisfactory, and Francis I paid Camillo a generous sum with the condition that he complete the theater, and not communicate about it with anyone else (Neri 1884).

Beginning in 1530, Camillo wandered through different cities in France and Italy. In the retinue of Cardinal Jean de Lorraine, he saw Paul III elected pope in Rome in 1534 (Neri 1884). Despite arousing admiration among many, Camillo faced criticism from Paolo Giovio and Étienne Dolet, among others, and Andrea Alciato expressed concern that Camillo's deal with the king might be a scam (Stabile 1974; Christie 1899). Erasmus was particularly tenacious in his inquiries about Camillo's true allegiance. Wrongly persuaded that the latter was the real author of Giulio Cesare Scaligero's reply to his dialogue *Ciceronianus* (1528), Erasmus sent his friend Viglio Zwichem to Venice on a mission to clarify the issue (Bolzoni 1993). In a letter to Erasmus dated June 1532 that remains the sole surviving eyewitness account of Camillo's wooden amphitheater, Viglio described both the building and the man,

halfway between fascination and disdain (Yates 1974; Bolzoni 2015).

Most of Camillo's works can be considered to be partial descriptions of his project. Although he protested that writing about the theater risked the disclosure of the secrets of his method, Camillo escaped contradiction by pretending that his revelations were much-needed responses to adversaries who depicted him as a fraudster. Early in 1534, Camillo circulated his speech *Pro suo de eloquentia theatro ad Gallos oratio* in France, and in Italy, he dedicated *Discorso in materia del suo theatro* to Trifon Gabriele. In *L'idea dell'eloquenza*, Camillo sketched a plan for seven orations devoted to the orderly exposure of his project. This included *Dell'imitazione*, which was partially a response to Erasmus's *Ciceronianus*, and *Delle materie*, which he dedicated to Duke Ercole II of Ferrara when support from Francis I seemed to falter.

For the rest of his life, Camillo never stopped traveling. As late as 1542, Jean Calvin's letters place him in Geneva (Stabile 1974), and in 1543, he returned to Italy, convinced that he would never go back to France. Muzio's protector, the governor of Milan Alfonso D'Avalos, expressed curiosity in Camillo's secrets. Neither age nor disillusionment prevented him from hosting yet another demonstration to a prospective patron. In the presence of D'Avalos, Camillo disserted as if in rapture throughout a series of meetings that culminated in the governor's declaration, "True or false, I want it," which epitomized the blend of wonderment and skepticism that Camillo's project aroused everywhere. Before departing for war in Piedmont, D'Avalos asked Camillo to lay out his project in writing. As Muzio recalls, with him as scribe, the two friends completed the manuscript of *L'idea del theatro* "in seven mornings" (Muzio 1590; Neri 1884). Soon after, on May 15, 1544, Camillo died at Domenico Sauli's home in Milan.

Heritage and Rupture with the Tradition

Camillo's approach to rhetoric centered on the notion of imitation, which he argued had two sides that required separate consideration (Camillo 1970–74a). On the one hand, imitation

implies adherence to the conventional use of words that is common to speakers in a given time and place. Camillo described the realm of convention as something public, meaning that if someone were to say or write exactly the same utterance as someone else, then he or she would not be stealing, because notions such as creation and ownership are meaningless there. Quite differently, artifice is a field delimited by the ways in which particular speakers depart from conventional use by creating forms that, if repeated verbatim, would constitute theft. This is what happens, for instance, with tropes and figures.

Regarding convention and the use of Latin, Camillo sided with strict Ciceronians such as Pietro Bembo by declaring Cicero's writings to be the sole model for prose. In Erasmus's eyes, the absence of native speakers of Latin implied that sixteenth-century speakers should imitate the language of the ancients by selecting the best words from the books of the best authors of antiquity. However, for Camillo the eclecticism proposed by Erasmus was something that foreign speakers of a language could simply not afford in good conscience, for it required the kind of judgment that makes it possible to discern whether particular forms are better or worse, in order to critically choose and reject from what a multiplicity of writers have left in their works. This was a task for which only native speakers might lay legitimate claim, and therefore it had to be abandoned. If that rationale were not enough, then Camillo added that eclecticism begets monsters, for it results in a mixture of words from different periods that produces creatures that no one ever spoke at any time of history and that therefore cannot be assigned to any period. At the same time, Camillo justified his advocacy of Cicero as the model of Latin prose to the detriment of other authors by resorting to the notion popularized two decades earlier by Adriano Castellesi that language is a living being (Monfasani 1999). Languages are born, mature, decay, and eventually die. For Camillo, Cicero's era, and Cicero himself in particular, marked the perfection of Latin's existence. From that standpoint, it was easy to conclude that only his writings should be imitated as far as the use of the language is concerned.

Imitation works differently in the case of tropes and figures. Camillo warned that, in contrast to what happens to words in their usual meaning, if we were to reuse one of Vergil's metaphors or Cicero's periphrastic turns without altering them, then we would be guilty of theft. As he explained, because the notions of creation and ownership are relevant in the realm of artifice, the imitation of tropes and figures requires variation in order to be permissible. Camillo proudly claimed to have devised a method to do this. Conceiving the imitation of artifice as a form of invention, he naturally adapted the theory of the topics to the tropes. Rhetoricians had used the topics to find arguments since the days of Aristotle and Cicero and recently Rudolf Agricola's *De inventione dialectica* had again rendered them fashionable. Tropes, after all, make arguments on the basis of a relationship, however elliptical the way in which they formulate it may be (Camillo 1560, 1970–74a, 1970–74b). Camillo suggested that speakers should analyze the trope that they wish to imitate and identify by abstraction the topic upon which it is based. For instance, when Petrarch describes a sigh by saying that he breaks the air before his mouth, he argues in reference to the topic of consequence – that is, what necessarily follows. When the poet writes that he makes foliage tremble, however, he describes the same sigh according to the topic of adjuncts – that is, what may or may not occur subsequent to the action being described, “for it is not necessary that when we blow we make the things in front of us tremble, unless they are really close to us.” To imitate Petrarch's description of a sigh without incurring theft, Camillo's method prescribed that speakers identify other occurrences that necessarily or might follow the act of sighing. Acutely aware of the nuances of his method, Camillo warned that topics generally less valid for argumentation, including the adjuncts that lay no claim to necessity and argue only according to what is possible and contingent, show greater artifice when they serve the invention of tropes. In fact, those topics make the speaker's wit shine more brilliantly, for the audience recognizes the greater difficulty of using them and still formulate something that appears plausible (Camillo 1970–74b).

Innovative and Original Aspects

Camillo's aim at renewing the whole of rhetoric did not stop there. To assist poets and orators in disserting on any discipline whatsoever, he compiled a repository of concepts that listed single words and phrases (“locuzioni”), both Latin and Italian, used by classics such as Virgil, Cicero, and Petrarch to put any idea into language. What Camillo called his “anatomy” of the tradition provided users with “two forests, one of things and the other of words,” seeking to restore the link between wisdom and eloquence, which (according to him) Socrates had destroyed (Camillo 1567; Muzio 1590). The project started as a dictionary arranged in alphabetical order, but the method revealed itself useless for speakers who did not know the term for the concept that they sought to express. Accordingly, Camillo recast his project as a map of places, inspired in the tradition of the arts of memory. Refusing the kind of random associations between places and content characteristic of certain models, such as that of the parts of a building proposed by Cicero, Camillo eventually identified a pattern of motivated, “natural” places in the microcosm of the human body (Camillo 1560, 2015b). Should anyone wish to speak of visual perception, they would find right in the part of the map corresponding to the eye a drawer with a piece of paper containing single words and phrases used by Virgil or Petrarch to speak about sight.

At some point, Camillo replaced the human body with a theater, or amphitheater, that would display “in spectacle” the entirety of what is knowable. Camillo's device served as a mind outside the mind that made knowledge visible (Camillo 1587). By providing a map of symbols able to embody even concepts that only the intellect can grasp, the theater could help anyone to understand the order of the universe, but also to speak eloquently about any part or aspect of it thanks to the repository of language that was associated with each symbol. As in ancient theaters, where spectators sat in definite, distinct places according to rank, the stands of Camillo's theater of memory mirrored the hierarchy of being (Camillo 2015a). However, Camillo's theater

radically transformed the criteria for segmenting, ordering, and visualizing reality. Instead of the more or less transparent relations symbolized by the parts of the body, spectators faced now a more complicated order of things that harmonized Christian and Neoplatonic principles with Hermeticism and especially Kabbalah, a discipline that Francesco Zorzi may have taught Camillo in Venice (Secret 1959; Bologna 2002). In a letter to D'Avalos, Muzio depicted this bend in Camillo's trajectory with dramatic overtones, as a neglect of the study of Petrarch and Virgil's artifice in the expression of feeling for the study of the secrets of nature and God (Muzio 1590). Camillo's new interests led him to a syncretism that suited the intellectual climate of the first third of the sixteenth century and which had a famous precedent in Giovanni Pico della Mirandola. In fact, contemporaneously with Camillo's theater, Pope Clement VII commissioned a work such as Giles of Viterbo's *Scechina*, which epitomized a model of learned and eclectic Catholicism that would become suspect, and eventually obscured in the decades that followed (O'Malley 1968; Wilkinson 2007; for Camillo's involvement with Kabbalistic hermeneutics, see Vasoli 1984).

From the stage of Camillo's theater, the user could contemplate in the stands a grid of 49 places resulting from the intersection of seven vertical and seven horizontal ranks. The former corresponded to the seven columns of the temple of Solomon, also alluding to seven planets, seven angels, and seven sephirot or emanations in which, according to Kabbalah, God's creative power unfolds in both the physical and metaphysical realms (Scholem 1965; Bolzoni 2011). The theater represented the natural and celestial world. God's inner mind, unknowable to us (and to which the three remaining sephirot of Kabbalah correspond), remains out of scope (Camillo 2015a; Bolzoni 2011). Seven degrees cut the seven columns horizontally. They reproduce Creation, the passage from unity to multiplicity that mirrors, according to Camillo, the work performed by any of the arts, from sculpture to painting to poetry, as they transition from the idea of perfection to the making of each individual artifact (Camillo 2015a, b). Conversely, only by

the movement of abstraction to simpler beings, Camillo wrote, is it possible for the mind to understand particular creatures and events, much in the same way that one may see the forest only from above.

In Camillo's theater, the intersection of vertical and horizontal ranks creates meaning, according to a principle that was familiar to contemporary works influenced by Raymond Lull (Rossi 1960; Bolzoni 2015; see Bolzoni 1984 for the relation between Camillo and sixteenth-century Lullism). It is precisely at the intersections that we find the places through which memory and invention find a path to move across the map of what is knowable. The places are denoted by painted or sculpted images, symbols that point to God's secrets while keeping them concealed, and which, much like metaphors, enable language to express concepts that otherwise remain unspeakable (Camillo 2015a).

As a window to the world, Camillo's theater was a tool for interpreting poetry, which Camillo considered a sort of *prisca philosophia*, or primeval philosophy, in which God's secrets are expressed through "obscure veils" (Camillo 2015a; see Zaja 1994, 1995). Contemporaries recalled witnessing Camillo offer ten different elucidations of one of Petrarch's sonnets (Pietrobon 2015). The theater made this possible because it allegedly embodied the same philosophy with which poets were familiar when they encrypted the secrets of God and nature in their poems (Camillo 2015b). The theater served for purposes of interpretation and creation alike. In fact, it guided the invention of the poet by providing "matter, artifice, and language." Each place was a repository of single words and phrases legible in pieces of paper contained in drawers or hanging from the wall for the spectator to unroll (Bologna 2002). One could find expressions in several languages, meaning that the theater also functioned as a machine for translation (Muzio 1590; Camillo 2015b). Camillo considered eloquence to be a modality of transformation that allows man to become God-like and do with words what alchemy does with matter. The theater provided its users with a tool to do that (Vasoli 1984; Camillo 2015c).

Impact and Legacy

Camillo's influence was remarkable. In 1560, Giovan Mario Verdizzoti and Francesco Patrizi hailed the use of the topics for the invention of tropes as revolutionary. It served as the basis of Bernardino Partenio's *Dell'imitazione poetica* and received praise in Francesco Robortello's *De artificio dicendi* (1560) and Torquato Tasso's *La cavaletta* (1587). Patrizi used Camillo's method in his commentary of Luca Contile's sonnets (1560) and praised it as late as 1587 in his *Deca plastica*. Camillo's terminology pervaded fields as varied as translation studies and literary criticism, respectively exemplified by the works of Fausto da Longiano and by Pompeo Garigliano's commentaries on Giovanni della Casa's sonnets. In 1643, Giuseppe degli Aromatari considered Camillo's theory of the topics still relevant, and reprinted it in his anthology of grammatical and rhetorical writings almost one century after Camillo's death. The impact of Camillo's theater was no less remarkable. The publication of his works only increased the desire to find traces of the building itself, which a series of scholars and artists aspired unsuccessfully to retrieve. Many of the symbols described for the places of the theater reappeared in works such as Achille Bocchi's *Symbolicae quaestiones* and in posthumously augmented editions of Pierio Valeriano's *Hieroglyphica*. Camillo's works fascinated Anton Francesco Doni and provided iconographic programs for cycles of frescoes painted by artists as important as Correggio, which is unsurprising, given that Titian had famously illustrated a copy of *L'idea del teatro* dedicated to Diego Hurtado de Mendoza (Bologna 2002; Bolzoni 2015). Insofar as Camillo's theater was to a great extent also a library, it might be said to have foreshadowed sixteenth-century projects that aimed to transform the order of book collections into visualizations of the encyclopedia, or the connectedness of knowledge, such as the one that Federico Badoer's Venetian *Academy of Fame* planned for the Biblioteca Marciana (Bolzoni 1995, 2015). It also furnished a structure for Samuel Quiccheberg 1565 "theater," a pioneering text on art collection and museums, as well as to Giovanni Paolo

Lomazzo's 1590 "temple" of painting. Camillo's attempt at mapping the inventory of Creation descending from the unity of God to the multiplicity of things that exist in the world appeared excessively ambitious to his admirer Patrizi in 1562. However, this did not prevent others from following on his steps, and it probably stimulated encyclopedic repertoires such as Alessandro Citolini's 1561 *La Tipocosmia* (Bolzoni 2015).

Campanella, Tommaso

Born: 5 September 1568, Stilo, Calabria/Italy

Died: 21 May 1639, Paris/France

Jean-Paul De Lucca

Department of Philosophy, University of Malta, Msida, Malta

Abstract

Tommaso Campanella was one of the foremost Italian philosophers of the late Renaissance. Known mostly today for his famous utopia, *The City of the Sun* (*La Città del Sole/Civitas Solis*), his many writings cover a range of subjects, including natural philosophy, ethics, politics, theology, metaphysics, epistemology, magic, astrology, medicine, education, rhetoric, historiography, and mathematics.

Despite its apparent fragmentary structure, his overall project sought to establish an encyclopedia of knowledge that could serve as a basis for the reform of the sciences. This, in turn, was to lay the foundations for his project of universal political and religious reform and reconciliation. He is also known as a philosophical poet and his extant epistolary corpus includes some 170 letters. Most of his works were written during his almost 30-year long imprisonment in Naples and Rome. A self-described but often heterodox Thomist, Campanella was also among the staunchest critics of Aristotelianism and Machiavellism, and one of the most notable defenders of Galileo.

Biography

Campanella was born on 5 September 1568 in the town of Stilo, on the eastern coast of Calabria. He changed his baptismal name, Giovanni Domenico, to Tommaso, in honor of Thomas Aquinas, upon joining the Order of Preachers (Dominicans).

As a child, Campanella received a very rudimentary education that included some lessons in grammar and catechism. Seeing his promising intellect, his parents planned to send him to Naples to be tutored by his paternal uncle, a young lawyer whose footsteps their son could follow. However, Giovanni Domenico opted instead to join the Dominicans after being introduced to logic and becoming fascinated by the figures of Albert the Great and Thomas Aquinas (Longo 2003). Years later, recalling that his own education had left much to be desired, Campanella would advocate access to free education for children of all social backgrounds.

After taking vows, Campanella studied philosophy and theology at the Dominican houses of study in San Giorgio Morgeto and Nicastro. He soon grew dissatisfied with the *studium's* exclusive, rigid Aristotelianism, which was compounded by his teachers' inability to respond to the questions he kept asking. As he explored other intellectual avenues, the author who most impressed him was the naturalist philosopher

Bernardino Telesio (1509–1588). Neither the young friar's sharp intellect nor his restlessness went unobserved. He was moved to Cosenza, his Order's headquarters in Calabria, to conclude his theological studies. Here he had hoped to meet Telesio, only to learn of his demise soon after reaching the city. The internal struggles and intellectual aridity that the Dominican province was experiencing at the time seem to have led Campanella to consider leaving the Order, but instead he left Cosenza and settled in Naples. In the Kingdom's bustling capital, he befriended several scholars, including Giambattista della Porta (1535–1615), and was employed as the private tutor in the household of nobleman Mario del Tufo, to whom Campanella dedicated his first major work, *Philosophia sensibus demonstrata* (1591). It was also in Naples that he became acquainted with esoteric magic.

The *Philosophia sensibus demonstrata* presented a strong defense of Telesio's natural philosophy. This led to the first proceedings, within the Order, against Campanella on strong suspicion of heresy. The outcome was a relatively mild censure and the injunction to uphold Thomistic doctrine and renounce the teachings of Telesio. He was also ordered to return to Calabria at once, but instead the philosopher moved in the exact opposite direction, heading north towards Florence with a short stop planned in Rome in order to clear his name. In Florence, he had hoped to be given a Chair in either Pisa or Siena so that he would be able to enjoy the intellectual freedom his homeland could never have afforded him. Although Grand Duke Ferdinand I of Tuscany received him courteously, an ambiguous reference he had managed to obtain in Rome from Cardinal Francesco Maria del Monte did little to help him reach his goal. His potential patrons were suspicious of his adherence to Telesio's teachings, whose *De rerum natura* the Roman Inquisition was about to place on the Index of Prohibited Books. During a brief stay in Bologna, the Holy Office there confiscated all his manuscripts, which included titles such as *De investigatione rerum*, *De sensu rerum*, *De philosophia Empedoclis*, *De philosophia Pithagoreorum*, and other works on

metaphysics and physiology. Some of these works would be lost forever.

In early 1593, Campanella moved to Padua, where he appears to have enrolled as a student of medicine under a pseudonym. Here he also met a young Galileo Galilei, with whom he would remain in correspondence in the decades that followed. During the 1616 proceedings against the astronomer, Campanella would write the *Apologia pro Galileo* at the request of Cardinal Caetani (a member of the commission of qualifiers who supported Galileo). The *Apologia* was eventually published in Frankfurt, in 1622. Although in disagreement with several of his assertions, in the *Apologia* Campanella affirmed Galileo's right to intellectual freedom (*libertas philosophandi*). The yearlong sojourn in Padua was an especially prolific one for Campanella, who composed now-lost treatises such as *De regimine Ecclesiae* and *De monarchia Christianorum*. Towards the end of that year, or early in 1594, Campanella was arrested in Padua at the behest of the Venetian Holy Office. The charges brought against him accused him, among other things, of adhering to Democritean materialism, of being in possession of a book on geomancy, and of entertaining conversations with a relapsed Jew. The philosopher was tortured before a decision was taken to transfer the trial to Rome, where he was imprisoned in October 1594 and tortured again in April of the following year. He was eventually condemned of strong suspicion of heresy (*de vehementi*), ordered to make a public abjuration at Santa Maria sopra Minerva, and confined to the Dominican convent of Santa Sabina in Rome until December 1596 (Firpo 1998; Spruit 2000). Campanella wrote several works during this period of house arrest, including the *Dialogo politico contro Luterani, Calvinisti e altri eretici*, which had the twofold aim of exposing the theological errors of Protestantism and highlighting the political value of unity among Christians. These themes remained central to his thought and writings for the rest of his life.

Campanella remained under a cloud of suspicion when he moved to the convent of Santa Maria sopra Minerva. Although subjected to

further investigations, he was not found guilty of heresy. However, in May 1597, the Holy Office placed his books on the Index of Prohibited Books and instructed his superiors to send him to a convent where he would not be of danger or scandal. He was thus ordered to return to his native Calabria, where he soon became embroiled in juridical disputes between ecclesiastical and civil authorities. His defense of bishops' prerogatives, and his criticism of abuses perpetrated by officials of Spanish Kingdom of Naples, earned him the latter's scorn.

On 10 August 1599, the Spanish authorities received a report that Campanella, "who is held throughout the world to be a leader in the sciences" (Ernst 2010, 67), together with several prelates and noblemen conspired to organize a revolt in Stilo against the Spanish Crown. The exact nature and extent of his material role in the conspiracy remains contested in the scholarship, but there can be little doubt about the impact of his preaching about a new golden age of natural freedom and social change, which was prefigured by astral motions and natural phenomena. Campanella was arrested on 6 September 1599 and transferred to Naples to face capital trial for lèse-majesté. A protracted process which saw the intervention of the Pope himself resulted in the setting up of a joint tribunal to deal with charges of both high treason and heresy. After being subjected to torture and confined awaiting trial, Campanella started writing two series of defense submissions, the second of which would later be elaborated as the *Articuli prophetales*. However, seeing the ill disposition of his judges, he soon stopped writing and opted for a more drastic course of action. On Easter Sunday of 1600, he set fire to the mattress he lay on, thus beginning a simulation of insanity that would last for almost two years. He was enjoined to stop feigning madness as he was tortured several times, but he persisted even when subjected to the most terrible form of torture, the thirty-six-hour *veglia* during which he was hung from the wrists while seated, legs open, on a splintered horse-like device. Judges were left with no choice but to declare his insanity and were thus unable to order his execution. Instead, the

philosopher was sentenced to life imprisonment (Ernst 2018).

Campanella's forced confinement spanned almost three decades, during which he wrote and rewrote most of his works on natural philosophy, metaphysics, theology, ethics, politics, prophecy, astrology medicine, and magic, as well as many poems and letters. Soon after recovering from the ordeal of his trial, in 1602, he started writing *La Città del Sole* (*The City of the Sun*), the utopia for which he became most known. Simultaneously he began working on a political treatise that would eventually be published as the fourth part of *Philosophia rationalis*, entitled *Politica* (Frankfurt, 1623; Paris, 1637). It is significant and relevant to a proper interpretation of Campanella's political thought that, during his lifetime, *The City of the Sun* was published twice, in Latin as *Civitas Solis*, as an appendix to this political treatise. Unlike his more contingent political writings, the *Politica* discusses the foundations of politics and offers a realist analysis of different forms of government. *The City of the Sun*, then, describes an idealized form of society through the dialogue between a Genoese sea captain and a Grand Master of the Hospitaller Order of the Knights of Malta (De Lucca 2009).

During his long captivity, Campanella worked on the *Metaphysica*, a treatise consisting of 18 books which begin with a confutation of skepticism (Paganini 2009) and proceed with an elaboration of his notion of Being incorporating the three metaphysical primalities (*primalitates*) of power, wisdom, and love. This work would only see the light of day in Paris, in 1638. He also composed a monumental *Theologia* in 29 volumes, which were never published during his lifetime. Other important theological-political works written during this period include the work described as being that closest to his heart (Ernst 2016), *L'Ateismo trionfato*, which he would publish after much trouble in Rome in 1630/1 and later in Paris in 1636, in Latin as *Atheismus triumphatus*. In this treatise, Campanella advances his views on religion being founded in natural law against Machiavelli's followers who conceived of religion as a tool subordinate to politics. He also

argues that Christianity was the positive (historical) religion that came closest to the universal, natural religion. Closely connected to this work is the *Reminiscentur*, a work of "practical theology" in which he addresses a series of legations to the rulers and religious leaders of all the world (Christians, pagans, Jews, and Muslims) (De Lucca 2017b). Their twofold purpose was to argue in reason for the primacy of a reformed Christianity and to call for the establishment of "a general council on the true faith" to which the all religions and denominations would be invited to participate. This work was also intended to serve as a guide for missionaries trained at the newly established Urban College of the Congregation for the Propagation of Faith, with which Campanella seems to have been indirectly involved.

In prison, Campanella also started writing a treatise on mathematics and another one on astronomy, as well as the *Medicinalium libri VII*, published later at Lyon in 1635. Other works on grammar, logic, rhetoric, poetics, and historiography were also written during the prison years and were eventually published in Paris, in 1638, as the five parts of *Philosophia rationalis*.

In May 1626, the Spanish Crown finally ordered the Neapolitan authorities to release Campanella. A month or so later, at the request of the Holy Office, he was transferred to Rome where he remained detained for almost three more years. He was finally freed of all charges towards the beginning of 1629 and on 2 June of that same year, in an apparent reversal of fortune, he was given the prestigious title of *magister theologiae* during the Dominicans' General Chapter. This unexpected promotion of a friar who had been repeatedly accused of heresy was a vindication for Campanella that would have limited and potentially reversed restrictions on his writings, but it also intensified the resolve of his opponents (especially within his Order) to discredit him.

Campanella's release and promotion were thought to have been supported by Pope Urban VIII. When rumors of impending astral movements heralding Urban's demise started circulating in 1628, the pontiff called upon the philosopher and reputed astrologer to perform

expurgatory rites in the apostolic palace (Walker 2000). When the philosopher's *Astrologicorum libri* (Lyon, 1629) was published, it included, unbeknown to him, the text containing the rituals he had performed with the pope. Campanella attributed this attempt to embarrass the pope and sow discord between them to an "insidious friar." The potentially disastrous effects of this astrological affair were eventually mitigated, and during his years in Rome Campanella dedicated his energy to the long-awaited publication of his works and to fostering new friendships. He interacted and corresponded with several influential French intellectuals and diplomats such as Gabriel Naudé, to whom he dictated several works, including an intellectual autobiography published posthumously as *Syntagma de libris propriis et recta ratione studendi* (Paris, 1642).

The resentful hostility of Campanella's rivals all but waned and this period of relative serenity came to an abrupt end when news reached Rome that his former disciple Tommaso Pignatelli, a fellow Calabrian Dominican, had been charged in Naples for conspiring against the Spanish Crown. Before his execution in October 1634, Pignatelli ostensibly mentioned Campanella, raising once again the specter of bygone years. On the night of 21 October 1634, Campanella hurried to the French embassy disguised as a Minim friar. With the assistance of the French Ambassador, de Noailles, he fled the city and headed for Paris via Lyon and Marseilles. Shortly after his arrival in Paris, he was received by King Louis XIII and Cardinal Richelieu, who took him under his protection, afforded him a pension, and engaged him as an adviser on Italian affairs. Although his antagonists in Rome instructed the Papal Nuncio in Paris to keep a watchful eye on him and thwart the publication of his works, Campanella was nonetheless able to revise his writings and begin publishing his projected *opera omnia* (which he never managed to complete). He also gained access to political and intellectual circles, including the networks of Mersenne, Gassendi, and Peiresc.

At the birth of the dauphin on 5 September 1638 (Campanella's 70th birthday), the author of *The City of the Sun* was summoned as the

astrologer tasked with charting the horoscope of the future "Sun King," Louis XIV. The poem he composed on that occasion, *Ecloga in portentosam Delphini nativitatem*, was to be his last written work. Campanella died at the break of dawn on 21 May 1639 at the convent of the reformed Dominicans (known as the "Jacobins") on Rue St Honoré. His remains, it would appear, were dispersed during the French Revolution.

Heritage and Rupture with Tradition

Campanella's opposition to Aristotelian philosophy was stated strongly in his first published work and permeated his entire philosophical enterprise. While still a Dominican student, he already showed signs of an increasing disenchantment with the exclusive teaching of scholastic Aristotelianism in the houses of study, and sought opportunities to read, clandestinely, the works of Plato and the Neo-Platonists, Pliny, Galen, the Stoics, the Hermetic corpus, and other texts on natural philosophy. Campanella disavowed the primacy afforded to Aristotle by his Peripatetic followers and was deeply critical of the intellectual dogmatism that resulted from Aristotelian philosophy being considered as containing the fullness of truth. This, he asserted, shunned the importance of empirical knowledge and observation especially in the fields of natural philosophy and metaphysics. His later defenses of Telesio and Galileo, two of foremost critics of the predominant Aristotelian physics, marked the high points of his break with the Aristotelian tradition.

The influence of humanists such as Ficino (Giglioli 2013), Pico della Mirandola, and Patrizi on Campanella went beyond their Neoplatonism and extended into the fields of magic and astrology. However, he did not spare criticism of what he depicted as the humanists' overreliance on books at the expense of overlooking the knowledge that can be derived for nature's "great book" (Ernst 2010; Gatti 2010). In a 1607 letter, he famously explained the difference between his own "way of doing philosophy" and Pico's by stating that he "learns more from the anatomy of an ant or of a herb than from all the books that

have been written since the beginning of time, after learning how to philosophize and learn the book of God [i.e. nature].” Elsewhere he also decries the humanists’ penchant for their overly ornate use of language, which, Campanella maintained, often led to obfuscation and unnecessary confusion.

Campanella defined himself as a true disciple of Aquinas and in many of his works he sought to interpret and develop the Angelic Doctor’s thought in the light of more recent developments and discoveries. His brand of Renaissance Thomism sought above all to reconcile the key elements of Telesio’s naturalism with the theology of Aquinas, given that he saw himself as an intellectual heir of both. Following the currents of reinterpreting Aquinas by scholars such as Cardinal Cajetan (Tommaso de Vio), who he quotes often albeit not always approvingly, Campanella sought to show how Thomism, and Christian philosophy in general, should not be reduced to Aristotelianism (Delumeau 2008, 301–307; Sgarro 2018). In *De gentilismo non retinendo* (1643, 60), he makes the bold assertion that “St Thomas is not a Peripatetic.” His brand of Thomism often placed him at odds with both his Dominican confreres and Jesuit thomists, although his reception among the latter has been viewed as being generally more positive than among the former (Lerner 1995, 1998).

Machiavelli, or rather his followers (“machiavellisti”), were the main object of Campanella’s criticism in his works on politics and religion (Panichi 2015). Like Botero before him and Grotius after him, the Calabrian philosopher rejects the doctrine of the “reason of state” (*ragion di stato*) that descended from Machiavelli (Ernst 2006). He considered this doctrine to be ineffective because its reliance on history and political action excludes the broader and more complex considerations on the causality of events (Ernst 2006). Campanella opposes the “Machiavellian politicians” equation of power and the highest good, accusing them of reducing justice to mere power and of instigating political division. This was diametrically opposed to his own ideal of moving towards political unity through the establishment of a universal monarchy. Unlike

Giordano Bruno, he also rejects what he defines as the Machiavellian view of religion as a political construct and instrument (De Lucca 2021). Throughout his works, Campanella juxtaposes “politicians” and “philosophers and prophets,” accusing the former of constantly persecuting the latter in order to advance their erroneous view of reality based solely on considerations of political power and ambition (Ernst 2002, 143–197; Suggi 2018).

While Aristotle is the chief target of Campanella’s criticism in the fields of natural philosophy and metaphysics, and Machiavelli in the political realm, Luther and the Reformers are denounced as causing division on the religious plane. Besides engaging with various theological arguments, Campanella’s major contention is that the division brought about by the Reformation fragmented religious unity, which he held to represent the strongest political bond (the “unity of souls”), thus pushing humanity further away from the desired return to original unity. Notwithstanding the heterodoxy of some of his ideas and the charges of heresy levelled against him, it has been noted that Campanella remains “a free but Catholic thinker” (Giovannozzi 1996). His specific religious heritage is reflected in the universalism reminiscent of the medieval *respublica christiana*, from which his ideal of reunification after the Reformation draws partial inspiration; a deeply reformed and cleansed Catholic Church, he thought, could serve as a catalyst for achieving this ideal. There are various parallels between his vision of religious concord and reunification and the ideas of Bodin before him, and Comenius and Leibniz after him.

Innovative and Original Aspects

The vicissitudes of Campanella’s life and the publishing obstacles he faced resulted in a vast but fragmented corpus. The rewriting of stolen or confiscated works, and the need to self-translate others to facilitate their publication, contributed to obscuring the fundamentally unitary character of his works and the architecture of his philosophical project (De Lucca 2012). Campanella never

managed to complete the task of giving a unitary form to his works as he outlined it in *De reformatione scientiarum* (1638), the index of his projected *opera omnia*. When considering his works in their entirety, he may be rightfully placed alongside Francis Bacon, Comenius and other reformers who developed innovative approaches to knowledge and learning. Comenius himself acknowledges Campanella's direct influence on his own theory of education and pedagogy.

Campanella's epistemology points in the direction of the unity of knowledge, but in the *Meta-physica*, he also posits the doctrine that "to know is to be" ("*cognoscere est esse*"). Developing Telesio's pansensism, he elaborates a version of panpsychism in his metaphysics and epistemology to affirm the position that all things are sentient, although the degree of sentience (*sensus*) depends on the kind of being. The theory of universal sentience is connected to the doctrine of the primalities found at the core of his metaphysics (Ernst 2010; Headley 1997). The three metaphysical primalities of power (*potential*), wisdom (*sapiential*), and love (*amore*) are the manifestations of the internal dialectic within the infinite Being-One (the Prime Unity), in which they have their fullness. The multiplicity of other (finite) beings, then, participate in varying degrees in the unity of Being. While all beings are infused with a certain degree of sentience on account of the corporeal sentient spirit (*spiritus*), human beings are further endowed with an incorporeal soul (*anima/mens*) infused by God (De Lucca 2015a).

Campanella's political universalism, which reaches the peak of its expression in his idea of the universal monarchy, transcends its medieval roots and contains elements of what may be considered as pioneering ideas of world governance and global distributive justice (De Lucca 2017a). It is also connected to some of the more innovative aspects in his philosophy of religion, particularly his views on natural religion (Blum 2010), which have been mentioned briefly above. The complexity of Campanella's thought combines his proposed reform of knowledge and the sciences with his project for political and religious reform (Fournel 2012).

One other aspect of originality in Campanella lies in his philosophical poetry, which has received considerable attention in Italian literature as one of the foremost examples of its genre (Roush 2002). In his *Poëtica*, Campanella counted himself among the "poetizing philosophers" who employ poetry and poetic discourse to illustrate philosophical ideas. Apart from his poetry, which reflects the variety of concepts elaborated elsewhere in his writings, he employed this style in the "Poetical Dialogue" that is *The City of the Sun*. Campanella's utopia stands as one of the most representative examples of its genre in the Renaissance and had a direct influence on later utopias, such as Johann Valentin Andreae's *Christianopolis*. Moreover, the originality of Campanella's utopianism lies also in his unique theoretical justification for the genre. In the last of the four *quaestiones* that accompanied his political treatise (to which *The City of the Sun* was placed as an appendix), he invokes the authority of "the most recent martyr" Thomas More, Plato, Aquinas, and others, as well as his own doctrine of the primalities, to respond to eight objections raised by critics who argue that it is useless to write about something that is impossible to achieve.

Impact and Legacy

Campanella's fame during his lifetime and in subsequent centuries was due in no mean way to his life story, especially the foiled revolt in Calabria and his endurance of a long imprisonment. His reception was often contradictory, oscillating between views of him as a pioneering reformer of considerable originality to caricatures of him as a somewhat outdated thinker and meddler. Such assessments must be considered in the light of the specific contexts of his reception. Careful consideration should also be given to the history of the circulation of his works, a comprehensive account of which remains a research desideratum notwithstanding significant advances in this regard in recent years (Ricci 2018).

It should suffice to point out that although Campanella is known mostly nowadays as the

author of *The City of the Sun*, other works surpassed it in popularity during the sixteenth and seventeenth centuries. In England, for instance, his *De sensu rerum et magia* and *Medicina* circulated widely and had a positive impact on the Hartlib circle and other scholars close to the Royal Society. At the same time, the *Monarchia di Spagna* fueled an aggressive reaction from strongly anti-Spanish and anti-Catholic quarters, where Campanella was denounced as a “Spanish Jesuit” [sic!] and “second Machiavel” whose plots to “reduce England unto Popery” were being advanced by the Royal Society. Likewise, in the Low Countries, the circulation of a Latin translation (not by Campanella) of a chapter of the *Monarchia di Spagna* (Ernst 2010) led to the philosopher being perceived as a promoter of Belgium’s subjugation by Spain. On the other hand, the Flemish physician Jan Baptiste van Helmont was impressed by some of Campanella’s ideas in the *Medicina*, *De sensu rerum et magia* and other texts. In Germany, where many of his works were published, Campanella was hailed in some Protestant circles as a vociferous critic and victim of the Roman Church, while Hermann Conring propagated the view that had been expressed by Dominican censors in Rome that the *Atheismus triumphatus* presented in a veiled manner the author’s admiration of Machiavelli and the transmission of his own atheism (Panichi 2016). Positive views of the Calabrian philosopher include those expressed by Alsted, whose affinity with Comenius and Campanella is acknowledged, as well as by Leibniz, who cites Campanella approvingly in several works. Two centuries later, Schopenhauer wrote favorably about his views on magic and, significantly, on justice.

Campanella’s reception in France has been studied more systematically (Lerner 1995) and displays the same sort of ambivalence. Jacques Gaffarel was among his main supporters, while Nicolas Claude Fabri de Peiresc and Pierre Gassendi engaged courteously with his ideas (even when he expressed reservations about the latter’s atomism). The Paris-based Dutch scholar Hugo Grotius wrote a commentary on Campanella’s political aphorisms (De Lucca

2015b). Marin Mersenne, on the other hand, showed himself suspicious of what he viewed as eccentric behavior and ideas. Descartes was even more critical: after including Campanella among the “*novatores*” (together with Telesio, Bruno and others) – a term which has sometimes been interpreted as pejorative – he ultimately refused to even read his works, ostensibly after reading the *De sensu rerum* (Duncan 1991; De Lucca 2015a). Descartes’ judgement impacted the relegation of Campanella in later historiography well beyond France.

Ideological appropriations characterized much of the Campanella’s reception during the late nineteenth and twentieth centuries, both in Italy, where most of the scholarship was concentrated, and elsewhere. Even recent attempts at shedding light on such appropriations and interpretations run the risk of perpetuating some of their tenets and dichotomies (Addante 2018). The most important contribution to scholarship on Campanella in recent decades has taken the form of privileging his texts: editions, revised editions, new editions, digital editions, and translations have made his oeuvres more widely available in a bid to enable a better appreciation of his thought, and to sustain further and deeper research (Ernst 2016).

Early in the twentieth century, Étienne Gilson lamented the persistent prejudice and unfair assessments against Renaissance philosophy, noting that “perhaps the most ill-treated of the thinkers of that epoch is Campanella” (Gilson 1912/1913). A century later, the revived interest in Renaissance philosophy and the increased access to Campanella’s works bode well for a reversal of fate.

Abstract

Edmund Campion SJ was a Jesuit and martyr, eminent scholar, and orator who worked as lecturer of Rhetoric in Oxford and professor of Rhetoric and Philosophy in the Clementinum in Prague. Deeply admired by his contemporaries as an eloquent and elegant orator, he is best remembered for his powerful sermons, which he delivered to crowds in many parts of England and Bohemia. In 1580, he moved back to England to begin the English mission and minister the Catholics. During the last year of his life, he published *Decem Rationes*, an apologetical work addressed to the theologians of the Established Church of England, which immediately spread across Europe and became his most popular work. He also wrote the first history of Ireland in the English language and many poetical and dramatical works.

Biography

Edmund Campion was an English Jesuit and martyr, eminent scholar, and eloquent orator admired and called by his contemporaries as the “English Cicero” (Alfield [1582](#); Bombino [1620](#); Turner [1602](#)). He was born on 25 January 1540 to a *bibliopola* (stationer), who died before he was twelve, so, after starting his education at St Paul’s

School, he was sent to the newly founded orphanage, Christ's Hospital, in 1552 (Alfield 1582; Bombino 1620; Kilroy 2015). Even at a young age, he excelled himself in school debates and literary competitions.

In 1561, Campion was admitted as a fellow to the newly restored St John's College in Oxford (Kilroy 2011; 2015). Here he read philosophy and theology, and completed his Bachelor of Arts in 1564. On September 1564, Campion was made lecturer in Rhetoric from 1564 to 1570. While at Oxford, Campion spoke before Queen Elizabeth I during her visit to Oxford on 3 September 1566 and wrote his first Latin epic poem, *Sancta Salutiferi nascentia semina verbi* (The birth of the sacred seeds of the Word that brings salvation) in which he contrasts the transience of the Roman Empire to the permanence of the Early Christian Church (Kilroy 2005). In 1569, Campion became a deacon of the Church of England, ordained by Bishop Richard Cheney, Bishop of Gloucester, and accepted a benefice (Simpson 1896; Pollen 1905; Kilroy 2015).

In 1570, Campion traveled to Ireland, invited by his former pupil, Richard Stanihurst, whose father, James Stanihurst, was Recorder of Dublin and Speaker of the Irish lower house (Alfield 1582; Bombino 1620; Simpson 1896; Kilroy 2015). During his brief stay here in Dublin, Campion wrote, *The Two Bookes of the Histories of Ireland*, the first systematic history of Ireland in English (Campion 1633, 1963). It was most probably also during his stay in Ireland living with prominent Irish Catholics, such as the Stanihurst and Barnewell Families, that Campion decided to convert to Catholicism, which at this point was outlawed in England. Facing serious threats of arrest for high treason, Campion departed for England in June 1571 and arrived at the English College of Douai later that month. At Douai, he studied scholastic theology and passed the Bachelor of Theology. After only 18 months, still undecided in his vocation, Campion made a solitary pilgrimage to Rome, dressed as a beggar (Simpson 1896; Kilroy 2015). Here he decided to enter the "newly formed" Society of Jesus and was allotted to the Austrian Province (McCoog 2007). Campion was then sent to the novitiate in

Prague in 1573, which then moved to Brno. A year later, he was re-assigned to Prague to work at the Jesuit College, the Clementinum. He served as spiritual director of the Sodality of the Salutation of the Blessed Virgin and was made a professor, first of Rhetoric and later of Philosophy, teaching Aristotle's *Logic* and *Physics* after his ordination in 1578 (Alfield 1582; Bombino 1620; Simpson 1896; Kilroy 2015). Here Campion delivers his speech on *De Iuvene Academico* (On the Young Scholar) a discourse, in which he sets out his views on education and the ideal student. It was also during these years that Campion wrote *Tractatus de Imitatione Rhetorica* (Tract on Rhetorical Imitation), a treaty, which discusses the models of rhetorical invention and the imitation of the Ciceronian style (Campion 1631; Turner 1602). He also received prestigious royal engagements for the new emperor, Rudolph II, and his court (Kilroy 2015; McCoog 2007, 2013). In 1577, Campion delivered the *Oratio in funere Mariae Cardonae*, a funeral sermon for Maria Cardona y Requesens, and, after his ordination in 1578, wrote the play *Ambrosia* that was performed in the presence of Rudolph II and of the Dowager Empress, Maria Augusta (Campion 1970; Kilroy 2015; Campion 1631; Turner 1602). In 1579, Campion was called back to Rome to lead the first English Mission and minister to the Catholics in England (Reynolds 1980). He turned down the request to be superior but created a sensation preaching in southern shires of Berkshire, Oxfordshire, Northamptonshire, Yorkshire, and Lancashire (Alfield 1582; Bombino 1620; Kilroy 2016). He then printed his famous polemical work, *Decem Rationes* (The Ten Reasons), which was distributed at the Commencement in St Mary's Church, in Oxford (Lake and Questier 2000; Lennon 2007; Kilroy 2011). He was arrested, put on trial, and hanged at Tyburn on 1 December 1581. Campion's work, *Decem Rationes*, quickly spread across the Channel and was printed in over 80 subsequent early modern editions and translated into 12 languages (Pollen 1905; Waugh 1935; Kilroy 2016; Campion 1581, 1631, 1632). He was canonized by Pope Paul VI on 1970 as one of the 40 Martyrs of England.

Canaye, Philippe

Born: Paris, 1555

Died: Paris, 25 February 1610

Violaine Giacomotto-Charra
Université Bordeaux Montaigne, UFR
Humanités, Pessac, France

Abstract

Philippe Canaye was a jurist, initially brought up according to Calvinist principles before converting to Catholicism. He played an important political and diplomatic role under

French Kings Henry III and Henry IV. In the field of philosophy, he produced a paraphrase of the *Organon* in French, the first vernacular adaptation of the text, and spoke out in favor of instrumental logic.

Alternate Names

[Canaye, Philippe, sieur de Fresne](#); [Canaye, Philippe du Fresnes](#)

Biography

Philippe Canaye was the son of Jacques Canaye, a lawyer at the Parliament of Paris. He trained as a jurist and chose Protestantism as his religion. In 1572–1573, he was in Italy and accompanied the French ambassador to Constantinople. In his account of travels, his *Ephemerides* (published only in 1897), he reflects on the religious tolerance practiced in Constantinople and levels criticism at French intolerance. He in turn became a lawyer at the Parliament of Paris (he was a friend of Du Vair and De Thou), and, under French King Henry III, he purchased a position as Conseiller d’État. He grew in eminence when Henry IV sent him as an ambassador to several European Protestant countries (England, Switzerland, and Germany). In 1595, he presided over the bipartite chamber of Languedoc, established in Castres. He was also one of the judges at the 1600 “Conférence de Fontainebleau” between the Catholic Du Perron and Protestant Du Plessis-Mornay. He himself converted to Catholicism in 1601. He was then appointed ambassador to Venice, a post in which he remained until 1607. He returned to Paris and died in 1610. He distinguished himself throughout his career for his efforts to promote peace, goodwill, and religious tolerance across the kingdom.

Works

Philippe Canaye’s most distinguished contribution to the history of philosophy is his publication in 1589 of *L’Organe, c’est-à-dire l’Instrument du*

Discours. This text is a paraphrase rather than a translation of Aristotle's *Organon*. As M.L. Demonet has shown, it was probably inspired by a paraphrase penned in Latin by Claude Aubery - *Organon, id est Instrumentum doctrinarum omnium* (1584). As the title indicates, the text defends logic as an instrument or tool of reason and science, rather than as a science per se. Canaye considers that analytical philosophy is the most important element in logics and he asserts that "l'art du discours donc ne consiste pas à trouver l'ornement du langage, mais à fonder et établir la raison par laquelle on puisse contempler clairement la vérité" [the art of discourse does not then consist in uncovering the ornaments of language, but rather in founding and establishing reason as a basis for plainly contemplating truth] (*L'Organe*, Préface).

The Preface to *L'Organe* is a key element of the work. In it Canaye defends a highly political conception of the role of logic. He sees logic as a means of promoting goodwill, national unity, and religious tolerance and also as a means of harmonizing opposing modes of reasoning and thereby bringing appeasement to controversy.

Cano, Melchor

Born: 6 January 1509 (or 1506) in Tarancón, Spain

Died: 30 September 1560 in Toledo, Spain

Boris Hogenmüller

University of Würzburg, Würzburg, Germany

Abstract

Living during the sixteenth century, the Spanish Dominican Melchor Cano was the first in the history of theology who attempted to write a theoretical treatise concerning theological topology (*loci theologici*) by collecting unique theological places (e.g., the authority of the Holy Bible) and combining them with foreign ones (e.g., the authority of History). His intention was to create a reliable manual to be used in theological disputes with heretics and pagans. Developing this system, Cano was laying the foundations of fundamental theology.

Alternate Names

Melchior Canus

Biography

Melchor Cano was born in Tarancón in the diocese of Cuenca on 6 January 1509 (or 1506) as the son of Fernando Cano, a lawyer, and his wife Maria Delgado de Valle. In August 1524 he joined the Dominican Order and started to study theology and philosophy in Salamanca and Valladolid in 1527. His teachers were the famous Diego de Astudillo and Francisco de Vitoria, whose successor Cano became as professor of theology at Salamanca in 1546. His philosophical teaching activities had already started in 1533 at the Convent San Gregorio in Valladolid; from 1536 he taught theology and was also appointed as professor of philosophy at the University of Alcalá de Henares in 1542. In the academic years 1546/1547 and 1547/1548, Cano first held lectures about the fourth book of *Sentences* of Peter Lombard – the two *Relectiones, de sacramentis in genere* (1548) and *de sacramento pœnitentiæ* (1549), resulted from this. At the request of Charles V, to whom Cano was advisor in theological questions, he was nominated council advisor on 30 December 1550 and participated in the second session of the Council of Trent (1551/1552). Cano actively joined the discussion on the Eucharist, penance, and the question of the sacrificial character of the mass.

After his return from the Council, he was appointed bishop of the Canary Islands by Pope Julius III. Cano, however, did not take this position and subsequently renounced both the bishopric and also his professorship in Salamanca (1554) and retired to the Convent at Piedrafita near Avila. In the same year, he was elected rector of the San Gregorio College in Valladolid (1557) and became Prior of St. Esteban in Salamanca. At the same time, he was also elected Provincial Superior, but without being confirmed by the Pope; during a visit to Rome in 1560, Cano finally received the papal confirmation after his reelection. On 30 September 1560, Melchor Cano

died unexpectedly at the age of 51 in Toledo (Caballero 1871; Belda Plans 2006).

Despite his obvious genius in matters of theology, Cano is still classified as characteristically difficult in modern research (Sanz y Sanz 1959). On the one hand, this is justified by Cano's hostility to the Order of the Jesuits (founded in 1534), which can clearly be seen from several documents, e.g., *Carta de Melchor Cano al P. Fr. Miguel de Arcos, sobre los Jesuitas. Valladolid, 1556* (= nr. 32); *Carta de Melchor Cano al Venerable M. Venegas, sobre los Jesuitas. Valladolid 28 de marzo de 1556* (= nr. 33); and *Carta de Melchor Cano à Fr. Juan de Regla, sobre los Jesuitas. Salamanca 21 de setiembre de 1557* (= nr. 44). Cano denounced the Jesuits to be the *pseudo-Sophistæ* and *pseudo-Prophetæ* and compared the appearance and conduct of the Society of Jesus with the work of the Lutherans in Germany and the resulting harm to the Catholic Church. That the Dominican remained a fanatical opponent of the *Societas Iesu* until the end of his life is a judgment that can be very clearly seen by the cited letters (Hogenmüller 2013a).

On the other hand, Cano's rigorous behavior toward his friar Bartolomé Carranza is often quoted, which ended with the well-known *Censura* commissioned by the Inquisition (Tellechea Idígoras 1992; Hogenmüller 2012). The origin of the confrontation of the two Dominicans arose in the private sector, probably at the time of their studies: old rivalry mixed with private presumptions was the foundation, the difference in theological issues and ideas intensified the conflict, so that hostility emerged out of suspicion. It may also be possible that the application for the position of the Provincial Superior of Castile, which Carranza was finally awarded, was the decisive reason for escalation (Caballero 1871). The conflict culminated in Cano's drafting of two reports – one with 130 Latin and one with 205 Spanish censored sentences – to Carranza's *Comentarios al Catechismo christiano* (Carranza 1558) at the instigation of the Grand Inquisitor Fernando de Valdés y Salas, the archbishop of Seville, in 1558.

Cano's *Censura* clearly reflects the practical use of the theoretical concept of systematic theology pointed out in *De locis theologicis*: using

Cano's concept, the theologian can refute the heresies with the arguments taken out of the different *loci*. Similarly, he is able to confirm his own position (Ulrich 1989). The criticized and refuted sentences in Carranza's *Comentarios al Catechismo christiano* are perfect examples of Cano's theoretical concept.

A few months after writing the *Censura*, however, Cano himself became the focus of the Inquisition. The reasons are not clearly defined in the sources. Nevertheless, it is possible to reconstruct some of the charges and allegations brought against Cano which probably provoked the investigation of the Inquisition among others. Today, it seems clear that many of these accusations against Cano and his theological work may have emerged prior to the publication of the *loci*, but have just been written down after the *editio princeps* – a fact that prompted the French Dominican Francois-Jacques-Hyacinthe Serry (1658/1659–1738) to publish a short paper entitled *Melchioris Cani Vindicationes quibus nonnullorum in ejus libros de locis Theologicis accusationes refellentur* (Serry 1714), which he arranged as a preface in his edition of *De locis theologicis*. There Serry listed the suspicious parts of the *loci* including the accusations and tried to refute them. Though Serry wrote the *Vindicationes* almost 150 years later, in 1714, the mass of charges and suspicious parts is still astonishing showing the explosive nature of Cano's writing – even in a time after the publication of the “expurgated” version of the *loci*.

Works

During his lifetime Cano published the following works: *Relectio de sacramentis in genere* und *Relectio de sacramento poenitentiae* (Salamanca 1550; Cano 1550a) *Tradado de la Victoria de sí mismo* (Valladolid 1550; Cano 1550b) Cano's votes at the Council of Trent in the conciliar documents (1551) (= CT VII/1,124–127. 261–264. 387–390); *Consulta de theologos, si Su Magestad puede pedir á Su Santidad para vender los vasallos de las Iglesias de España y Respuesta de los Theologos* (Valladolid 1553;

Cano 1553) his expertises for the Emperor: *Parecer de Fr. Melchor Cano sobre la guerra con el Papa Paulo IV* (1556); *La censura de Melchor Cano y Domingo de Cuevas al Catacismo y otros escritos de Carranza* (1559). In this list his *magnum opus*, *De locis theologicis* (Cano 1563), is outstanding (Hogenmüller 2013b). The composition of the *loci* was probably started during Cano's time at the University of Alcalá de Henares around the year 1543, the year of its completion is uncertain. The *editio princeps* was published posthumous in 1563 at Salamanca. Other prints were made in 1564 at Leuven, 1567 at Venice, 1569 at Leuven again, and 1585 at Cologne.

Innovating and Original Aspects

In Cano's *De locis theologicis*, which consists of twelve books, the first attempt in the history of theology was made to select from the rich fund of so-called *topoi* those which are peculiar to theology and to arrange them by observing their inner strength and their power in discussion or dispute. In doing so Cano directly relates on Rudolph Agricola's famous treatise *De inventione dialectica*, which was first published in 1515. There, Agricola considered the main purpose of dialectic to be the invention of arguments and the structure of the argumentation according to the rhetorical theory of the antiquity. Following these principles and applying them on the matters of theology, Cano identifies ten “places of theology”; each of them he made subject of a single book. In every book, however, the intention is to define the argumentative force (*vis*) of the discussed *locus* and to determine finally from which of those *argumenta certa* or *argumenta probabilia* can be extracted.

Concerning his selection there are seven peculiar theological places (*proprii loci*) – e.g., the authority of the Holy Bible, the authority of the Church Fathers, the authority of the Councils – which contain the written and spoken words of men who wrote or spoke in the presence or under the influence of the Holy Spirit (*spiritu sancto adspirante*). These places include arguments of

authority (*auctoritas*) which the theologian has to use in disputations against heretics.

But according to Cano, there are three more places the theologian has to examine, although they are not common to theology: Philosophy, the authority of the Natural Philosophers – that means the old pagan philosophers like Plato and Aristotle – and the authority of the Secular History. These are places which are foreign to theology (*loci alieni*), but implicate certain (*argumenta certa*) or at least probable arguments (*argumenta probabilia*) as well. For Cano this shows that they should also owe authority in the theological discussion. Consequently, it is necessary to use both sources of arguments, the peculiar and the foreign, in order to succeed in every dispute concerning Christianity.

In order to prove his method, Cano gives three different practical examples in the twelfth book of the *loci*, entitled *De locorum uso in scholastica disputatione*. The third and last example relating on the Immortality of the Soul (*de immortalitate animae*) is of special quality. As the discussion touches both types of places, Cano assumes it needs *argumenta propria* as well as *argumenta aliena* to be entirely convincing (Hogenmüller 2013c).

By developing this kind of system, Cano created the foundations of systematic theology, which dominated theology for centuries. During the seventeenth and eighteenth century, Cano's outstanding work gave influence to several catholic writers (e.g., Gaspard Juénin, Girolamo Buzi, Johann Opstraet, and Benedict Stattler) who equally wrote short compendiums about the peculiar places of theology.

Carafa, Diomede

Born: 1406 or 1408, Naples

Died: 17 May 1487, Naples

Enrica Guerra

Università degli Studi di Ferrara, Ferrara, Italy

Abstract

Diomede Carafa, trusted aide of Ferdinand of Aragon, was in charge of educating the king's children. He continued to exercise this role even when they were adults, writing for each of them a *Memoriale*, a work through which, following the tradition of the *Specula principum*, as well as the thought of the ancient philosophers, he suggested to each of them how to live their lives whether as a man of arms or a king or a princess.

Biography

Diomede Carafa was the youngest son of Antonio Carafa, well known as a warlord with the nickname of “Malizia,” and Caterina Farafalla. At about 20 years of age, once the struggles for the inheritance of the Kingdom of Naples had been resolved, Diomede accompanied Alfonso of Aragon to Spain. We do not know exactly what the role of Carafa in the Spanish royal court was, but we can assume that he had been able to earn the trust of Alfonso, since he once again fought alongside him in 1442, during his campaign in Naples for the conquest of the kingdom.

Certainly, Carafa developed close ties to Alfonso's son, Ferdinand, becoming his trusted aide once he inherited the Kingdom of Naples. In return for his loyalty and able leadership in diplomatic affairs on behalf of Ferdinand, Carafa obtained considerable political power and distinctions, including his appointment to the Order of the Ermine. He also obtained a number of noble titles and lands, most importantly that of Earl of Maddaloni's land.

One of Carafa's preeminent roles was as educator of Ferdinand's children (Alfonso, Giovanni,

Federico, Eleonora, and Beatrice). He continued to exercise mentorship over them once they had reached adulthood, writing for one of them a *Memoriale* on good behavior. Carafa is mainly remembered today for his *Memoriali*, which also include instruction manuals for being a good courtier and a good wife and a book dedicated to Henry of Seville and Toledo. These writings' dates of composition range from 1467 to 1479.

The first *Memoriale* (1467) was dedicated to the older Ferrante's son, Alfonso of Aragon, Duke of Calabria, on the occasion of the alliance of Naples, Florence, and Milan against Venice. In 1470, during the fights of Henry of Castille against Alfonso v of Portugal, he composed, under the name of Ferdinand of Aragon, King of Naples, the *Memoriale in nome di Ferdinando primo re di Napoli ad Arrigo di Siviglia e di Toledo*. Probably between 1472 and 1476, he wrote *I doveri del principe*, which was dedicated to Eleonora of Aragon, Duchess of Ferrara. In 1476, he composed two *Memoriali*: one for Beatrice of Aragon and the other for her brother Francesco who came with her to Hungary, where Beatrice married King Matthias Corvinus. They are the *Memoriale a Francesco d'Aragona* and the *Memoriale alla serenissima regina de Ungheria*. Some contents of this last work are similar to those of the *Memoriale et recordo de quello have da fare la mulglier per stare ad bene con suo marito et in che modo se have ab onestare*, dedicated to an unknown woman (Carafa 1988a, b, c, d, e, f, g, h, i, j, k, l, m).

The *Memoriale* of Giovanni of Aragon (1478), cardinal and papal legate in the Kingdom of Hungary, was followed by a *Memoriale per il capitano prudente* (1479), dedicated, once again, to Alfonso of Aragon, who in 1479, after the Pazzi conspiracy in Florence, helped the pontiff's army against the Medici. Carafa's last treatises also date from 1479, the *Libro delli precepti o vero instructione delli cortesani*, which seems to be dedicated to Diomedè's oldest son, Giovanni Tommaso, and a second *Memoriale* is dedicated to Federico of Aragon who was moving to France to marry Anne of Savoy, the niece of King Louis XI of France.

After these years, Carafa seems to have ceased to write, perhaps because he had reached his

purpose of imparting, through a series of books, a range of moral precepts or suggestions to the sons and daughters of the King of Naples. After writing these *Memoriali*, Carafa totally dedicated his life to diplomatic affairs until his death on 17 May 1487 (Petrucci 1976a, b).

Despite his literary activity, we do not know much about Carafa's studies both during his boyhood and adulthood, even if we can assume, from the contents of his works, that he was acquainted with ancient and contemporary authors. Probably he attended Naples' literary circles, and certainly he was part of Giovanni Pontano's Academy, which exercised a significant influence on Carafa's literary activities.

His works, like some others that come from the fifteenth century's Neapolitan literary environment, reflect the moods and political situations of the Kingdom of Naples during the reign of Alfonso of Aragon and, above all, of his son Ferdinand, who had been involved, for all of his reign, in fights against the kingdom's barons and in the struggles among the Italian states. But it is surely due to internal political problems that Neapolitan literati focused their attention, in the fifteenth and sixteenth centuries, on political topics, giving rise to a series of works in which they advised princes and princesses how to live their lives and relate to people around them (Sapegno 1984; Villani 1996).

Certainly the main known work that depicts this Neapolitan tradition of political and behavioral treatises is Giovanni Pontano's *De Principe* (Pontano 2003), whose style may have inspired Carafa's treatise *I doveri del principe*. Like Pontano, Carafa lists and describes the moral virtues that a prince should possess in order to create harmony and order among people and between him and his subjects. Carafa, as well as Pontano before him, follows an established view, which derives from antiquity, according to which a kingdom is a mirror of its sovereign. Thus, in his *Memoriali*, he emphasizes the function of a virtuous prince as the main guarantee for an ordered reign.

Among all the moral virtues, Carafa gives a prominent and essential place to the princely virtue of justice. The high value attributed to this

virtue links Carafa's works not only to Pontano but also to the ancient tradition, especially to Cicero and Aristotle, more than to Plato, probably studied by Carafa but certainly known through Pontano and Petrarch's *Epistolario* (Patrizi 1984; Persico 1899). This kind of knowledge seems to have been used, by Carafa, to adapt the ideas expressed by the ancient philosophers to the reality of Carafa's time. Above all, according to him, justice seems to express the measure of the ability of a prince or princesses to govern a kingdom and defines their relationships with their subjects. It seems that the ability to rule well in everyday life is the main characteristic of the modern prince, the one that distinguishes him from the prince described by the medieval *Specula principum*.

Carafa was well acquainted with and was likely influenced by the *Specula principum* tradition, including its evolution during the fourteenth and fifteenth centuries. Originating from a medieval line of thought that made the king's power derive directly from God, the *Specula* saw God as the only one to whom the king was responsible for his actions. As an intermediary between God and the people, the prince was expected to exercise virtue and avoid vice (Sapegno 1984); thus, the *Specula* often included a catalogue of virtues and vices, and Carafa's *Memoriali* follow this model, both ideologically and stylistically. Furthermore, according to Carafa, God is the source of the prince's misfortunes; he must face them patiently (Carafa 1988b, e, f, g). In this way, he can be considered a good sovereign and gain the obedience of his people.

Carafa saw patience and prudence as the foundation of a way of living that was called the *giusto mezzo* ("golden mean"): the ability to live life according to the right measure, whether in actions or words. This outlook connects the *Memoriali* to the medieval *Specula* and, above all, to Aristotle. Pontano had referred to it often, and Carafa strongly developed it, making it a leitmotiv of his entire oeuvre and probably of his life. In all his treatises, he explained to his addressees how to live rightly, within the *giusto mezzo*, not giving them an abstract law, but practical directions that they could, immediately and directly, apply in their everyday life.

The purpose of Carafa's *Memoriali* was not, however, to create an exemplary prince, like the one auspicated by the political and pedagogical-behavioral treatises that had been written during the fifteenth century. Rather, through his works, Carafa depicted concrete life situations, as well as concrete characters that could be found in the reality of his time. Carafa's innovation is his focus on real characters, in need of practical suggestions. This approach contrasted with political and pedagogical treatises that had concentrated their attention on building a perfect, as well as a hypothetical, prince or courtier. An example of his practical instructions for deportment is his suggestion to Eleonora of Aragon that "it is not true that you have to give your goods to your subjects in order to be loved by them, but it is enough if you do not deprive them of theirs." And we can find a sort of application of these words in some letters of hers addressed to Ercole of Este in which she recommends that he must control his soldiers and that he should punish them if they kill, steal, or beat his subjects, because in this kind of actions "I see a real danger" (of subversion of his political power) (Guerra 2005). It is also notable that Carafa's texts were written in the vernacular, so as to meet the needs of his audience more immediately.

This focus on real people and situations is also characteristic of *I doveri del principe*, Carafa's most-studied work. As a counselor to the powerful, Carafa had a particular insight into what the prince needs to consider in his decision-making. Thus, Carafa emphasized a focus on the needs of the state, leaving aside considerations having to do with relatives and friends (Carafa 1988b).

Four themes of Diomede Carafa's life and works are especially significant: his view that experience should be the sole guide of policy, the importance of wisdom and wit, the role of courtesy and *humanitas* (i.e., the *giusto mezzo*), and, finally, the obedience and loyalty that the sovereign should be able to elicit from his subjects by making use of the other three values mentioned (Miele 1989; Miele 1976). The focus on experience underlines Carafa's emphasis on everyday observation of facts, leading to the prince's ability to solve problems concretely. According to

Carafa, this was more important than any abstract law or idea if a man or a woman wanted to have an ordered reign. As for wisdom and wit, they are the means through which a sovereign can display his ability to solve political problems. A prince who has them is surely able to live his life and to rule his reign according to the *giusto mezzo*. In this context, words (whether spoken or heard) play a fundamental role in solving or preventing problems and are thus essential to wisdom and wit, as well as to courtesy and *humanitas*.

Finally, according to Carafa, it is only through moderate gestures and a moderate use of words that a prince can display his wisdom. Although similar features are emphasized in Pontano and in Baldassarre Castiglione's *Il libro del Cortegiano* (Castiglione 2000) – a work that is often connected to Carafa's courtier – Carafa's works differ from theirs because he gives steady attention to reality, eschewing the temptation to create abstract characters. For him, literature offers men and women concrete guidance, not just inspiration.

Biography

The name “Caramuel” is a Spanish variant of “Kramer” (when he was in Salamanca, Caramuel still used Charamuer or Caramuer). His father, Lorenzo Cramer, was from Luxembourg and was a military engineer and amateur astronomer. His mother was Catarina De Vries, and his maternal grandmother is believed to have come from the noble Lobkowitz family.

Caramuel studied philosophy at Alcalá de Henáres (under Benito Sánchez, John of St. Thomas (João Poinset), Juan Martínez Prado, and Pedro Lorca) and theology at Salamanca (under Francisco de Araújo and Ángel Manrique). He joined the Cistercian Order in 1625 at the Royal Monastery La Espina near Valladolid, taking his religious vows in 1627. Later he resided and taught at various monasteries in Spain and Portugal. Between 1635 and 1638, he was a doctoral student at the theological faculty in Louvain where he met Cornelius Jansen (1585–1638) and took part in the intellectual debates between Jansenists, Irish Franciscans, and Jesuits in this era. In the most important debate – that over the work and legacy of Jansen – he sided with the Jesuits. In Louvain he taught at the Cistercian house of studies but failed to secure a place at the university.

Thanks to the intercession of the papal nuncio in Cologne and the future Pope Alexander VII Fabio Chigi (1599–1667), Caramuel was named titular abbot of the dissolved Scottish monastery in Melrose in 1638 and in 1643 was also named abbot of Disibodenberg only to discover the monastery had been destroyed in war. After his trip to Disibodenberg, Caramuel spent the next few years in southern Germany (at Bad Kreuznach, Speyer, and Frankenthal) where, as a military engineer, he took an active part in defending the fortress of Frankenthal. In 1645 he became the coadjutor of the Archbishop-Elector of Mainz, and a year later, he was named an envoy of King Philip IV of Spain

Abstract

Juan Caramuel was a polymath whose contributions lie in the fields of theology, mathematics, theory of architecture, military engineering, speculative linguistics, logic, and others. His major contribution in philosophy consists in extending Aristotle’s syllogistics and creating a fragment of artificial language based on scholastic Latin encompassing sufficient resources for expressing subtle differences in the meaning of the verb “is.” There are other important advances: Caramuel expresses the theoretical foundations of a key view in moral theology, that of probabilism. In the debate over theological determinism and human freedom, he attempts to steer a middle way between the two opposing views of Molinism and Banezianism. His understanding of moral ontology, beings of reason, and proofs of divine existence is novel and original. Working within scholastic paradigm, Caramuel thus extends it in several new directions.

to Emperor Ferdinand III in Vienna. The Emperor named Caramuel abbot of the Benedictine Emmaus Monastery in Prague which was staffed by monks from Montserrat Abbey, and he assumed the role in 1647. A year later Caramuel led one of three troops of ecclesiastics in a valiant defense of the Old Town of Prague against the attacking Swedes. His treatise *Sacri Romani Imperii Pax licita demonstrata* (1648), which was commissioned by the Emperor and presented the argument that making peace with the Protestants would be morally legitimate, was an important factor leading to the signing of the peace treaty of Westphalia. However, it also alienated his long-time patron, Chigi. In 1649 Caramuel went to Vienna and afterward became Grand Vicar to the Archbishop of Prague, a title he retained until 1654. In this office he was in charge of the tribunal for the reform and reduction of heresy and favored a harsh line against Protestants consisting in imposing prison sentences, forced emigration and authorizing military occupation of private property, confiscation of property, and even the use of the death penalty (Royal Law of 1650). In 1654 he was appointed a nominee for a new bishopric which was to be established in Königgrätz (Eastern Bohemia), but the process of setting up a new diocese was slow, and opposition to Caramuel grew, so in 1655 he left Prague for Rome, with the intention of obtaining a bishopric from Pope Alexander VII (F. Chigi). In 1657 Caramuel became bishop of Satrignano and Campagna, a poor Italian diocese in the Naples region, and in 1673 he was appointed bishop of Vigevano, near Milan. In both places Caramuel set up print shops and continued writing and publishing books. He died in Vigevano in 1682.

Caramuel was an extremely prolific author who wrote some 50 works on subjects ranging from mathematics Caramuel (1669, 1678), the theory of architecture, music, and theology to logic and philosophy. This entry focuses on his work on logic and philosophy.

Heritage and Rupture with Tradition

One can say of Caramuel's philosophy that it was embedded in the scholastic paradigm of his time,

even though Caramuel seems critical of various strands within this tradition – including Aristotle himself – and his approach is eclectic (e.g., he favors nominalism in relation to the existence of universals, Thomism in the debate between theological determinism and freedom, Scotism in fundamental matters of moral principle). He expresses sympathy for other philosophical and scientific ideas of his time: alchemy, the works of Campanella, Descartes and his mechanistic philosophy, as well as the vitalism of his Prague friend Johannes Marcus Marci (1595–1667). He was linguistically and mathematically gifted, and his most innovative work relates to the philosophy of language and logic.

First, let us concentrate on Caramuel's moral thought for even here he made a striking innovation. Schmutz (2008) has shown, based on the correspondence of Caramuel with the Carmelite and Thomist Franciscus Bonae Spei (1617–1677) and other texts, that Caramuel was opposed to deducing moral conclusions from physical or metaphysical premises and was thus the first proponent of the idea that it is illegitimate to derive “ought” from “is,” stating this well before D. Hume. Caramuel followed a radical interpretation of Scotus by the Irish Franciscans of Louvain (a debate in 1643), according to which moral principles are founded on the decision of the will (divine will, human will) and not on the divine intellect. If divine will were per impossibile taken away, there would be no breach of moral law. Thus Caramuel rejected the theory of natural law in its standard form. We can see from this that Caramuel was not a moral realist like the Jesuit G. Vázquez (1549–1604), defending the notion of the intrinsic evil or goodness of some acts, but a moral positivist. For Caramuel there were no “sins in themselves” and no moral evidence; everything depended on the legal framework.

Moral ontology cannot be deduced from physical ontology. Just as there are real categories, there are also moral categories, for instance, something which is one substance physically (e.g., sheep) might be two or more substances from a moral standpoint (eating sheep flesh has a different moral quality from eating sheep's head: while the latter is allowed on a day of fasting, the

former is not). Similarly there might be four physical acts (e.g., killing four people with one blow) but only one moral act (homicide). There are also epistemic and logical differences between the way one treats moral matters and the way one deals with real objects. The role of probability will be mentioned below. Logic in moral matters is not the same as the logic of facts, so moral logic ought to be a subject of special enquiry (again, see below). These differences in subject matter and method should give rise to independent sciences of moral matters – “moral physics” and “metaethics” (speculative ethics) – which are to be considered parallel to “physics” and “metaphysics.” The need for a special science of moral entities is clear from Caramuel’s early work *Theologia moralis* of 1645 and the subsequent editions of *Theologia Moralis Fundamental* (1652, 1656, 1676). Caramuel tries to determine the proper ontological place for moral entities halfway between real entities and linguistic entities (to which status he reduces the so-called beings of reason, e.g., impossible entities such as a square circle, see below). Moral objects are not physical, but work *as if* (*ac si*) they were physical. For instance, an adoptive son functions exactly as a biological son would in certain contexts (e.g., inheritance).

Caramuel is most famous (or infamous) for his ideas in the field of moral theology. He was a staunch defender of probabilism and was called “the prince of laxists” by the well-known eighteenth-century moral theologian Alphonsus Liguori (1696–1787). Although probabilism was a theological doctrine, i.e., derived partly from the sources of faith (Holy Scripture, tradition), aspects of it have relevance even from a purely philosophical point of view; for example, the problem of what constitutes morally responsible action in the face of moral uncertainty pertains to ethics as do various aspects of moral epistemology (probable vs. certain reasons for action). For this reason it is justified to include the essentials of Caramuel’s moral theology in a study devoted to his philosophy.

Probabilism is a particular teaching in moral theology. Its theoretical foundation lies in the 1577 commentary on Aquinas’ *Prima Secundae* by a Spanish Dominican, Bartolomé de Medina

(1528–1580), who was a professor of theology at Salamanca. The doctrine concerns the question of whether, in a moral situation, a moral subject is obliged to follow a specific moral law or is free to choose action contrary to the law without thus acting morally irresponsibly or, to use theological language, committing a sin. Once again, the situation is characterized by a lack of demonstrative arguments for or against the action in accordance with the law which would produce speculative moral certitude, thus rendering one course of action certain and its contrary improbable. Only probability is conferred on the action by the argument.

Probabilism answers the question in the following way: one is free to act in conformity with the law or not provided that there are strong reasons (arguments) for the chosen course of action and regardless of how strong the arguments for the contrary action are. A somewhat more rigorous solution, probabiliorism, takes into account the reasons for the contrary action and requires one to act in conformity with the stronger reasons, in other words to take the more probable of the two courses of action. In cases where the reasons are equal in strength, one is obliged to follow the law. A more rigorous position in relation to probabiliorism and probabilism on a scale of being rigorous, tutiorism, favors the action according to the law over the action contradicting it and asks one to follow the “safer path” regardless of the strength of the arguments for the other course of action. In practice the problem was usually posed in the form of a question as to whether one can disregard a particular moral obligation and act contrary to the law constituting the obligation without sinning. One can simplify matters and say “yes” provided there is a strong reason for doing so (probabilism), “yes” on condition that the arguments for acting in contravention of the law are stronger than those against (probabiliorism) or, finally, “no” (tutiorism).

One can distinguish several stages to Caramuel’s thought on probable opinion. The texts most relevant to the early phase of his thinking can be found in *In Divi Benedicti Regulam* (1640) and the first edition of *Theologia Moralis Fundamental* (1652). The so-called

Fundamentum II, which was progressively elaborated in later editions of the latter work, represents a kind of transitional stage. Before summarizing Caramuel's arguments in favor of probabilism in these works, let us note that they constituted the basis for much of the criticism leveled against Caramuel in subsequent decades and centuries. This is because some of Caramuel's formulations lend themselves to misunderstanding as Caramuel was not as cautious in his wording at this time as he was in later years.

Caramuel accepts the common distinction between two types of probability in relation to a course of action, the "authoritatively (*authentice*)" probable and the "rationally (*rationaliter*)" probable. While the former is based on the authority of learned men and comes from without (*ab extrinseco*), the latter is based on argument and is thus intrinsic. An opinion (concerning action) is intrinsically probable if there is a strong (but not demonstrative) argument supporting it and responses to the major objections which can be raised. If this is not the case, the opinion is intrinsically improbable. The (primary) truth of a proposition and its probability (secondary truth) are two different things. The latter is an epistemological notion: the proposition seems true regardless of whether it actually is true. Although a proposition and its negation cannot simultaneously be true, they can be simultaneously probable. The probability of a proposition is subject relative (what is probable for one subject, can be certain or improbable for another) and can change over time based on changes in the subject's epistemic state. Thus education is needed to assess intrinsic probability, and the opinion of learned persons serves as evidence, from an external epistemic source, of intrinsic probability. Caramuel refuted the received view of his time that four authorities suffice to make a view probable. According to him, since at least four authorities attest that one authority is sufficient to make a view probable, one doctor suffices. His most extensive discussion of extrinsic probability is to be found in *In Divi Benedicti Regulam*; in later works such as *Theologia Moralis Fundamental*, the emphasis shifts to intrinsic probability.

Caramuel's major argument against probabiliorism is that the acceptance of probabiliorism commits one to probabilism: one is to follow the more probable opinion, but probabilism is more probable than probabiliorism; ergo one ought to follow probabilism. One of the main reasons why probabilism is more probable is that it enables more people to follow a safe path and avoid sin. Given that following a rule might be harder than not following it due to human frailty and that probabilism licenses the latter course of action more often than its more rigorous counterpart, probabiliorism, more people avoid sin if a probabilist view is taken. Caramuel opposed Libert Froidmont of Louvain who was a rigorist (tutorist), and *In Divi Benedicti Regulam* (disp. 6, a. 3, pp. 27–28) contains a response to him. Similar material is to be found in *Theologia regularis* (published in Bruges 1638, disp. 6, a. 3, pp. 26–27 in 1646 edition). In Froidmont's view one should follow the safer path, which, according to him, means following the moral precept (even if its binding force in the particular situation is disputable) rather than ignoring it, although the latter is usually the less demanding course of action. For Caramuel, however, the "safer" course is the one "more likely to be undertaken without failure." This relates to one of Caramuel's controversial statements which attracted heavy criticism on the grounds that probabilism made it possible to follow, without sinning, certain courses of action which would previously have been considered sinful. Similarly, the dedicatory epistle to another probabilist, A. Diana, in *Theologia Moralis Fundamental* (1652) states that some courses of action, previously sinful, lost this stigma through becoming probable. This latter statement is criticized by, among others, B. Pascal in *The Provincial Letters* (1657, Letter VI of April 10, 1656). What Caramuel means by such admittedly ambiguous statements is that choosing an action perceived as probable in the given circumstances (either on the basis of one's own reasoning or according to authority) and choosing the same action in the absence of such a perception have different moral implications: the latter choice is wrong, while the former is not. This argument becomes much clearer in the second, transitional

stage of his work on probable opinion. Probabilism was linked to the formal Roman condemnation of two sets of laxist moral positions in 1665–1666 and 1679.

The next stage of Caramuel's thought on probabilism is represented by the *Apologema*, a response to Prospero Fagnani's rejection of probability as sufficient grounds for a licit course of action (P. Fagnani, *Commentaria in Primum Librum Decretalium*, first edition 1661, c. 5, no. 44ff, p. 34ff). After publication, the book was consigned to the Index of Forbidden Books. Both Froidmont and Fagnani emphasized that probabilism was a recent doctrine, and in the *Apologema*, Caramuel takes great pains to argue that reliance on probable opinion has been widespread since biblical times. He sets probable opinion halfway between certitude and complete ignorance. Thus probable opinion does involve some (invincible) ignorance. A probable opinion may prove to be incorrect (uncertainty in relation to the object), but this would not undermine the legitimacy of an act based on that opinion (there is no uncertainty in relation to the act). Invincible ignorance makes one's act at most hypothetically sinful (based on the hypothesis that there is such a law), not formally sinful, nor even materially so. There is no material sin: an uncertain law is like a law which is not promulgated, and such a law is in fact no law at all (Aquinas, Suarez). In the *Apologema* Caramuel addresses the relationship between extrinsic and intrinsic probability. Extrinsic probability, based on authority, cannot be established if the contrary view is certain. It is difficult to determine the strength of extrinsic authority as not all authorities are equally authoritative. It is equally difficult to judge the degree of probability of a given opinion based on arguments (intrinsic probability); hence, for practical purposes, it is probability as such which makes an act legitimate or morally secure, not the strength or degree of probability. Intrinsic probability is subject relative: an opinion on action is intrinsically probable for a subject S, if there are strong arguments supporting it and if the subject S is capable of understanding and assessing them and if in fact assesses them to be strong. In the later editions of *Theologia Moralis Fundamental*

Caramuel claims that unlike the ignorant person, the learned person has a moral duty to rely on intrinsic probability.

If one or more of the above conditions are not present, the subject should base his or her judgment about probability on external authorities, who thus substitute for the missing conditions. If the conditions are fulfilled, S sees that the opinion is probable, i.e., supported by a strong argument (intrinsic probability), whereas if they are not, S hears that the opinion is probable (extrinsic probability). Extrinsic probability of a certain opinion acts as evidence for its intrinsic probability but in no way creates it, as intrinsic probability derives solely from strong arguments regardless of who supports the opinion.

The final stage of Caramuel's theoretical perspective on probable opinion emerges in the *Dialexis de Non-Certitudine* (1675) and the Fundamentum II of *Theologia Moralis Fundamental* (1675–1976 edition). In these works the formal reason for an act being morally justifiable is not its probability; instead he states a more general reason which applies to probable actions and to morally certain ones: the non-certitude of the contrary act. In other words, it cannot be certain that the opposite act is to be performed and hence also certain that the act under consideration should *not* be done. Also, both moral certainty and probability are based on strong arguments; what distinguishes the former from the latter is the absence of strong arguments in support of the contrary view. Only certainty in relation to a law creates moral obligation rather than probability. Just as one remains in possession of a certain property until it is proved otherwise and one is deemed innocent until proved guilty (the principle of possession), freedom takes precedence over law for Caramuel. Liberty can be constrained only by a (certain) law. If the obligation stemming from the law is not proven, the law does not bind. What is not forbidden by law is licit. As in *Apologema*, a person cannot formally or materially break a law of which he or she is ignorant as it is not a law for that person. There does not have to be any special, strong grounds for considering a view probable apart from the general reason that one remains in possession of

liberty unless one is certain of there being a law constraining it.

In 1972 the Italian Dino Pastine published Caramuel's *Animadversiones in Meditationes Cartesianas*, Caramuel's response to Descartes's *Meditations* (first published in 1641). This was a lengthy manuscript, written in 1644, that Pastine had discovered in the Vigevano archive (*Archivio capitolare*). According to Baillet (1691, pp. 209–210), Caramuel asked Descartes for a response and permission to publish the *Animadversiones* with Descartes's reply in correspondence. Descartes agreed, but Caramuel never sent him the *Animadversiones*.

A few points from Caramuel's criticism are worth mentioning. In the Third Meditation, Descartes proves the existence of God on the grounds that his idea of an infinite being he has in his mind must have come from such a being and not from a finite cause. Caramuel objects that the idea of an infinite being is inconsistent. Inconsistent ideas do not have any being apart from being linguistic entities (*ens linguae*); hence, the idea needs no cause. The idea is inconsistent because the concepts of being and finiteness are coextensive: any being is finite and vice versa. Why? Because an infinite being, a whole consisting of entities or properties (formalities, perfections), would violate three evident principles based on natural reason: (1) A whole is greater than its parts. (2) The remainder resulting from subtracting a part from a whole is smaller than the whole. (3) In a multitude, the number of singles is greater than of the number of pairs, which in turn is greater than the number of triples, the latter of quadruples etc. But part of an infinite whole is also infinite (which violates 1), the remainder is also infinite (which violates 2), and the number of singles, pairs, triples, etc., is equal, namely, infinite (which violates 3).

Descartes' proof of the divine existence in the Fifth Meditation is based on the idea that a perfect being has an essential existence just as a triangle is essentially three sided. According to Caramuel, however, essential properties are conditional on the assumption that the object to which they apply exists. This means that if there is a triangle, it necessarily has three sides. By analogy, if there

is a God, He necessarily exists. The assumption of existence, however, is not granted by the atheist.

In the Sixth Meditation, Descartes attempts to prove that there are external material things on the grounds that he has ideas about such things and that he has a strong inclination to believe they are produced by external things. Since the inclination is given by God who cannot deceive, the inclination is not deceptive. However, according to Caramuel, we do not know whether the idea is produced from without or is inborn, nor do we know the manner of production. God cannot deceive, but we can make errors when using our epistemic capacities. Errors arise not only from inadequate use of the capacities, as Descartes observes, but also from invincible ignorance. The fact that God cannot deceive does not imply that He must give us either infallible capacities or the capacity to correct our fallible capacities. Not deceiving is different from giving fallible capacities.

In criticizing Descartes's first proof of divine existence from the Third Meditation, Caramuel referred to inconsistent ideas as linguistic entities. To such a status, Caramuel reduces what other scholastics considered beings of reason (*entia rationis*). A treatise on beings of reason is to be found in a late work entitled *Leptotatos* (1681) (*Leptotatos*, Dissertatio II Philosophica, pars II, a. 1 and 2, pp. 89–118). Impossible entities (such as, for Caramuel, infinite beings) are beings of reason. For Caramuel (as for some Jesuits before him, see Novotny 2008) the reverse is also true: all beings of reason are impossible entities. Such entities cannot exist in reality, but according to Caramuel, they do not exist in the mind either, as they cannot be conceived. Caramuel rejects the argument that if one asserts that a being of reason does not exist in reality, it has to exist in the mind. According to this argument, if one denies that a being of reason, say a square circle, exists, one first produces the being of reason by thinking (conceiving) and then denies its existence. Caramuel instead maintains the following: one first thinks of a circle and then asserts that if the circle were a square, it would be a being of reason. But as the antecedent is false – the circle is not a square – the being of reason is not conceived.

From this there follows a proof of divine existence. Since one does not conceive impossibilities, whatever one conceives thus exists either possibly or actually. God is conceived by humans; therefore, God is either possible or actual. But God cannot be merely possible. Hence, God is actual. For Caramuel, beings of reason are merely entities of language, juxtapositions of words. This position he held since Caramuel 1642. Only in this sense they can be said to be part of reality.

While discussing arguments for divine existence in *Leptotatos*, Caramuel presents a modal proof for divine nonexistence (*Leptotatos*, Dissertatio III, Theologica, a. 1, pp. 193–215). The proposition “nothing exists” is obviously false, but it does not seem to be impossible (necessarily false). If it were impossible a contradictory statement would be derivable from it. Such a statement would have to be positive as the contradictory of a negative statement (“nothing exists”) has to be positive. But one cannot deduce a positive proposition from a negative one. So “nothing exists” is false but possibly true. If it were true, God would not exist (as God is something). But a God who could not exist is contingent and therefore no God at all. So God does not exist.

Caramuel finds the following fault in this argument: if nothing exists, the proposition that nothing exists also does not exist, but remains at least possible. If it is possible, it is a knowable truth. If it is a knowable truth, there has to be something which could know it, and that something is God. Hence God exists. Hence the truth of “nothing exists” implies that something exists, namely, God, which is a contradiction. The *Leptotatos* contains an extensive correspondence on the matter with A. de San Pedro, A. Mendo, and P. Symphronius.

Caramuel presents the proof as an example of use of his philosophical language. Caramuel’s thought exhibits a constant, multifaceted interest in language in general and artificially constructed language in particular. He occupied himself with the art of cryptography. In *Steganographiae Ioannis Trithemii Genuina Declaratio* (1635), he gives an explanation of the cryptographic method of the German Benedictine abbot Johannes

Trithemius (1462–1516) contained in his *Steganographia* (written c. 1499, published 1606) which was added to the *Index Librorum Prohibitorum* in 1609 as it appeared to contain elements of magic. Caramuel commented on Trithemius’s text and thus helped to disseminate Trithemius’s ideas although the monograph was banned. The art of cryptography consists of replacing symbols of one language with another with the help of an encryption key. A universal key would be capable of encoding any language into a universal language.

Caramuel, who allegedly had some knowledge of 24 languages, took an interest in the idea of a universal language. He corresponded with A. Kircher about the version of a universal language outlined in Kircher’s *Polygraphia nova et universalis ex combinatoria arte directa* (1663) (letter dated August 4, 1663).

Another idea is that an artificial language could be constructed directly, without reference to any natural language. Such a language would capture the world directly and encode its structure. The idea comes from Francis Bacon (*De Dignitate et Augmentis Scientiarum*, 1623). The language, consisting of so-called real characters, could be translated into natural languages similarly to the symbols of mathematics. Some such real world signs are natural, some artificial. In the seventeenth century, there was a widespread, false supposition that Chinese pictorial script consists of such natural signs. Caramuel dealt with the idea in the third volume of his *Apparatus Philosophicus* (1665), which also was devoted to the classification of sciences, both those in existence and those Caramuel thought should exist (first volume). Before one can construct an artificial language, one has to undertake the philosophical task of outlining the structure of reality. Caramuel calls such signs *ciphrae*, ciphers. They denote parts of the world. Ciphers themselves can consist of meaningful parts. The smallest element endowed with meaning is a *nota*. These notes would be written characters or signs. Caramuel’s sign language captures the tree structures of the ten Aristotelian categories. The inner structure of the categories, only briefly described by Caramuel, differs to some extent from what was traditional.

By giving these notes, Caramuel provides the dictionary of the language. A graphic sign indicates a category and a particular place within it. The basic sign is a square which means “being.” The pattern of lines within the square indicates the particular category and the place within the category to which a being belongs. God does not belong to any category, and it is represented by a triangular sign. The grammar of the language resembles that of a natural language. In order to eliminate prepositions, there are ten nominal cases. There are two numbers for nouns, and verbs are affected by mood. Graphically, grammatical categories are represented by commas placed just outside the squares. In appearance, Caramuel’s written sign language bears some resemblance to Chinese script; however, Caramuel, who was acquainted with Chinese through Fichinpai, a Portuguese-speaking Chinese native he met in Vienna in 1654, showed in his *Apparatus* that Chinese script does not consist of real characters. In *Apparatus* he presents an outline of Chinese grammar.

Caramuel’s contribution to the language of real characters appeared between the rather well-known works of G. Dalgarno (*Ars Signorum*, 1661) and J. Wilkins (*An Essay towards a Real Character and Philosophical Language*, 1668).

A third approach to language which was common in the seventeenth century is the attempt to construct an ideal philosophical language by revising the grammar and lexicon of a natural language, often Latin. Caramuel outlined his speculative grammar in *Grammatica Audax* (1655) but devotes more space to it in *Leptotatos*. He calls his language “metaphysical dialect” (*dialectus metaphysica*). His objective was to revise scholastic Latin to create a language with sufficient expressive resources for the science of metaphysics. The idea was to enhance the expressive power of Latin and dispel the ambiguities. The central task was therefore to eliminate the ambiguity of the verb “to be” (*esse*) and add new meanings of “being” used by various schools of scholastic philosophers. These days it is customary in philosophy to distinguish three senses of the verb “to be.” It can either express existence (e.g., “God exists”), identity (e.g., “Cicero is Tully”), or

predication (e.g., “the table is round”). Caramuel, a nominalist in relation to the existence of universals, reduces the third sense of “to be” (predication) to the second, namely, to identity. Thus, for him “the table is round” does not express the predication of a general property of roundness of the particular table denoted by the subject expression “the table”; rather it expresses an identity between the table in question and a thing denoted by the word “round.” Besides identity, the copula “to be” also expresses a particular sense of being belonging to the subject, e.g., table. Here it is clearly real existence in the present. In order to capture this sense of existence, Caramuel coins the verb form “sere” (conjugated “sem,” “ses,” etc., with the present participle being “sens”) with the meaning “to exist now,” replacing *esse* in the sentence. Caramuel distinguishes four other basic types of existence in addition to this (*Leptotatos*, *Dissertatio I*, *Meta-logica*, a. 11, pp. 37–59):

1. “Sare” (conjugated “sam,” “sas,” etc., participle “sans”)

This meaning of “to be” relates to the being of essences and its parts (*esse essentiae*). For instance, “is” as in “the whale is a mammal” would be rendered by this form. Such statements would be true even if no whales existed in reality.

2. “Sere” (conjugated “sem,” “ses,” etc.)

For example, “Peter exists,” meaning “exists in the present”.

3. “Syre” (“sym,” “sys,” etc.)

This form means “to have a simultaneously existing eternity” which is a type of being pertaining to God only (e.g., “God exists”).

4. “Sore” (“som,” “sos,” etc.)

In this sense, only the Aristotelian prime matter exists. Being a physical constitutive principle, it does not have its own act of being. In being actualized by some substantial form, a composite of matter and form (itself said to exist in sense 1) receives the act of existence and thus exists in sense 2.

5. “Sure” (“sum,” “sus,” etc.)

This sense of real existence abstracts from a particular point in time and means “to exist at

some time or another": e.g., "The Antichrist exists." In contrast, "sere" is essentially tied to the present.

From these basic verbs, Caramuel constructs yet further forms. The insertion of "m" is used to produce a factitive form in the sense of "produces the particular type of being" (*Leptotatos*, Dissertatio I, Metalogica, a. 13, pp. 65–72). Thus *samere* means "to produce essence." This action pertains to God. For instance, Scotus and his followers maintain that God produces essences of possible beings through his intellect. In this context the word "produces" should be represented by the form *samit* according to Caramuel. The meaning of *semere* is clear: an efficient cause produces an effect in real being, here and now. We know that "syre" applies to the mode of divine being only: "The Father and the Son *symunt* the Holy Spirit" (i.e., "the Holy Spirit proceeds from the Father and the Son").

On the other hand, the insertion of the vowel "i," resulting in "saire," "seire," "syire," etc., weakens the particular mode of existence (*modos essendi imperfectos*) (*Leptotatos*, Dissertatio I, Metalogica, a. 12, pp. 59–65). Thus the first two mean "exist in intentional being only." Something exists in the intentional mode if it is present in the intellect as known. "Syire" means "exists as created from eternity." For instance, if the world is eternal (a subject of dispute among medieval scholastics), then the world "is" in this sense.

Altogether there are fifteen forms of the verb "to be" in the existential sense. Caramuel believes that such a dialect is needed, and one of the examples of its utility is its use in the counterargument against the modal proof of divine nonexistence given above. If "nothing exists" ("set"), then there is a contradiction. The claim that "nothing exists" remains possible ("sat"), even though it does not exist ("set"). In being possible ("sat") it is knowable. Hence, there is something ("set") with the capacity to know.

Another application of Caramuel's dialect can be found in *Grammatica Audax* (Pars III, Med. IV, a. 5, p. 117ff). The issue at stake is the various modes of being of essential features in general and the ontological status of the possible entities, in

particular their being and relationship to God. Caramuel invites the reader to carry out a thought experiment: suppose that there is a certain being, a mind, whose existence amounts to thinking (pronouncing within himself) all the different letters or characters that there are or that there could be. Let us further assume, for simplicity's sake, that there are only a limited number of these characters, e.g., the twenty-five uppercase letters of the Latin alphabet in use in Caramuel's time. Now this mind, called *Abecedarius* or "Alphabet" by Caramuel, is a simple entity constituted by all the aforementioned characters which are really identical in him. While Alphabet exists by pronouncing all the characters of the Latin alphabet within himself, externally he pronounces or speaks only some of them. Now let us take a certain statement made by Alphabet, for example, "sum" ("I am"), and explore the various different ways it, and the characters constituting it, can be considered. There are four: the first, fairly obvious, way to take the characters – based on what has been said about Alphabet – is to consider them a real part of Alphabet himself, identified with all the remaining characters. Secondly, it can be said that Alphabet pronounces the characters *ad extra*, thus making a statement (*dictio*), so one can take the characters in this replicated form as being different from all the rest ("replicated" meaning that there is no loss of a character in the mind when the character is spoken out loud). In this form the statement is really distinct from the speaker. Another way to interpret the statement is to view it as externally replicable and really distinguishable from the speaker, in other words as pronounceable and, in short, possible. Finally, when one considers the characters in abstraction from their ontological status, i.e., from their being identified within Alphabet or distinct when pronounced externally, they can be seen in themselves (*secundum se*) as they appear both in Alphabet and in the external statement.

In this thought experiment Alphabet stands for God. The characters, e.g., perfections (attributes), combine into statements, i.e., creatures and things. One can consider the perfections and the creatures constituted from them in the same fourfold way as the characters and statements above. God is in

Himself all perfections, the merely possible as well as those existing in created things; however, only some of these perfections are combined by Him into creatures which are really distinct from Him. Just as it makes sense to speak of a statement being pronounceable or possible only in relation to the speaker's power of pronouncement, it also makes sense to speak of possible creatures only in relation to God's creative power. Hence, the important conclusion that Caramuel draws from the analogy is this: before the creation of the world, before God's creative potency, there was nothing, neither any of the ontologically weaker things (the *entia diminuta* of the Scotists), nor essences, nor even any possible entities that were really distinct from God. The Scotists, according to Caramuel, are not wholly off the mark; however, neither are they open to the objection that they introduce a kind of being which exists independently of God. Rather, they express themselves in a misleading way. A better way of capturing the distinction they have in mind is to say that the possible entities are (*sant*) in the sense of having their essential predicates and being capable of being created by God, instead of saying that they are (*sunt*) in the sense of being real at some time or other.

In this context and elsewhere, Caramuel invokes the idea of a possible world whose introduction into philosophy is popularly associated with G. W. Leibniz. Caramuel notes a striking parallel:

whoever could see through and comprehend the essence and combinations of the Alphabet, would understand all languages and books, those written as well as those capable of being written . . . whoever could rationally apprehend (*intueatur*) the essence of God, would understand not only this world, but all possible worlds. (*Grammatica Auda*x, Pars III, Med. IV, a. 6, p. 119).

Writing about human and divine knowledge of possible entities in *Metalogica* (part of *Theologia rationalis*, Frankfurt a. M. 1654), Caramuel draws yet another analogy between linguistic characters and aspects of reality, this time not perfections but entire possible worlds (Liber X, Thesis I, p. 190ff). He states that there are three kinds of knowledge about possible entities: By *scientia*

simplicis intelligentiae, one can know that, for instance, *a*, *e*, *i*, *o*, and *u* are possible characters. By *scientia conditionata*, one obtains a conditional knowledge: if one were to move a pen this way or that, this or that character would be produced. Finally, by *scientia visionis*, one knows a particular decision of the will and hence future things, i.e., which characters will be written down. Turning now to God's knowledge of possible entities: divine knowledge parallels that of man. Caramuel states that by the first type of knowledge, *scientia simplicis intelligentiae*, God comes to know the five possible worlds (*mundos possibiles*), *a*, *e*, *i*, *o*, and *u*. Then (in a logical, not temporal sense) He selects *e* and creates it. Using the third kind of knowledge, He reflects on the decision of His will and observes that *e* is or will be realized whereas *a*, *i*, *o*, and *u* will not.

There is a third analogy in *Metalogica* which uses linguistic characters (Liber X, Pars II, Thesis VIII, p. 74). This time the characters are compared to individual possible beings (humans): when God wanted to create Adam, A, He first came to know, by *scientia simplicis intelligentiae*, a great number of people whom He could have created had He so wished: B, C, D, etc. By the same act of knowing by which He knows A, He also knows the whole of A's posterity. Since effects become individual through their causes, no descendant of Adam could have been created by any descendant of B and vice versa. By choosing A, God relegated B, C, D, etc., to the ranks of the purely possible which would never become actual. Yet Adam sinned, and the original sin afflicts all of his descendants, actual as well as merely possible. The sin does not afflict the descendants of B, however, so God chose the Virgin Mary, the mother of God, who as theology says was exempt from the original sin, one of B's possible descendants, and miraculously implanted her among the descendants of Adam.

One of the analogies above invoked *scientia conditionata*, the Molinist "middle knowledge," and the reader may be wondering what Caramuel's stance was on one of the most vexing problems of early modern Catholic philosophy and theology, that of human freedom and theological determinism. Caramuel's approach to this

matter underwent substantial development over the years. We see this first of all in two sets of theses on the matter which he defended a decade apart in his earlier days. Secondly, these theses were subsequently reprinted in other works, namely, *Metalogica* and *Theologia moralis fundamentalis*, accompanied by an ever-increasing number of notes which testify to his intellectual development in this area. One can distinguish at least three stages to Caramuel's thinking, which together amount to an attempt to find a middle way between Thomism and Molinism.

Stage one finds its expression in the Salamanca theses of 1630: *Physicae Praedeterminationes Infallibiliter et Non Necessitantes. Inventae et Defensae Sunt ab Authore Salmanticae Anno 1630* (*Metalogica*, Lib. X, pp. 154–161). As is clear from their title, Caramuel tries in these theses to rescue Thomist teaching from the charge that it destroys human freedom. He does this by drawing a sharp distinction between the concepts of necessity and infallibility. In essence, Caramuel attempts to show that physical predetermination, i.e., *premotio physica*, does not necessitate the act for which it is given, but makes the occurrence of the subsequent act de facto – i.e., in the actual world – “infallible,” which means always the case. Predetermination necessitating the act would destroy freedom, because it is incompatible with the ability to resist the act required by any true freedom. However the concept of predetermination as leading to an infallible act is compatible with resistance and therefore does not destroy freedom. Moreover, infallibility also suffices as an explanation for God's knowledge of the future.

In order to be compatible with freedom, the premotion must allow resistance. Hence, according to Caramuel, a particular premotion is given not only for its act, e.g., A, but also for its negation, non-A, at the very same time but in a different, i.e., non-actual modal context. There are two senses in which one can speak about the effect of a particular premotion: *simpliciter* and *modaliter*. In the first sense, *simpliciter*, a premotion may fail to produce its effect – although in fact it does not – because in a possible, but non-actual world, there exists a negation of the

effect A, non-A, which is regarded as the absence (*carentia*) of the effect A, rather than as some positive effect B which is incompatible with A. In the second sense, *modaliter*, the notion of effect is taken to encompass both act A and its negation in some non-actual world. In this sense, premotion can never fail in producing its effect. Hence, in one sense (*simpliciter*) a premotion can exist within a possible world – possible modal context – without the positive act, i.e., the effect for which it is given. Caramuel thus accepts that there *can* be nonproducing premotions and hence that resistance is possible, but in fact there *are* none, because the absence of the act is never actual given a certain premotion. The latter is what infallible connection means.

The middle stage of Caramuel's thought is related to the Louvain theses of 1641 (*Theses Theologicae De Gratia et Libero Arbitrio ad Mentem Mellistui Doctoris Decretis Tridentini Concilii Confirmatam* and a somewhat different later version *Theses Theologicae De Gratia et Libero Arbitrio: In Quibus Demonstramus Doctrinam Illustrissimi P. Didaci Alvarez Archiepiscopi Tranensis et Salpensis, ex Doctissimo Ordine PP. Dominicanorum Assumpti, Esse Eamdem, Quam Hodie Solent in Scholis Suis Defendere Patres Iesuitae Metalogica*, pp. 161–171). In these theses he regards his previous solution to be the real sense of the solution defended by Thomists (in the Salamanca theses, he argues that Thomists *do not* but *should* defend this solution). He expounds his original theory in the context of Diego Alvarez's (1550–1635) writings, claiming that he has found the correct interpretation of Alvarez's teaching, which is opaque in its formulation. Caramuel uses Alvarez's insights to enrich his own theory, arguing that if we add to the relationship between premotion and the act of the human will a connection between the decree of the will of God and the act of the will of man, then it is correct to say that it is not possible that the decree of the will of God should will that man decides something or other and the will of man not will accordingly; however, it is possible to have predetermination of this act (promotion) combined with its absence. This is because God wills man to

decide freely, and if this were not possible – i.e., predetermination of an act combined with its absence – then human acts would not be free and God's will that it be so would be frustrated.

In the second version of the theses, Caramuel optimistically considers the Thomist and Jesuit solutions to be the same at heart, differing only in their linguistic formulation. He thinks that the Jesuits should accept Thomist theory as true because it rescues both predetermination and freedom. It follows that as saving freedom is the goal for which the Jesuits originally devised their theory of middle knowledge they should abandon it, for it is actually superfluous.

Caramuel presents further arguments as to why the Jesuits should accept Thomist teaching: if it is admitted that it is at least possible that physical premotion is not destructive of freedom, then it is at least possible that middle knowledge does not exist in God. Hence, the possession of middle knowledge is contingent and cannot constitute a divine attribute, because all attributes of God are necessary. While the Jesuits think that determination in general destroys freedom, their theory has it the other way round: human will determines divine will and thus destroys God's freedom, and so Jesuits should accept the Thomist teaching of physical predetermination which does not destroy freedom.

Caramuel regards the Molinist teaching on middle knowledge as useless (*Metalogica*, Lib. X, *Theses theologicae De omniscientia et omnipotentia*, thesis VI, p. 195). Both Thomists and Molinists agree that one can distinguish logical phases *prior to* and *posterior to* the act of the divine will, i.e., divine decree. The Thomists and Molinists differ, however, on the issue whether conditionals of freedom are absolutely true or false before (prior to) or after (posterior to) the act of the divine will. Caramuel seemingly agrees with the Thomists that they are true or false only after the act, but he understands “before” and “after” differently. He does not think one can distinguish these logical phases in God, so he takes “prior” or “before” to mean “in abstraction from” the divine decree. Hence, prior to, or in abstraction from, the decree of God that these conditionals are neither true nor false, they lack

truth value and hence are unknowable. That which is unknowable does not threaten or destroy God's omniscience, because it cannot be known. Also, after the act of the divine will, only those conditionals are true which correspond to absolute future contingent events, not all such conditionals (in this he differs from both Thomists and Molinists).

In *Leptotatos* (1681) (Dissertatio III, Theologica, a. 5 “De Scientia Media,” pp. 271–276) Caramuel argues against middle knowledge in the following ways. First he argues indirectly, defending the Thomist account (that of Cabrera, John of St. Thomas, Nazario, Zumel, and others) of divine foreknowledge of conditional future contingents against misrepresentation by some of the Jesuits (Vázquez, Martinon, Amico, Alarcón); his second argument is direct, presenting two arguments against middle knowledge, one a priori and the other a posteriori. Only the first is presented here as the second is theological.

As we have seen, in *Leptotatos* Caramuel devised a special vocabulary so that confusion and ambiguity could be avoided in subtle scholastic debates. While possible beings, *sant*, created real beings either exist now, *sent*, or at some time or other, *sunt*. Possible beings are necessary and exist prior to the divine decree (though it is nevertheless God who confers their existential status on them), whereas created beings are contingent and exist as a consequence of the divine decree. If there were conditional future contingent entities, their being would be somehow intermediary, these beings *saent* (would possess *esse intermedium*). Existential status or being of any of these types (*sare*, *sere*, *sure*, as well as *saere* if it exists) must be received from God. The question now is the being of the conditional future contingents, *saere*, conferred before or after the decree? If they are objects of the putative *scientia media*, conditional future contingent entities must exist prior to the decree, because this knowledge precedes it. However, this makes them necessary, not contingent or free, apparently because their being is conferred “automatically” (by being known), independently of the divine will. So, one can prove a priori, observes Caramuel, that there can be no such objects (non-necessary conditional

future events prior to God's decision) and hence no such knowledge.

In the third and final stage, Caramuel rather pessimistically regards both the Molinist and Thomist solutions to the problem of divine determinism and freedom as wrong and advocates a return to what might be considered the original sources, namely, Augustine and especially Thomas Aquinas himself. Now he once again interprets the Thomists as advocating the strict version of the theory of predetermination based on the identification or confusion of necessity and infallibility. This becomes clear from notes he adds to the reprints of his earlier theses in the 1676 edition of *Theologia Moralis Fundamental* (p. 22, 24). Similarly, when reprinted in this edition of *Theologia Moralis Fundamental*, the *Meta-logica* theses which are critical of middle knowledge – *Theses Theologicae De Omniscientia et Omnipotentia* – are expanded and entitled *Neutrum*, neither, to indicate his opinion that neither theory works (Thesis VI, pp. 52–59). Hence, it is clear that Caramuel later rejected the solution he proposed in the Salamanca and Louvain theses.

It should be noted that the late work *Leptotatos* (1681) constitutes something of an exception to this pattern, for in *Leptotatos*, as we have already seen in the case of middle knowledge, Caramuel presents doctrines from the first or second stages of his thought (adherence to Thomism). This is also true of physical predetermination, where he presents ideas from the first stage of his thinking. I think this can be explained by his overall goal in this work, which was to devise a technical vocabulary for dealing with subtle philosophical and theological issues which avoided vagueness and ambiguity. In order to devise the language and prove its worth, he returns to some of his earlier doctrines.

Innovative and Original Aspects

Caramuel's chief contributions to the field of philosophy lie in the philosophy of language and in formal logic. His "metaphysical dialect" has been already introduced above in the context of his

other preoccupations with language. Now let us briefly outline Caramuel's logic. His major work on logic is *Theologia Rationalis*, an anthology which brings together several more or less independent logical treatises, some of which were published separately prior to 1654 or later. *Theologia Rationalis* escaped the attention of logicians, no doubt due to its misleading title, *Rational Theology*. Caramuel's original title, *Philosophia Rationalis*, which was more appropriate to the content, was changed by the printer, as Caramuel reports in the printed list of his works composed in Vgevano.

Theologia Rationalis consists of two main parts, *Praecursor Logicus* and *Metalogica*. The former comprises several parts: *Grammatica Audax* has been already discussed, *Logica Vocalis*; *Scripta et Mentalis* takes logic to deal primarily with language rather than concepts, which is clearly a sign of a nominalist approach. The formal organization of logical matter according to the level of language – spoken, written, or mental – appears to be novel. Another part of *Praecursor Logicus*, an independent treatise called *Logica Obliqua*, constitutes a truly original contribution to the field of formal logic. It presents the logic of binary relational statements at the levels of proposition (Part I) and argument (Part II). The specific advance this logic represents over standard syllogistics is explained below. The final part of the *Praecursor*, "Three Logical Labors of Hercules, the Logician," *Herculis Logici Labores Tres*, is a set of three studies devoted to logical problems. The first labor, which is called *Nilnegans* ("negating nothing"), is a reduction of the system of valid moods of the syllogism. In essence it reproduces Caramuel's bachelor thesis from Alcalá on so-called infinite logic. The idea is to eliminate copula negation in favor of term negation (negated terms are called "infinite"). The second labor, entitled *Non-omnis*, is based on the observation that in Latin "non omnis" ("not every") does not solely express the negation of a universal affirmative statement (which is obviously equivalent to the particular negative), but is equivalent to the conjunction of a particular negative and a particular affirmative. Caramuel

explores this idea and demonstrates the logical properties of statements containing the expression “non omnis”: equivalences and oppositions of these statements as well as valid moods of syllogism. Last but not least, the third labor, *Contingens*, is a systematic treatment of modal logic based on the by now familiar idea that the modal “contingent” is not equivalent to “possible,” but “possible and possible not.”

The second part of *Rational Theology, Metalogica: Disputationes de Logicae Essentia, Proprietatibus, et Operationibus Continens*, is a set of treatises (books) in the fields of the philosophy of logic (Book I), philosophical logic (Books VII and IX), metaphysics (Books II, III, IV, V, VI, VIII, and X) and informal logic (Book X). The topics dealt with range from the nature of logic, the theory of proposition, and semantic paradoxes to issues of metaphysical kind (rational entities, universals, individuation, self-evident principles, etc.). Book X, *De Severa Argumentandi Methodo* (published independently in 1644), is the most extensive; its content ranges from informal logic to applications of logic to specific problems in philosophy and theology.

What is “metalogic” and why, according to Caramuel, is it needed? Caramuel draws a parallel between logic and music: both direct sound but for different purposes. Just as knowledge of the production of musical sound (music) depends on musical theory (“metamusic”), knowledge of the production of language sounds (whose goal is the discovery of truth), logic, depends on metalogic. Hence metalogic is logical theory. In contemporary terminology Caramuel’s metalogic encompasses the philosophy of logic, philosophical logic, and parts of metaphysics. Alternatively, metalogic is, for Caramuel, “metaphysical logic” dealing with topics at the intersection of logic and metaphysics.

Caramuel, who was a famous moral theologian, also dealt with logic in moral and legal argument. There are two works devoted to the topic: *Pandoxion physico-ethicum* (“physico-ethical summary of belief”) (1668) and somewhat extended treatment in *Moralis seu Politica Logica* (“moral and political logic”) (1680). The nature of

legal argument prompts Caramuel to analyze the scale or gradation of natural language quantifiers and to focus on certain aspects of epistemic logic. What one finds in moral or legal argument is very often an inference from a statement in which less than all members of a certain class are subject of predication to a statement whose truth is consequently only more or less probable. The so-called *sylogismus iuridicus seu moralis* consists of a general major premise which states some moral or legal norm (*ius*) and a singular minor premise which states some fact (whose truth is to be proved by the accusant at the trial). The conclusion, also singular, is the sentence (*Moralis seu Politica Logica*, Lib. I, sect. XVI, pp. 41–45). For instance:

1. Whoever injured some person with the intention of causing death is guilty of murder and sentenced to death.
2. Peter injured John with the intention of causing death.

Therefore, Peter is to be guilty of murder and sentenced to death.

The minor premise has two parts; the first (Peter injured John) is established by the testimony of the witnesses, whereas the second, intentionality, is to be proved by another moral or legal argument:

- RA 1. Rarely anyone (almost none) boasts of a killing for which he or she was not responsible.
 PI 2. Yet Peter boasted of inflicting a serious injury on John in a particular way.
 DI – Therefore, it would be reckless to believe that he did not commit the crime.

The syllables “RA,” “PI,” and “DI” indicate the quantity of the particular statement and hence, taken together, the mood of the syllogism (all moods being of the first figure). In the latter two statements, quantity is expressed by the vowels (“I,” “I”). The quantity of the first statement is expressed by the entire syllable (“RA”) as is clear from the table below. Therefore, while the consonants in the latter two syllables probably play no

role other than helping to create a memorable word, the consonant in the first, “RA,” is meaningful.

Abbreviation	Quantifier	Mood	The mode of the conclusion
CA	Absolutely all (<i>cuncti omnes</i>)	<i>Camilli</i>	Really certain
FA	Almost all (<i>fere omnes</i>)	<i>Fallitis</i>	Morally certain
PL	Most/majority (<i>plures</i>)	<i>Placidi</i>	More probable
MA	Half (<i>media pars</i>)	<i>Magistri</i>	Equally probable
PA	A minority/not half (<i>pauciores</i>)	<i>Paridis</i>	Less probable
MU	Many (<i>multi</i>)	<i>Mugavit</i>	Scarcely probable
PU	Few (<i>pauci</i>)	<i>Pudici</i>	Reckless
RA	Almost none (<i>rari fere nulli</i>)	<i>Rapidi</i>	Reckless
NO	None (<i>nulli</i>)	<i>Nobilis</i>	Against the manifest truth

A large part of *Moralis seu Politica Logica* concerns what would now be called the philosophy of law. However, in the second book, Caramuel analyzes the so-called moral modes and the logical properties of propositions containing them: “it is certain that” (*certum esse*), “it is probable that” (*probabile esse*), and “it is doubtful that” (*dubium esse*) (*Moralis seu Politica Logica*, Lib. II, c. 2, sect. IX, p. 149).

Now let us turn our attention to Caramuel’s formal logic in the treatise *Logica Obliqua*. Scholastic logicians commonly regard syllogistics as being founded on the principle of the transitivity of identity, *quaecumque sunt eadem uni tertio, sunt eadem inter se*. Caramuel denies the absolute generality of the principle. He extends the scope of syllogistics to encompass relational syllogisms consisting of (at least some) binary relational statements containing oblique terms; for instance, in “every man loves a (some) woman,” the term “woman” is oblique (not in the

nominative case in Latin). He calls such statements, and consequently their logic, oblique or discrete (*propositio/logica obliqua seu discreta*). By “discrete” Caramuel means that the terms denote numerically distinct individuals (the men are not identical with the women in the latter statement); hence, not every valid syllogism is founded on the principle of the transitivity of identity, and the transitivity of other relations has to be taken into account. The point is that such syllogisms are not reducible to the standard ones (*syllogismi recti*) but are recognized as having an independent logical form. One can even go a step further and say that standard syllogisms are but a special type of oblique syllogism. It is not entirely clear whether Caramuel wished merely to extend or amend the standard syllogistics with his oblique logic or to replace it with a more general system. Evidence can be found for both views in his writing:

I am about to introduce a logic wholly distinct from the old logic and based on opposite foundations. In order to work and prove the validity of syllogisms, the old logic held fast to the following principle: Two things, both identical with a third thing, are themselves identical (*Que sunt eadem uni tertio, sunt eadem inter se*): Peter and an animal are identical to a man; hence, they are themselves identical. . . I do not take this proof to be sound as I find the major premise [the principle of the transitivity of identity], which is taken by the Aristotelians as a dogma, false. Setting out on a new way, I use really distinct terms from which I form propositions and new syllogisms. . . My intention is not to destroy the ancient logic which is put forth by others as well as by us with the utmost care, but to add the new logic to it and extend the number of the Muses (*Logica Obliqua*, “Lectori”, p. 406).

Before Caramuel there were other logicians who recognized some relational syllogistic forms as independent, i.e., not reducible to the standard valid moods, namely, P. Fonseca (1528–1599) (*Institutionum dialecticarum libri octo*, Lib. VI, c. 30, pp. 297–302) and F. Toletus (1532–1596) (*Introductio in dialecticam Aristotelis*, Lib. IV, c. 14, pp. 158–159) whose textbooks were cited in the Jesuit *Ratio studiorum* of 1599. In summary, Fonseca gives four rules and Toletus three. Caramuel’s set of rules includes all of the latter rules (*Logica Obliqua*, disp. VIII, pp. 430–432).

Caramuel's logic is founded on a peculiar analysis of the binary relational statement. Take the statement "every man loves a (some) woman" in the valid relational syllogism.

Every man loves a woman.
Every woman is human.
Every man loves a human.

The syllogism has more than three terms and so is not a species of valid Aristotelian form: "man," "woman," "human," "loves a (some) woman," and "loves some human." There are essentially two ways of looking at such a statement. According to one the predicate of a statement such as "loves a woman" is complex: it is itself a predication. Consequently, "loves," let us call it a relative term, is treated as a predicate term of the embedded predication ("a (some) woman is loved by"). Thus the statement contains two copulae. In the other interpretation of the statement, the relative term "loves" is not treated as a term at all, but as a generalized copula connecting the quantified subject and predicate terms "every man" and "a woman."

Caramuel devised two symbolic ways of capturing the structure of relational statements corresponding to these two interpretations. He gives symbols for the quantifiers "all," "no," and "some" ("a," "e," "i") and the negation. While there are two symbols for negation, the quantifier negation "n" and the copula negation "ñ," stemming from the first interpretation, only one symbol, "n," is needed for the second. Let us illustrate this. In the first, more complex symbol system the copula negation in "añ*i" affects the dominant copula, whereas in "a*ñi" it negates the embedded one (the symbol "*" separates the subject and the predicate parts). However, since "añ*i" is equivalent to "a*ni," one could replace the major copula negation with the negation of the second quantifier and distinguish the embedded copula negation by syntactic position rather than by a special symbol. Thus the symbol "n" occurring before a quantifier symbol is a quantifier negation, and "n" occurring after the quantifier symbol is the copula negation. Thus "añ*i" becomes "ani" and "a*ñi" can be replaced by "ain." The

embedded copula merges with the relative term to become the only generalized copula. By "generalized" we mean that any transitive verb might play the role of a copula, not just the verb "to be." This is clearly Caramuel's preferred option in his oblique logic. The generalized copula connects the subject and predicate terms (called *connotans* and *connotatus*, respectively) which are often numerically distinct, or discrete, as we have observed. Thus the second, simplified symbolism is the one Caramuel uses to list valid moods of relational syllogism. For instance, "aa.aa.aa" and "aa.a.ai" are valid moods in the first figure as symbolized by Caramuel in *Logica Obliqua* (Pars II, disp. IX, pp. 432–436). The former is of the pure relational syllogism type, all of whose statements are binary relations, the latter of the mixed type, containing a non-relational premise "a" (the mixed syllogisms are discussed in *Logica Obliqua*, Pars II, disp. XI, pp. 442–457). However, sometimes Caramuel treats "a" as "ai," so the standard "a.a.a" mood in the first figure is the valid relational "ai.ai.ai" under the same figure. Also the distinction between the mixed "aa.a.ai" and the pure "aa.ai.ai" is rather superficial. Thus Caramuel's oblique syllogistics can be seen as a more general system including the standard syllogistics in itself. At any rate, Caramuel's system is particularly innovative, both in its systematic character and the symbolism employed, when compared with the logic of his era.

Cartagena, Alonso de

Born: 1384

Died: 22 July 1456

Barry Taylor

The British Library, London, UK

Abstract

Alonso de Cartagena (c. 1384–22 July 1456) was a Castilian churchman (ultimately Bishop of Burgos) whose public life as counselor and diplomat was dedicated to the service of the crown. His works, in Latin and the vernacular, are chiefly concerned with the role of moral philosophy in matters of state. The three classical authors with whom he interacted were Aristotle, Cicero, and Seneca. Even allowing for conventional protestations of humility, his role is commonly genuinely one of transmitter and Christianizer of ancient wisdom. He was the translator of Cicero and Seneca (his Senecan translations were particularly popular in noble libraries); in the *Memoriale virtutum*, he is the compiler of texts from the *Nicomachean Ethics*. His awareness of Italian humanism and engagement with it are patent. He thus played a key role in conveying to the Castilian and Portuguese ruling elite the heritage of classical learning.

Biography

Alonso (Alfonso) de Cartagena was born c. 1384 and died on 22 July 1456. His father was the rabbi Selomo ha-Levi, who on his conversion to Christianity on 21 July 1390 took the name Pablo de Santa María. His father became successively Bishop of Cartagena and of Burgos. Both father and son wrote in Latin and Spanish.

Alfonso was therefore a Jew for the first 6 years or so of his life. It is unclear how much of his intellectual profile is due to his converso background, and he appears to show no knowledge of Hebrew.

In 1463, Juan de Lucena characterized Cartagena in an imaginary dialogue: “You wrote in the vernacular on chivalry, the republic and Christian faith, and translated the famous works of our moral Seneca” [Tú de cauallería, de re pública, de fe cristiana escreuiste vulgar, y las obras famosas del moral Séneca nuestro vulgarizaste], (Lucena 2014: 11) and this accurately encapsulates his career as an author.

After the cathedral school at Cartagena, he studied civil and canon law at Salamanca. By 1415–1416 he was Dean of Santiago de Compostela and by 1420 Dean of Segovia. From 1419 he was a courtier, serving four monarchs, John I, Henry III, John II, and Henry IV, as a diplomat and translator. His most fruitful relationship was with the cultivated and scholarly king John II of Castile (reigned 1426–1454).

From 1421 to 1431 (December 1421–December 1422; January–April 1423; December 1424–April 1425; September–December 1427), he visited the court of John I of Portugal, on a mission to negotiate peace: a particular sticking point was the ownership of the Canary Islands, which was not entirely settled by the treaty of 1431. It was not until 1437 that Cartagena wrote his *Allegaciones super conquesta Insularum Canariae contra portugalenses*.

Enforced leisure at the Portuguese court encouraged Cartagena’s first translations. The princes of the Portuguese house of Avis were notable as authors, translators, and patrons of translations. At Dom Duarte’s request he made what is thought to be his earliest translation from

Latin into Spanish, Cicero's *De inventione* (1421–1433?); only a part has survived). (The Portuguese court was as fluent in Spanish as Portuguese.) In 1422, he translated Cicero's *De senectute*, followed by the *De officiis*. The prologues are addressed to John II's secretary, Juan Alfonso de Zamora, who was on the same diplomatic mission. Zamora was also a translator of Valerius Maximus (1418–1421, from the French of Hesdin). An Old Spanish translation of Cicero's *Pro Marcello*, although unsigned, is preserved in manuscripts with other works of Cartagena and is reliably accepted as his.

In the prologue to the *De senectute*, Cartagena gives a revealing account of his working methods: "the which [this book], I dictating and you writing, caring more for the sense than for the narrow meanings of words, turning it from Latin to our language, with very little effort was completed in the spare hours, as you know" [El qual, yo diziendo y vós escribiendo, más curando del seso que de la estrecha significación de las palabras, tornándolo de latín en nuestro lenguaje, con muy pequeño trabajo se acabó en las oras que sobran del tiempo que sabedes] (Cartagena 1996: 157).

The technique of the Cicero translations is to imitate the syntax of the Latin original, to avoid Latinisms in vocabulary, and to be conservative in explanatory glosses; in general, the later Seneca translations are more given to glossing.

These Ciceronian translations, although not securely dated, form the first period of Cartagena's literary career.

His earliest Latin work is probably the *Memoriale virtutum* (1422?), dedicated to Dom Duarte: this is a mirror of princes informed by Aristotle's *Nicomachean Ethics* as commented by Thomas Aquinas. (The Spanish translation of 1474 is therefore not Cartagena's.) Cartagena casts himself in the role of compiler: "a little work encompassing sayings not of my own but of the philosophers and of certain saints under a brief epilogue" [opusculum [...] sentencias non meas set philosophicas et aliquorum sanctorum sub brevi epilogo continens] (Madrid, Biblioteca Nacional, MS 9178, f. 40r).

It is also believed that Cartagena, encouraged by Zamora, completed the translation of

Boccaccio's *De casibus* which had been begun by Pero López de Ayala (d. 1407).

In Salamanca in 1427, Cartagena entered into an epistolary debate with Leonardo Bruni (they seem never to have met) on the correct way of translating Aristotle's *Ethics* with his *Declinationes* [or *Declamationes*] *contra novam translationem Ethicorum Aristotelis*. Bruni's translation had come out in 1418. Cartagena may have owed his knowledge of this translation and others of Bruni's to Bolognese students he met at the Portuguese court; however, as Bruni is known to have corresponded with John II and sent the king his *Isagogicon moralis disciplinae*, Cartagena may well have encountered his work in Castile.

Cartagena criticizes Bruni for translating Aristotle as a work of literature rather than one of philosophy. Jerome's old division of translations into word for word and sense for sense had been joined by a newer category (present in Cicero) of a translation that aims to match the original in its rhetorical effects. To a degree Cartagena places Bruni in the Ciceronian class, while himself advocating sense for sense as more appropriate to a text to be read for its content. Bruni had of course translated directly from the Greek original but Cartagena, who confesses his ignorance of Greek, drew on his reading of the Latin Aristotle and his experience as a translator of Cicero.

Cartagena's second diplomatic mission came in 1431, when he accompanied John II to Cordoba to negotiate with the Granadans. John was the patron or at least dedicatee of a number of Spanish translators; he commissioned Cartagena to translate a good number of works by Seneca the Younger, including some works erroneously attributed to him: *De providentia*, *De clementia*, *De constantia sapientis* (the rendering of the title as *Libro de la providencia divina* is indicative of Cartagena's medievalism), Epistle LXXXVIII on the seven liberal arts, *De vita beata* and *De otio* (combined as *Libro de la vida bienaventurada*), Manelli's *Tabulatio et expositio Senecae*; not now considered as Senecan are: *Formula vitae honestae* (in fact by Martin of Braga), *Declamations* of Seneca the Elder, *De legalibus institutis*, *Tratado de la guerra* (in fact an epitome of

Vegetius), *Dichos de Seneca en el acto de la caballeria*. The attribution to Cartagena of *Dichos de Quinto Curcio* is doubtful.

The importance of Cartagena as a transmitter of the works of Seneca is obvious: these were the first Spanish translations of Seneca since the reign of Sancho IV (d. 1295) and were much copied.

Cartagena's next diplomatic mission was to the Council of Basel from 1434 to 1439. He travelled via Avignon, where he wrote for oral presentation his Latin *Expositio super legem Gallus*, a discussion of a civil law text on the confirmation or disenfranchisement of heirs.

The purpose of the Council was church reform, the settlement of the Hussite wars, and the reconciliation of the Western and Eastern churches. It was the occasion of two Latin works by Cartagena, the *Propositio super altercatione praeminentiae sedium inter oratores regum Castellae et Angliae in concilio Basileensi* and the *Allegationes super conquesta Insularum Canariae contra portugalenses*. The latter refers back to issues left unresolved in 1431, but proved successful in that it persuaded Eugenius IV to grant the Islands to Castile. The immediate question addressed by the former is the seating plan for the Council, but Cartagena marshals evidence for the general superiority of Castile over England, citing Castile's earlier Christianization and commenting on the variety of languages (Castilian, Galician, and Basque) spoken in his kingdom.

Cartagena seems to have produced only one self-translation: he put the *Propositio* into Spanish (as the *Proposicion contra los ingleses* or *Tratado de las sesiones*) at the request of the knight Juan de Silva, who was present at Basel.

The Council proved a fertile meeting-ground for men of letters. Here Cartagena met Aeneas Silvius Piccolomini, Francesco Pizolpasso, Poggio Bracciolini, Ambrogio Traversari, and Pier Candido Decembrio. When Decembrio came to translate Plato's *Politics* into Latin, Cartagena supplied advice on Aristotelian ideas. At Basel Cartagena circulated his *Declinationes contra novam translationem Ethicorum Aristotelis* of some 20 years before.

Cartagena succeeded his father as Bishop of Burgos in 1435. There followed diplomatic missions to Breslau to reconcile Albert II King of the Romans and King Casimir of Poland. In 1440, he brought Blanche of Navarre to Castile to marry Crown Prince Henry and negotiated peace treaties between the two kingdoms.

An interesting work of c. 1440 is the unsigned *Epistula ad inclitum et magnificum virum dominum Petrum Fernandi de Velasco Comitem de Haro*. The Count was a notable bibliophile who founded a home for twelve decayed knights and donated a library of 160 works for their use. Cartagena advocates that the nobleman should combine arms and letters and defines the areas of knowledge with which he should be familiar: two areas of reading which the noble should avoid are fiction (romances of chivalry such as *Amadis of Gaul* are criticized by name) and theology (the preserve of the cleric), as opposed to good Christian doctrine (for all). The Epistle forms the introduction to the *Cathoniana confectio*, a gloss in goliardic meter on the *Disticha Catonis* and *Contemptus mundi*: Cartagena's claim to have found it in his library may be a modesty topos which disguises his authorship.

Of the same period (c. 1443–47) is the *De questionibus hortolanis*, a debate with his pupil Rodrigo Sánchez de Arévalo on the superiority of sight (Arévalo) or hearing (Cartagena).

The *Duodenarium* is dated January–July 1442. Drawing on Aristotle's *Politics*, Cartagena addresses four questions put to him by his friend Fernán Pérez de Guzmán: the relationship between king and emperor; how many languages have there been; who was the most virtuous prince; who is more to be praised, the virtuous man or the virtuous woman?

His first work on chivalry (dated 17 March 1444) is the *Respuesta a la Question fecha por el magnifico señor Marques de Santillana*. Santillana had been reading Bruni's *De militia* and consulted Cartagena on a passage regarding the oath of Cato the Censor. Displaying a confidence which enabled him to criticize Bruni's Aristotle translation from a language he did not know, Cartagena admits he has not read the *De militia* but is able to answer Santillana regardless. The *De*

militia is dated 1421: the lapse of time between 1421 and 1444 reminds us that controversial literature of the time was not necessarily immediate in its responses.

Cartagena wrote more extensively on chivalry in the *Doctrinal de los caballeros* of c. 1444. It was written for a noble patron: originally Cartagena addressed it to Diego Gómez de Sandoval but later switched allegiance to Alvaro de Luna. It draws heavily on civil law sources such as the *Fuero* and particularly the *Siete Partidas* (c. 1260) of Alfonso X and on Aristotle to discuss topics both ethical and practical. Cartagena says on a number of occasions that his role has been to compile and order his material, adding little of his own (primarily the prologues and epilogue), and cites the method of Gratian. We learn that although he may not have read Bruni's *De militia*, he knew Aeschines in Bruni's translation.

Cartagena followed the *Doctrinal* with a number of purely religious works. The *Defensorium unitatis christianae* (1449) is usually seen as a response to the pogroms of that year. His *Pastoral sobre las reliquias de santa Juliana* of 16 September 1453 refers to his transfer of the relics of St Juliana to the altar of the church of Santillana and is a defense of relic worship. The *Oracional de Fernan Perez* (1454) is a work on prayer and the *Apologia sobre el psalmo "Judica me Deus"* is a work of exegesis.

His last work is the *Anacephaleosis* (1454–56), a genealogy of the kings of Castile which testifies to the late medieval interest in the gothic heritage. Earlier, in the *Propositio*, Cartagena had claimed that Castile was the heir of Rome via the Goths.

To judge from the number of extant manuscripts his most popular works were Spanish: the Seneca translations, the *Proposicion contra los ingleses* (more popular in Spanish than in Latin), and the *Doctrinal*.

At a time when it was unusual for Spanish authors to have input into the form of their books, it is interesting to note cases in which Cartagena prescribed certain formal features of his works. The *Doctrinal* is divided into Book, Chapter, Law, and Rubric (following the *mise en texte* of the juridical sources from which Cartagena quotes). Cartagena draws the reader's

attention to headings in red, "suprascriptcion de bermejo" (Cartagena 2006: 66). Like certain contemporaries, he saw it as part of the translator's task to divide the text into more readable form and add marginal cross-references (as he did with the *De inventione*). For the *Anacephaleosis*, Cartagena indicated the inclusion of miniatures of the kings and prescribed their iconography. He also took care in his will to deposit copies of his works in Burgos Cathedral library.

Many studies have been concerned with debating whether or not Cartagena is a humanist. It is more fruitful to see him as a man on the threshold of humanism, looking forwards and backwards in different works. Among his medieval features are his ignorance of Greek, his praise of (if not authorship of) the *Cathoniana confectio*, his subordination of classical wisdom to Christianity, and his stance on translation against Bruni; his humanistic features are his interaction with Italian humanists, a knowledge of Greek literature in Latin translation, his use of the phrase "studia humanitatis," and his promotion of the ideal knight who combines arms and letters. His legacy was as a popularizer of Cicero and Seneca in his translations and of Aristotle in his moral and political work, teaching philosophy for the court, and nobility.

Cartography in the Renaissance

Angelo Cattaneo

CHAM – Center for the Humanities, Faculty of Social Sciences and Humanities, Universidade Nova de Lisboa (NOVA FCSH), Lisbon, Portugal

Abstract

This essay draws a cultural history of cartography and cosmography focusing on some of the transformative processes and changing functions that characterized these fields of knowledge, using European sources, over a period of nearly four centuries, from 1250

until 1650. This long-term analysis of cosmographic and cartographic corpora is essential to highlight both continuity and structural changes in Medieval and Renaissance knowledge systems as well to develop a theoretical understanding of knowledge transformation and evolution, taking into account epistemic, social, and material dimensions.

Until the twelfth century, the Medieval Christian cosmography was based on two main assumptions: (1) the number of peoples of the world had been established definitively following the flood; and (2) the inhabited world had been comprehensively described, once and for all, by the Greek and Roman geographers. Since circa 1250, these two assumptions were challenged and subverted by long-term and interdependent processes, which embrace diverse horizons of the history of culture, economics, science, and technology.

Literary discoveries of long forgotten cosmographic classical works were translated into Latin at first from Arabic and later from Greek. The appearance and diffusion of marine charts, portolans, and other measurement instruments in several (port) cities in the Mediterranean Sea basin and the Atlantic European coasts, the technological evolution of ships and sails, the collapse of long-distance terrestrial trade networks in central Asia after the fall of the Mongol Empire, the Iberian quest for new maritime routes, and the mental opening toward seas previously considered inaccessible to humans, all together had structural, transformative impacts on the way the world has been experienced, conceived, and represented, also through cosmography and cartography, by several communities of interpretations, from learned scholars and men of letters to members of religious orders and missionaries, urban classes, including, merchants, navigators, soldiers, and diplomats.

Heritage and Rupture with the Tradition

Between circa 1250, when a few Franciscan missionaries and Christian merchants reached the

capitals of the Mongol Empire – first, Karakorum, in Mongolia, and subsequently Khān Bālīq (in Uyghur, The City of the Khān), nowadays Beijing (Khān Bālīq, also known in Mongolian and Chinese sources as Dadu (in Chinese 大都, “The Grand Capital”), was transformed into the capital of the Mongol Empire by Kublai Khān in 1272. See Haw 2006, pp. 44–52.) – and the end of the sixteenth century, when Abraham Ortelius (1528–1598) published in Antwerp the *Theatrum orbis terrarum* (1570) and the *Theatri orbis terrarum parergon sive veteris geographiae tabulae* (1579–1606), the shape, dimensions, and perception of the inhabited and known part of the earth (*oikumene*) underwent a slow but profound change. (The title means: “Beside the *Theatrum orbis terrarum*, or some maps of ancient geography.” Freely translated, it means “Additional maps of historical geography added to the *Theatrum orbis terrarum*.” The title is based on the Greek noun and concept of *párerigon*, nominal use of the neuter of *párergos*: “beside the main subject.” On the *Theatri orbis terrarum parergon*, see Besse (2009).) This transformation developed in a critical juncture in world history when an unprecedented number of people – Europeans, Africans, Asians, and, to a lesser extent and from c. 1500 onwards, also Amerindians – made or were forced to make transoceanic or long-distance journeys and all the major urban civilizations of the world became globally interconnected for the first time. (Among several recent publications, for the period before 1500, see: Brentjes and Renn (2016); for the period post 1400, see: Bentley et al. (2018)). Both Ortelius’ *Theatrum orbis terrarum* and the *Theatri orbis terrarum parergon* – the first atlas of historical geography and cartography printed in Europe – provide a most effective cartographic conceptualization and representation of the remodeling of the ancient world in the period 1250–1650.

Among the historical maps of the biblical and classical world of the *Theatri... parergon*, one in particular, entitled *Aevi veteris, typus geographicus* (literally, Map of the Ancient Time, that is, a map of the classical world) is paramount to understand the early modern intelligence of the space of (Mediterranean) Antiquity

and its successive transformations. The *Aevi veteris, typus geographicus* displays a Ptolemaic representation of the Roman *oikoumene*, at the time of the widest expansion of the Roman Empire, during the Nerva–Antonine dynasty (96–192 AD). The map is inserted into a graduated cartographic grid that encompasses the entire surface of the terrestrial globe in oval projection, purposely left blank (Fig. 1). Through this image, Ortelius aimed at highlighting the main foundational principles of classical cosmography and world cartography, epitomized by the works of Ptolemy. According to the Alexandrian scientist, the earth was occupied for 6/7 by land and all the seas were Mediterranean, including the Indian Ocean. Furthermore, only 1/4 of the entire surface of the earth was considered habitable and knowable by human beings. This portion measured 180° in longitude (from the Canaries, called *Insulae fortunatae*, in the West, to *Cattigara* and the *Magnus Sinus* – the Gulf of Siam – in the East) and c. 90° in latitude (from *Thule* in the North – placed at circa 63° N., to *Syene*, nowadays Assuan, in Egypt, to the South, at 16° lat. S.). Beyond these longitudes and latitudes there was *terra incognita* that could not be inhabited due to excessive heat (at the equator) or excessive cold (at the poles). Within the *oikumene* Ptolemy placed instead c. 8.000 places (towns, rivers, mountains, gulfs, seas, and islands), each of them accompanied and identified by pairs of latitudes and longitudes (Dilke 1987)

The readers of the *Parergon* who were familiar with the famous planisphere of the *Theatrum orbis terrarum* – one of the most widespread and known sixteenth-century cartographic representations of the whole world, reproduced and plagiarized in dozens of multilingual editions until the mid-seventeenth century – could thus easily observe and appreciate the enormous extent of the lands and seas discovered by the moderns (Fig. 2) (Koeman et al. 1672) The world of the moderns exemplified by Ortelius’ *Typus orbis terrarum* (map of the world) encompassed the whole globe and was therefore nearly four times bigger than that of the ancients. As is well-known, beside the three parts known to the ancients, a fourth part, named *America* by the Humanist cartographer Martin

Cartography in the Renaissance, Fig. 1 Abraham Ortelius, *Aevi veteris, typus geographicus* (literally, Map of the Ancient Time, that is, a map of the classical world) in

Theatri orbis terrarum parergon, sive veteris geographiae tabulae. Antwerp: [s.n.] 1590, pl. 25

Waldseemüller in 1507 – a tribute to the cosmographer and navigator Amerigo Vespucci – was added to the circumnavigable Africa, the much-extended Asia, the Pacific Ocean, and, in the South, a huge *Terra australis incognita* (Among others see Johnson (2006)).

On the basis of interpretations that emerged during the eighteenth and nineteenth centuries, positivist historiography has long insisted on a “revolutionary” interpretation of these articulated symbiotic processes of expansion and representation of the earth, understood as radical shifts from alleged “symbolic” and “theological” Medieval geography and cartography (which supposedly were not interested in representing the “real” world, but only the universal history of creation and salvation) and the accurate, mathematical, and experience-based knowledge of Renaissance cartography, focused on the “real” world.

More recent contributions have instead highlighted the *longue durée* and the structural dimension of continuity between the Middle Ages and the early modern age, not only with respect to the process of the European maritime expansion, but also in the epistemological status of its literary and cartographic representations, in particular cosmography and world cartography (Woodward 2007; Dalché 2015a). At this regard, epistemological ruptures such as “from the flat Earth to the round Earth” – often mentioned at ongoing celebrations of the “discoveries,” e.g., of America, Brazil, and the Strait of Magellan, by various “first European expeditions” – that allegedly took place between the late Medieval and early modern eras, remain undocumented. Indeed, they may be characterized as banal and misleading oversimplifications about the European expansion, as well as its cartographic delineations

Cartography in the Renaissance, Fig. 2 Abraham Ortelius (engraver: Frans Hogenberg), *Typus orbis terrarum* (map of the whole world) in *Theatrum orbis terrarum*, Antwerp: Apud Aegid. Coppenium Diesth, 1570

and scientific implications (Inadequate as held in Randles (1994)).

Innovative and Original Aspects

Until the twelfth century, the Medieval Christian cosmography, transmitted by monastic schools (*scholae*) and universities (*studia*), was based on two main assumptions: (1) the number of peoples of the world had been established, once and for all, from the moment in which the sons of Noah and their descendants spread over the *oikoumene* following the flood; and (2) the inhabited world had been comprehensively described by Greek and Roman geographers and poets (above all Virgil, Pliny, and Soline). The Roman pagan *imago mundi* was then reinterpreted in the light of the Christian revelation by Paulus Orosius (c. 375–c. 420), disciple of Saint Augustine, in the first Christian universal history as the *Historiarum*

adversus paganos septem libri (fifth century). These two principles implied an important consequence in terms of method: to cope with the need to update the description of both the *oikoumene* and the peoples of the world it was sufficient to trace the changes in the history of the denomination of the regions and peoples (Gautier Dalché 2008).

These two assumptions were challenged and subverted by four main historical, long-term, interdependent processes, which embrace diverse horizons of the history of culture, economics, science, and technology. All together, they had a structural impact on the way a rapidly changing and expanding world has been experienced, conceived, and represented, also through cartography, by several communities of interpretations, from learned scholars and men of letters to members of religious orders and missionaries and urban merchant classes, including navigators and diplomats.

Starting from the second half of the twelfth century, literary discoveries enriched the range

of available geographical knowledge. Long-forgotten cosmographic classical works, originally in Greek, were translated into Latin from Arabic (in particular the Aristotelian corpus, later defined as *Aristoteles latinus*, including the *De caelo* and the *Methereologica* that discussed the relative position and size of the earth within the sublunary world, in relation to the other Aristotelian elements of water, air, and fire, placed beneath the circle of the moon) (*Aristoteles Latinus Database* 2018). One hundred years later, ancient treatises of Roman geography, such as the *De chorographia* of the Roman geographer Pomponius Mela (first century c.e), were rediscovered, while at the same time several written recounts in Latin as well as in various vernaculars of the pilgrimages, such as *ad Terram Sanctam*, and the reports of both missionary and merchant journeys to the Near East, Central Asia, and even Mongolia and China led to the first significant redefinition of the *imago mundi* inherited from Antiquity. Among these treatises were particularly relevant, because widespread in tens and even hundreds of manuscript copies, those of the Franciscans John of Pianocarpine (c. 1182–1252), William of Rubruck (c. 1220–1293), John of Montecorvino (1247–1328), and Odoric of Pordenone (c. 1265–1331), among others, about the Mongols and the Mongol Empire, together with merchants-travelers' and diplomats' recounts, such as those of Marco Polo (1254–1324) about the Mongol Empire at the time Kublai – co-written in Genoa with the Arthurian romance writer Rustichello da Pisa (second half of the thirteenth century) – Ruy González de Clavijo (d. 1412) on the Court of Tamerlan, and Niccolò de' Conti (1395–1469), on several places and people of South East Asia, the latter recounted by the humanist Poggio Bracciolini as the *Liber IV* of the *De varietate fortunae* (The Vicissitudes of Fortune) (*Sinica Franciscana* 1929; Tucci 1981; Dalché 2013; Gadrat-Ouerfelli 2015; Gonzalez de Clavijo and Markham 2010; *De l'Inde* 2004).

From the mid-fourteenth century, a later stage of this process had its roots in the Italian Humanism (involving several communities of scholars and readers, in particular in Florence, Pavia,

Milan, Venice, and the Roman Curia, which were linked to other communities of scholars, all over Europe) and the interest on the part of its most important protagonists in the geography, medicine, and astronomy of the ancients (See Garin 1989). It was in the framework of the Humanistic rediscovery and translation into Latin of long-forgotten Greek texts that the *Geographike uphégesis* (Guide Cartography) by the Alexandrian scientist Ptolemy (II cent. AD) and Strabo's *Geography* (I cent. BC) were translated into Latin, between 1406–09 and 1453–1458, respectively (Diller and Kristeller 1960).

In the context of this essay, it is worth recalling the history of the Humanistic reception in Latin of Ptolemy's *Geography*, a milestone not only in Renaissance cartography but also for the modern foundation, affirmation, and dissemination of mathematical cartography (*cosmographia more mathematicorum*, in the words of Iacopo Angeli's introduction to the Latin translation of the work). (Iacopo Angeli's introduction to the *Cosmographia*, his Latin translation of the *Geographiké uphégesis*, is published in Hankins 1992.) While Ptolemy's *Almagest* had been translated from Greek into Syriac and Arabic between the seventh and ninth century and from Arabic into Latin in 1172, by Gerard of Cremona (1114–1187), Ptolemy's *Geographike uphégesis* remained unavailable in the West until the end of the fourteenth century, though the Arabs had known it since at least the ninth century. In 1397, when Manuel Chrysoloras (c. 1350–1415), a byzantine humanist from Constantinople and diplomat for Emperor Manuel II Palaeologus (1350–1415), was officially called to Florence by Coluccio Salutati to teach Greek, he brought with him a set of Greek manuscripts, among which was a codex of the *Geographiké uphégesis* (probably, the current codex Vatican Library, Urbinas graecus 82) illustrated with twenty-seven maps (Gentile 1991; Claudius Ptolemaeus 1932): twelve for Europe, four for Africa, and ten for Asia, plus a map of the entire inhabited world (*oikoumene*) (Fig. 3). In 1409, one of his pupils, Iacopo Angeli from Scarperia (c. 1360–c. 1410), at that time apostolic secretary at the Holy See

Cartography in the Renaissance, Fig. 3 Map of the *oikumene* (the known and inhabitable part of the world), in Claudius Ptolemaeus, *Geographiké uphégesis* (Guide to

Cartography), manuscript on vellum, Byzantium, 13th century. Vatican City, Vatican Library, Urbinas graecus 82, ff. 60v-61r. https://digi.vatlib.it/view/MSS_Urb.gr.82

under the pope Alexander V, translated it into Latin with the title of *Cosmographia*, to emphasize the links between the earth and the cosmos, that is, the celestial world (Farzone 2004). Iacopo Angeli understood that the scientific value of the *Geographiké uphégesis* lay in the fact that Ptolemy had solved the problem of representing the known and inhabitable part of the world and, in theory, the earth as a whole, on the flat surface of maps by using codified geometric procedures that allowed for a clear identification of places through their permanent astronomical coordinates. In Book I, chapters 23 and 24, and Book VII, chapter 6 – the so-called theoretical chapters of the *Geography*, probably already translated into Latin by Manuel Chrysoloras himself – Ptolemy demonstrated how to construct ecumenical maps in accordance with three geometric procedures. This way the methodology and practice of creating cartographic projections, originally developed in Alexandria in the second century of the Christian era, were revived in Florence, and spread all

over Europe, in the fifteenth century (Jones and Berggren 2000; Gentile 2001; Dalché 2007).

From the end of the thirteenth century, a second process concerns the appearance and diffusion of marine charts and portolans in several port cities in the northern side of the Mediterranean Sea basin, with two main *foci*, the Italian peninsula and the Catalan islands and coasts. Marine charts are manuscript cartographic representations, generally on vellum, that detail the coastlines of the Black Sea, the Mediterranean Sea basin, the Atlantic coast of North Africa, the Iberian peninsula, France, England, and the Flanders, on the basis of the main winds that are graphically designed and connected through wind roses. The oldest undated chart might be the so-called *Carte pisane*, presumably of c. 1290 (Fig. 4) (Paris, BnF, Cartes et Plans, Rés. Ge B 111. Pujades i Bataller (2013), for a comprehensive view: Pujades i Bataller (2007)). Among the oldest dated charts, those by the Genoese cartographer Pietro Vesconte (fl. c. 1310–30) stand out. Active in

Cartography in the Renaissance, Fig. 4 Marine chart of the Mediterranean Sea basin, the Black Sea, and the European Atlantic coasts, known as “Carte Pisane,” manuscript on vellum, end of the 13th century. Paris,

Bibliothèque nationale de France, département Cartes et plans, GE B-1118 (RES). <https://gallica.bnf.fr/ark:/12148/btv1b52503226n.r=carte%20pisane?rk=21459;2>

Genoa and by 1318 in Venice, Vesconte signed and dated charts since 1311 (Fig. 5) (Florence, Archivio di Stato, Carta nautica 1, Pietro Vesconte, ink and colours on vellum, 1311. – <http://www.archiviodistato.firenze.it/archividigitali/riproduzione/?id=148176>).

The portolans (from the Italian *portolano* – that is, a list of ports – also known as *compasso* or *compassus de navigare*) consist instead of lists of port cities, promontories, sea rocks, shallows, gulfs, and river mouths, with their respective distances of navigation as well as angular distances, calculated on the basis of the main winds, half winds, and quarters of wind, written on paper codices.

The origins as well as the use of the marine charts and portolans can no longer be researched solely through and within the experiences of navigation and sea trade, but more so through the learned and scholarly framing of such practices within the context of urban cultures within which practical and erudite items of knowledge flowed together in a symbiotic manner as eloquently shown by the *Liber de existencia rivierarum et forma maris nostri Meditteranei* (late twelfth century). The *Liber* was written in Pisa, most likely

by one of the many clergymen, who acted as notaries and chaplains on the naval convoys and as urban notaries between the end of the twelfth century and the first decades of the thirteenth century. (London, British Library, Cotton Domitianus A XIII, ff. 114r-129v, c. 1200. Dalché 1995.) This work contains about 1200 place names that detail the coastal toponymy of the whole of the Mediterranean Sea basin, including a range of open-sea crossings – features which would be directly relevant to a sailor. However, Tony Campbell argues, that was certainly not the work’s sole purpose: information for a well-educated Christian pilgrim is also plentiful, hence the prominence given to the Holy Land (Campbell 2018). Also, the wealth of maritime information aggregated in the *Compasso de navigare*, the oldest extant manuscript *portolano* in the vernacular, completed in 1296 (the current codex Berlin, Staatsbibliothek, Hamilton 396), circulated well beyond the marine milieu in which it was originally produced (Motzo 1947. New edition: Debanne, Alessandra *Lo Compasso de navegare. Edizione del codice Hamilton 396 con commento linguistico e glossario*. Brussels, Wien: Peter Lang, 2011. See also Bouloux

Cartography in the Renaissance, Fig. 5 Pietro Vesconte, Marine chart of the Mediterranean Sea basin, the Black Sea, and the European Atlantic coasts.

Manuscript on vellum, Venice, 1311. Florence, Archivio di Stato, Carta nautica 1. <http://www.archiviodistato.firenze.it/archividigitali/riproduzione/?id=148176>

2002, pp. 45–68, 88–97). Marin Sanudo the Elder (c. 1270–c. 1324) used and translated into Latin a conspicuous part of the *Compasso* for the cartographic descriptions and maps of the *Liber secretorum fidelium Crucis super Terrae sanctae recuperatione et conservatione*..., an appeal to the crusade presented to pope John XXII in Avignon in September 1321 (this is the current codex Vatican Library, Vat. lat. 2972) displaying six maps designed by Pietro Vesconte. (On Sanudo the Elder: Bongars, Jacques (ed.) *Liber secretorum fidelium Crucis super Terrae sanctae recuperatione et conservatione. quo et Terrae sanctae historia ab origine et eiusdem vicinarumque provinciarum geographica descriptio continetur. Cuius auctor Marinus Sanutus dictus Torsellus patricius Venetus. Nunc*

primùm, cum libello eiusdem argumenti, sine auctoris nomine, ex mss. veteribus editus. Orientalis historiae tomus secundus. Hanoviae (Hanau), Typis Wecheliani, apud heredes Ioannis Aubrii, 1611 (re-edited by Joshua Prawer, Toronto, Buffalo: University of Toronto Press, 1972). English translation and commentary: Marinus Sanutus dictus Torsellus 2011. There are 19 manuscript complete copies of the *Liber secretorum*; nine of which have maps. See Peter Lock's introduction, pp. 13–16.)

The examination of extant marine charts preserved in the archives, libraries, and private collections reveals that they were not destined to be used wholly for navigation; in fact, not only they do not bear any trace of having been used at sea, but not even of having been associated with

determining the route of the journey or the calculation of distances, on which there do not appear indeed the points of the compass. Despite the testimony of rare archival documents indicating the presence of marine charts accompanied by a written portolancon board ships, their presence on board appears to have been far from a general custom (Campbell 2011. See also the classical essay Campbell 1987. Also see de la Roncière (1897)). The studies on the practice of both Medieval and early modern Venetian navigation up to the end of the sixteenth century through outstanding works such as Michael of Rhodes' maritime manuscript and Benedetto Cotrugli's treatise *De navigatione* (On Navigation), both written in the Venetian vernacular in 1430–1460 and 1464–1465, respectively, have shown that the use of nautical chart was mostly made recourse to in order to determine distances and calculate the routes. Still, it was empirical knowledge and the ability to “read the sea” of the sea captains guiding navigation, for both military and the commercial kind of navigation in the Mediterranean and along the Atlantic coast. (Long et al. 2009 (the entire Book 3. Tucci 1958. Falchetta 2009 (in particular “Della Cartha de Navegare. C. I,” pp. 57–58 and pp. 182–183). Available on-line at <http://independent.academia.edu/PieroFalchetta>. Dalché (2015b).)

The function of nautical cartography, from the time of the crusades until the oceanic expeditions (as it were at least to begin from the voyage of the Genoese Vivaldi brothers around 1290 and from the conquest of the Canaries around 1341), was also that of an effective holistic intellectual organization of space (Padoan 2012). Therefore, besides being practical instruments for calculating distances at sea, they were also perceived as complex cultural syntheses for the use of the urban merchant classes, men of letters, and princes for their understanding of the Mediterranean Sea basin, the Black Sea, and the African and European Atlantic coasts. In short, for all those who had a particular interest in space in the hope of organizing and planning navigation and commercial activity, warfare, and conquest, as well as for facilitating pilgrimage to holy sites, but also imaginary journeys, as in the case of Francesco

Petrarca's *Itinerarium ad sepulcrum Domini nostri Ihesu Cristi ad Iohannem de Mandello* (1358), in which the humanist poet also relied on a marine chart to compose a fictional pilgrimage guide to the Holy Land (Cachey 2002; Dorninger 2006–07. There are also a French and an Italian editions).

From the second half of the thirteenth century, nautical cartography of Mediterranean provenance and, from the beginning of the fifteenth century, Ptolemaic cartography, broadened in the light of either textual discoveries or of the knowledge emerging from voyages beyond the ecumencial space known to the ancients, provided the spatial graphic structure on which an expanded *imago mundi* was depicted by cartographers. Fra Mauro's mid-fifteenth-century map of the world and Henricus Martellus Germanus's *Insularium illustratum* show in clear visual form the interaction between the abovementioned processes, representing a summa of both geographic and textual discoveries that became available at that time. The first is the extremely renowned work of the Venetian Camaldolese Fra Mauro (died c. 1459/64), designed around 1450, in the monastery of St. Michael of Murano in the Venetian lagoon, which is now kept in the Marciana Library of Venice (Fig. 6). (Fra Mauro's *mappa mundi*, manuscript on vellum, written in Venetian vernacular, San Michele di Murano (Venice), c. 1450. Venice, Biblioteca Nazionale Marciana, inventory number 106173. Gasparrini Leporace 1956; Falchetta 2006; Cattaneo 2011.) In 1457, the Portuguese court of Afonso V commissioned a copy of this *mappa mundi*, which was sent to Lisbon in April 1459 but is now lost. Fra Mauro's map outlines the *imago mundi* at the onset of the Portuguese and Spanish sea voyages and explains their cosmographic scenario. The shape of Africa, even if mostly conjectural, in particular in its southern tip, clearly aims at illustrating that its circumnavigation was possible. This work was among the first attempts to update the world view of Ptolemy's *Geography* through the massive use of the travelers' accounts of Marco Polo, the Franciscan missionaries, and Nicolò di Conti (that is, the *Liber IV* of the *De varietate fortunae*

Cartography in the Renaissance, Fig. 6 Fra Mauro Camaldolese, [*Mappa mundi*]. Manuscript on several pieces of vellum glued on wooden panels. Venice, San

Michele di Murano, c. 1450. Venice, Biblioteca Nazionale Marciana, inventory number 106173

written by Poggio Bracciolini) for Asia, the Indian Ocean, and its islands, that are placed in a Ptolemaic coastal profile nonetheless designated in the graphic form of marine cartography.

Henricus Martellus Germanus' graduated planisphere in the *Insularium illustratum*, designed around c. 1490, radically modifies the world maps in of Ptolemy's *Geography*, updating them according to the Portuguese discoveries along the western coast of Africa (Fig. 7). (Five copies of the *Insularium illustratum* survive: Florence, Biblioteca Medicea Laurenziana, Plut. XXIX 25, considered to be Martellus's working copy and the basis for the other codices; London, British Library, MS. Add. 15,760; Leiden, Bibliothek der Rijksuniversiteit, Ms. Vossianus lat. Fol. 23;

Chantilly, Musée Condé, Ms. 698-0483; Minneapolis, University of Minnesota, James Ford Bell Library, Bell 1475fMa without the planisphere.) The fundamental characteristic of this planisphere in comparison to the ancient Ptolemaic world map is its widening up to 220° of longitude, the enlargement of over 40° to the east depending most of all on Marco Polo. In addition, it represents the African coast as far south as the Cape of Good Hope, demonstrating Africa's circumnavigability and the opening of the Indian Ocean into the Atlantic Ocean. Around 1490, Martellus included, almost simultaneously, information derived from the navigation of Diogo Cão along the African coast to the Congo River (1482–1483 and 1485–1486) and of Bartolomeu Dias

Cartography in the Renaissance, Fig. 7 Henricus Martellus Germanus, Ptolemaic planisphere expanded to include Portuguese navigations of 1485–1489, circumnavigating Africa. Manuscript on vellum, written in Latin and

Florentine vernacular, in *Insularium illustratum* (Illustrated book of islands), Florence, c. 1492. Florence, Biblioteca Medicea Laurenziana, Pluteo 29 25, ff. 66v–67r

(1487–1488) up to *Cabo das Tormentas*, called *Cabo da Boa Esperança* after Dias’s return to Lisbon and recorded on this planisphere as “cavo de esperanza” (Cape of Hope), almost overflowing from the graphic space of the map.

The design of Mauro’s and Martellus’s map becomes explicable by taking into consideration three distinct but overlapping historical processes. These were the foundation of a world capitalist economy within a context that Fernand Braudel, Vitorino Magalhães Godinho, and Emmanuel Wallerstein have defined as a “world economy”; the development of long-distance networks of knowledge; and, finally, the expansion and mental opening toward lands and seas previously considered inaccessible to humans (Cattaneo 2011, 185–225. See also Fernández-Armesto 1987; Cattaneo 2016a).

Even fifteenth- and sixteenth-century cosmographers and cartographers working for the Portuguese and Spanish Crowns – the only ones to have direct access to the maps designed by sea captains during their voyages, and to their

official written reports (*roteiros*) – also availed themselves of “bookish knowledge” for the design of their world maps. Such cartographers, notably Amerigo and Giovanni Vespucci, Pedro and Jorge Reinel, Lopo and Diogo Homen, and Diogo Ribeiro, for those parts of the globe regarding which they lacked direct knowledge, had recourse to ancient maps, although they were aware that those maps were fully conjectural. At this regard, one of earliest and most spectacular testimonies for the Portuguese expansion, the so-called *Cantino Planisphere* – secretly obtained in Lisbon by Alberto Cantino, agent of Ercole I d’Este (1431–1505), Duke of Ferrara, in October 1502 – reproduces the conjectural “bookish” coastal shapes of Ptolemy’s *Chersonesus Aurea peninsula* and *Magnus Sinus* for Eastern Asia, which Portuguese expeditions had not yet reached around 1500. The “bookish knowledge” of Ptolemy is placed beside the very accurate representations of the African coastal profile, the first ever representation of the coasts of Brazil and of India, all based upon

Cartography in the Renaissance, Fig. 8 Marine planisphere expanded to include Portuguese navigations until 1502, circumnavigating Africa and as far India, known as

Cantino planisphere. Manuscript on vellum, written in Portuguese. Lisbon, 1502. Modena (Italy), Biblioteca Estense e Universitaria, C.G.A.2

sistematic astronomical observations that enabled the precise determination of latitudes (Fig. 8). (Modena, Biblioteca Estense e Universitaria, C.G.A.2, [*Carta del Cantino*], ink and colors on three sheets of parchment, 1502. Cortesão and Teixeira da Mota 1960; Milano 1991; Alegria et al. 2007. On early modern nautical charts: Gaspar 2017.)

Impact and Legacy

From the end of the fifteenth century, nautical cartography and Ptolemaic cartography were integrated by cartographers and cosmographers working for the Iberian Crowns with systematic surveys of coastal latitudes, first starting from the Atlantic coasts, then on a global level. It is important to stress the role of low educated people, such as sea captains, sailors, and soldiers, in measurement practices that brought to a mathematical reconfiguration of the world image, beyond those inherited from Antiquity and the Middle Ages (Teixeira da Mota 1961; Leitão 2013). These measurements, the first to be conducted through astrolabes and other scientific instruments at a global scale, were systematized and aggregated in the framework of the

cosmographic activities of the *Casa da Índia* and *Casa da Mina e da Guiné* (the House of India and House of Mina and Guiné) in Lisbon and the *Casa de la Contratación* (the House of Trade) in Seville and, starting from the second half of the sixteenth century, also in the main colonial urban centers, like Goa, Macao, Malacca, Nagasaki, Mexico City, and Lima (Cortesão and Teixeira da Mota 1960–1962, in particular vol. 3 and vol. 4. Mundi 1996; Portuondo 2009). These innovative institutions were founded by the Iberian Crowns to centralize the following functions: prepare maritime travel, recruit sea pilots and take care of their cosmographic education, issue navigation licenses, prepare the official charts for navigation and their synoptic aggregations known as *padrão real* (in Portuguese) or *padrón real* or *padrón general* (in Spanish) – that is, “master chart” – but also secure the payment of taxes in favor of the Crown, particularly of goods from oversea territories. From the beginning of the seventeenth century Amsterdam and Batavia (nowadays Jakarta) also became major hubs for the global cartographic production, by aggregating geographic information through the Dutch East India Company (*Vereenigde Oostindische Compagnie*, VOC, founded in 1602) and the Dutch West India Company (*Geocroyeerde*

Westindische Compagnie, GWIC, founded in 1621) (Zandvliet 2007).

To conclude, the cartographic and cosmographic works of the humanist cartographer Martin Waldseemüller (1470–1521) and the Latinist, Hellenist scholar and poet Mathias Ringmann (1482–1511) provide a very clear example of the cultural synthesis operated through Renaissance cartography. Waldseemüller and Ringmann were active in the *Gymnasium Vosagense*, a literary and scientific association located at Saint-Dié des Vosges, under the patronage of Duke René II, and were in contact with Venetian, Paduan, and Florentine humanist circles. Their major works are the *Cosmographiae introductio* accompanied by a universal planisphere, both printed in 1507. The introduction to cosmography was conceived in such a way as to prepare the reader for a more complex work: a new edition of Ptolemy's *Geography*, eventually published by Ringmann and Waldseemüller in Strasbourg in 1513 to correct and update previous editions of the work that strictly relied upon Iacopo Angeli's problematic Latin translation of 1409 (for an in-depth study on the cosmographic activities of the *Gymnasium*, see Baldi 2018).

It is worth mentioning the entire title of the *Introductio: Cosmographiae introductio cum quibusdam geometriae ac astronomiae principiis ad eam rem necessariis. Insuper quatuor Americi Vesputii navigationes. Universalis Cosmographiae descriptio tam in solido quam plano, eis etiam insertis quae Ptholomaeo ignota a nuperis reperta sunt* (Saint-Dié, [25 April] 1507). (The Library of Congress has made available a free digital edition: http://lcweb2.loc.gov/cgi-bin/ampage?collId=rbc3&fileName=rbc0001_2008thacher16176page.db&recNum=8.) This is the English translation of the title: "Introduction to cosmography with certain necessary principles of geometry and astronomy to which are added the four voyages of Amerigo Vespucci: A representation of the entire world, both in the solid and projected on the plane, Including also lands which were unknown to Ptolemy, and have been recently discovered." The introduction to the first edition of the *Cosmographiae introductio* details the entire cultural and editorial project –

an introduction to plane and spherical geometry, elementary notions of astronomy, a world map, a globe, and a new edition of Ptolemy's *Geography*:

[...] the idea was born among us, who have recently opened a printing press in the Vosges Mountains of Lorraine in the little town called St Dié, and who have studied the books of Ptolemy from a Greek codex, to add the reports of the four voyages of Amerigo Vespucci. I have prepared a map of the whole world, for the general use of scholars—in the manner of an introduction to cosmography—both as a three-dimensional globe and as a two-dimensional map. ("Hinc effectum et ut nobis (qui librariam officinam apud Lotharinge Vosagum in oppido cui vocabulum est Sancto Deodato nuper ereximus) Ptholomei libros post exemplar Grecum recognoscentibus, necnon quatuor Americi Vesputij navigationum lustrationes adijecientibus totius orbis typum tam in solido quam plano (velut previam quandam ysagogen) pro communi studiosorum utilitate paraverimus", *Cosmographiae Introductio*, p. Aii (first edition, 25 April 1507).)

Beside Ptolemy, also the name of the cosmographer and navigator Amerigo Vespucci is given emphasis. Waldseemüller and the *Gymnasium* openly gave credit to their contemporary Vespucci for having recognized and described lands beyond the space known to the ancients as a new *quarta pars orbis* unknown to the ancients, as opposed to Columbus, who, notwithstanding his status as discoverer, had a delayed understanding of his own accomplishment. As is known, not only did Waldseemüller name the *quarta pars orbis* "America," but he also proclaimed Vespucci to be the "New Ptolemy." Both Ptolemy's and Vespucci's names are also used in the title of the planisphere mentioned in the *Cosmographiae introductio*, which was engraved on twelve wooden boards and printed at Saint Dié in 1507: the *Universalis cosmographia secundum Ptholomaei traditionem et Americi Vesputii alioru(m)que lustrationes* (the Universal Cosmography according to the Tradition of Ptolemy and the Discoveries of Amerigo Vespucci and others) (Fig. 9) (Waldseemüller (1470 circa 1519). Digital interactive edition: *A land beyond the stars* – <http://exhibits.museogalileo.it/waldseemuller/index.html>.) Two hemispheres are illustrated in the upper part of the world map. The ancient hemisphere (from the prime meridian crossing the *Fortunate Isles* to *Cattigara* 180° E. long.) is placed next to Ptolemy; whereas,

Cartography in the Renaissance, Fig. 9 Martin Waldseemüller, Matthias Ringmann, [The ancient world and the modern world], detail of the *Universalis cosmographia secundum Ptholomaei traditionem et*

Americi Vespucii aliorum[m]que lustrationes, 1507. Woodcuts on twelve sheets of paper, written in Latin, Saint-Dié des Vosges, 1507. Washington, DC, Library of Congress, Geography and Map Division, G3200 1507. W3

the second hemisphere is placed next to Vespucci and includes the *quarta pars orbis* and Asia beyond *Cattigara*, that is to say *Cathay* and *Mangi*, a path that was mostly traveled by Franciscan missionaries and merchants such as Marco Polo, his father and uncle from the mid-thirteenth century onwards. Thus, Vespucci is depicted as the “new Ptolemy”: a landmark and at the same time a symbol representing a new way to conceive the world, which was far more vast than *America* alone, and with a much more extensive temporality. On a cartouche at the bottom-right corner of his planisphere Waldseemüller writes:

Although most of the ancients were particularly diligent in describing the regions of the world, many lands remained unknown to them, such as, for example, to the west, America, named after its discoverer, which should be regarded as the fourth part of the world. Likewise, to the south, the part of Africa that begins almost 7 degrees on this side of the Tropic of Capricorn, and stretches far to the south beyond the torrid zone and that same tropic. And also, to the east, the region of Cathay and the part of southern India lying beyond 180 degrees longitude. We have added these places to those known previously, so that the students of subjects of this kind, looking with their own eyes at all that is known in our day, will recognize our accuracy [...]. (“Licet plerique veterum describendi terrarum orbis studiosissimi fuerint, non tamen parum ipsis eisdem incognita manserunt, sicut est in casu Americae, ab eius nominis inventore dicta; quae orbis quarta pars putanda est. Sicut et versus meridiem Aphrice pars, quae septem pene gradibus citra Capricornum incipiens ultra torridam zonam et Egoceri tropicum ad austrum latissime protenditur. Sicut quoque in tractu orientali regio CATAIAE et quicquid INDIAE meridionalis

ultra centesimum et octogesimum longitudinis gradum est situm. Quae nos prioribus omnia adiunximus ut istiusmodi rerum amatores quaecunque sub hanc diem nobis patent oculis intuentes, diligentiam nostram p[ro]bent”, *Universalis cosmographia*, cartouche placed in the bottom right corner, outside of the graduated grid. English translation: Hessler 2008, p. 34.)

According to Waldseemüller, cartography provided the cognitive space to represent and conceptualize complex historical process of transformation of the world and periodization of world history marked by various milestones: the delineation of the space of Antiquity by Ptolemy in the second century AD, thirteenth-century voyages along the caravan trails of Asia, beyond the space of Antiquity, fifteenth-century Portuguese navigations along the coast of Africa, and finally the Iberian *nova reperta* across the Atlantic.

Casale, Crisostomo da

► Javelli, Giovanni Crisostomo

Casaubon, Isaac

Born: 18 February 1559, Geneva

Died: 1 July 1614, London

Nicholas Hardy

Department of English, University of
Birmingham, Birmingham, UK

Abstract

A major figure in the late humanist world, Isaac Casaubon spent his career working with ancient texts, many of them philosophical. He produced important and influential commentaries on authors such as Diogenes Laertius, Theophrastus, and Persius, but he did not formulate a distinctive philosophical program of his own. Toward the end of his career, his work became more adventurous in its scope and more explicitly normative in its functions, as it extended into the field of religious and political controversy. This development produced one of Casaubon's most important contributions to the history of philosophy: his de-attribution of the so-called Hermetic corpus.

Biography

Isaac Casaubon was born in Geneva in 1559, to Huguenot parents. He spent his early life between the town of Crest, in the Dauphiné and Geneva, whose Reformed Academy he eventually attended. This led to his first academic appointment, in 1582, and he continued to teach Greek and other ancient languages in Geneva before moving to the University of Montpellier at the end of 1596. Casaubon left Montpellier in 1600, at the invitation of the King of France, Henri IV, who had offered him a post at the University of Paris. In the end, however, Casaubon's religion prevented him from being able to take up any public teaching position, and he relied instead on a stipend granted by the French crown. After the assassination of Henri IV in 1610, Casaubon accepted the invitation of King James I of England and the Archbishop of Canterbury, Richard Bancroft, to visit London, where he resided until his death in 1614 (Pattison 1892; Considine n.d.).

Like many other humanists, Casaubon's contribution to the history of philosophy lay principally in his extensive philological and historical work on ancient philosophical texts, rather than in any particular philosophical program. However, Casaubon was not just devoted to erudition for its own sake. He believed that scholarship could complement more abstract and prescriptive forms of intellectual endeavor, even if his own ambitions to make it do so were more often thwarted than fulfilled.

Casaubon spent most of his career editing and annotating Greek and Latin texts (Parenty 2009; Glucker 1964). Among these, Diogenes Laertius's *Lives of the Philosophers* (Casaubon 1583), Theophrastus's *Characters* (Theophrastus 1592), Persius's *Satires*, and Athenaeus's *Learned Banqueters* (Casaubon 1600) gave him the most opportunities to discuss philosophical matters. However, none of them can be considered a work of philosophical argument in the strict sense, and Casaubon's commentaries do not give the impression that he was more interested in ancient philosophy than he was in literary, legal, political or cultural history. Casaubon's polymathic and indiscriminating approach to ancient

texts was reinforced by his near-unwavering preference for the commentary form over alternative publication formats that might have encouraged a tighter thematic focus. Casaubon refused to reduce or repackage his sources in the manner of his friend and correspondent, Justus Lipsius, who became known for codifying and popularizing ancient moral and political philosophy by producing accessible dialogues and collections of *sententiae*. Casaubon did, however, become a more ambitious and flexible exegete as his career went on. His later annotations on Athenaeus (1600) and Persius (1605) abound with dazzlingly compendious, essayistic treatments of difficult topics in classical scholarship, for which the passage in question is a mere starting point. The commentary on Athenaeus often touches on philosophical subjects, and the commentary on Persius provides an account of the poet's philosophical, especially Stoic influences that still commands the respect of classicists today. Yet the most philosophically ambitious commentary on an ancient author which Casaubon undertook was the one which he never finished. This was on Polybius, the historian of the early Roman republic. At least part of Casaubon's desire to edit Polybius seems to have derived from Polybius's use of Aristotelian constitutional theory to explain Rome's political and military ascendancy and from the fact that Polybius offered a republican or mixed-constitutionalist alternative to the more Tacitean, monarchical, and absolutist vision of Rome which Lipsius was popularizing. But Casaubon died before he could produce a complete commentary to accompany the edition and translation of Polybius which he had published in 1609.

At the same time as he mastered and even redefined the art of commentary, however, Casaubon was beginning to consider other generic possibilities. One of the formats pioneered by Lipsius that did appeal to him was that of the scholarly "monograph" treating a single specific topic. Casaubon proposed to write monographs on subjects as diverse as the Roman constitution, circus games and other entertainments, and the classification of colors in antiquity. One of these projected monographs, provisionally entitled *De critica*, would have reconstructed the history of

scholarship in antiquity, including sections on the ancient philosophical sects, their pedagogical practices, and institutional settings. In the end, however, Casaubon only managed to publish one example of this genre: his pathbreaking study of Greek satyr-play and Roman satire (Casaubon 1605).

One reason why Casaubon failed to produce more such works was his turn toward another mode of writing that engaged his philosophical interests in a different, and more direct, way: religiopolitical controversy. The first product of this turn was an incomplete 264-page treatise entitled *De libertate ecclesiastica*, inspired by the papal interdict placed on the Republic of Venice in 1606–1607 (Casaubon 1607). Here, Casaubon offered not only scriptural and historical but also rationalistic arguments for his own understanding of the relationship between Church and state, which was informed by the writings of the Venetian theologian, Paolo Sarpi (Cozzi 1959). In the end, however, the *De libertate ecclesiastica* was the high water mark of Casaubon's involvement with political philosophy. His later interventions in confessional debates saw him concentrate on sacred and ecclesiastical history. His last publication, the *Exercitationes* against the Roman Church historian, Cardinal Cesare Baronio (Casaubon 1614), did contain one passage of tremendous import for the history of philosophy, in which Casaubon drew on his extensive knowledge of ancient philosophical concepts and vocabulary to challenge the common attribution of the Hermetic corpus to the legendary sage, Hermes Trismegistus. Casaubon's argument prompted later scholars to produce new accounts of the relationship between pagan, Jewish, and Christian thought in antiquity. From Casaubon's point of view, however, it was a destructive exercise rather than a constructive one: he intended not to place the history of ancient philosophy on a new foundation but rather to debunk Baronio's conviction that pagans before Christ had enjoyed clear insight into Christian doctrines (Grafton 1983, 1988; Grafton and Weinberg 2011; Hardy 2017).

Casaubon's contributions to philosophy, in sum, were always intertwined with other concerns, cultural, theological, and political. In

order to understand them, it is necessary to examine his entire printed and archive *Nachlass*, from his voluminous commentaries to his correspondence (Casaubon 1709), diary (Casaubon 1850; Millet 2006), notebooks, and annotated books (Birrell 1980). This corpus has still not been studied systematically, and it presents a major opportunity to intrepid historians of Renaissance thought.

Case, John

Born: 1540/41?, Woodstock, England

Died: 23 January 1600, Oxford, England

Jonathan Woolfson

Sotheby's Institute of Art, London, UK

Abstract

John Case was the most important Aristotelian philosopher of sixteenth-century England. He demonstrates the continued vitality of the Aristotelian tradition in this period, in England as elsewhere, and in particular its eclecticism and capacity for absorbing new and humanistic currents.

Biography

John Case was an Aristotelian philosopher and physician who spent almost his entire life in Oxford. There he was a fellow of St. John's College from 1568, receiving his MA in 1572. With the exposure of his relationship with a

widow, Elizabeth Dobson, he was forced to resign his fellowship in order to marry her, which he did in 1574. He continued, however, to teach in his home and was highly successful in this. He was a member of the Oxford intellectual circle of the printer Joseph Barnes, who published his works, and he combined scholarship with medical practice, gaining an MD in 1589. He was accused both in his own time and subsequently of Catholic sympathies, but there is little solid evidence to prove this. Rather, a picture emerges of a staunch supporter of the University of Oxford, a political conservative with influential courtly connections. Case was a prolific Latin writer in the Aristotelian tradition, authoring at least ten separate works, some of which were reprinted both in England and in Germany. Although not a philosopher of the first rank in European terms, his interests were wide-ranging and his intellectual achievement significant.

Championed by the intellectual historian Charles Schmitt in a major study of 1983, Case is the prime representative of Aristotelianism in Renaissance England (Schmitt 1983). He indicates the revival of that philosophical tradition, which had been so significant in Oxford in late medieval times, and the extent of its European impact during the Renaissance. Through his success and influence as an author and teacher, he demonstrates that in England as in other European centers of learning, the Aristotelian tradition was far from being eclipsed by Renaissance humanism and Neoplatonism (McConica 1973). On the contrary, Case's flexibility and eclecticism both demonstrate ways in which this tradition continued and was revitalized by new currents. While it is all too easy to characterize Case, the suspect Catholic and critic of Machiavelli, Paracelsus, and Ramus, as old-fashioned, this neglects his tendency to absorb humanistic and other currents into his Aristotelian commentaries in the fields of logic, ethics, politics, economics, music, education, physics, and natural philosophy (Binns 1990). The result of work across these areas is a comprehensive and wide-ranging and at times humanistic updating of the Aristotelian tradition.

Casmann, Otto

Born: 1562, Warburg

Died: 1 August 1607, Stade

Peter Forshaw

Center for History of Hermetic Philosophy,
University of Amsterdam, Amsterdam, The
Netherlands

Abstract

Otto Casmann was a German humanist professor of philosophy and theology of the late sixteenth century who became an important early figure in the history of anthropology

and psychology due to his two-volume *Psychologia Anthropologica* (*Anthropological Psychology*, 1594–1596). Over the next decade Casmann published on a wide range of subjects, all of them grounded in a “Scriptural” or “Mosaic” Philosophy (Blair 2000). The first were works of natural philosophy, one on the sea and tides, *Marinarum quaestionum tractatio philosophica* (*A Philosophical Treatise on Marine Questions*, 1596), another *Cosmopoeia et Uranographia Christiana* (*Christian World-Formation and Description of the Heavens*, 1598). In the latter, Casmann refuted the sixth-century arguments of the Neoplatonist Simplicius against the biblical account of creation and aimed at eliminating the doctrine of “double truth,” in which, for example, the eternity of the world could be true in philosophy but false in theology (Lüthy 2012; Martin 2014). Casmann also published works of a more esoteric nature: his *Angelographia* (*Angelography*, 1597) appeared as a counterpart to the *Psychologia Anthropologica*, again a study of “spirited beings” (Bell 2005), but this time concerned with angelic psychology (Hotson 2007), as well as the knowledge and powers of demons (Clark 1997, 2007).

Casmanus, Otho

Biography

Casmann was born as the son of Catholic parents in Warburg, in the state of Westphalia, in 1562. Following the death of his parents, his uncle, the mayor of Warburg, Konrad von Geismar sent him to study in the gymnasium of Kassel, where he was taught by the Calvinist rector, Rudolph Goclenius the Elder (Rudolf Göckel, 1547–1628). Under Goclenius’s influence, Casmann converted to Protestantism and when Goclenius was offered a professorship in Lutheran Marburg in 1581, Casmann followed him there

to study philosophy. In 1582 Casmann enrolled at the University of Helmstedt, where he focused on philosophical and theological studies, being awarded a Masters in philosophy. It was there, attracted to the teachings of the French convert to Protestantism, the humanist logician Petrus Ramus (Pierre de la Ramée, 1515–1572) that he began lecturing on logic and criticizing the teaching of the Aristotelian system. Casmann’s first publication, albeit without his permission, appeared in 1594: *Petri Rami dialecticae et Melanchthonianae collatio* (*A Collation of the Dialectic of Petrus Ramus and of Melanchthoniana*). In 1589 Casmann joined the Trivialschule in Schüttorf, which moved in 1591 to the Reformed city of Steinfurt, where it became the academic Gymnasium Illustre, with Casmann teaching philosophy and anthropology. In 1594 he was offered the post of Rector at the new Gymnasium in the Lutheran city of Stade, where he taught philosophy and theology, specializing in logic and natural philosophy until his death in 1607 (Mahnke 1914; Hotson 2007).

In Stade, Casmann embarked on his publishing career. His first official publication was the *Psychologia Anthropologica, sive doctrina animae Humanae* (*Anthropological Psychology, or the Doctrine of the Human Soul*, 1594–1596). Writings on the soul existed from antiquity, and Philip Melanchthon (1497–1560) had been particularly influential in his own reflections on Aristotle’s *De Anima* (Kusukawa 1995). Casmann’s mentor, Goclenius, was the first to publish a work with the Greek word for psychology in its title: *ΨΥΧΟΛΟΓΙΑ, hoc est, De hominis perfectione, animo, et in primis ortu hujus* (*Psychology, that is, on Man’s Perfection, the Soul, and above all, its Origin*, 1590), an anthology of writings on the theological question of the origin of souls. Casmann’s *Psychologia Anthropologica* was the first monograph to bear the word *Psychology* in Latin (Vidal 2011). As for the other main term in his book’s title, the neologism *anthropologia* had first been coined – a Greek rendering of the term “Humanism,” as a counterpart to *theologia* – by the German anatomist Magnus Hundt (1449–1519) in his *Antropologium, de hominis dignitate*,

natura et proprietatibus (*Anthropology, on the Dignity, Nature and Properties of Man*, 1501), a work that aimed to present a synthetic vision of the human being from Greco-Roman medical traditions and Christian teaching on human nature. For Casmann, man is twofold, a *Homo duplex*, with *anthropologia* having two branches or sub-disciplines: *psychologia* (study of the mind) and *somatologia* (study of the body) (Mengal 2000). Casmann defined anthropology as “the study of human nature . . . an essence partaking of two worlds, the spiritual and the corporeal, yet united in one vehicle” (Stagl 2000), the human being conceived as neither a bodiless soul nor a soulless body, but their union in the oppositional dyad of physis and psyche. This conceptual division continued in Casmann’s *Nucleus mysteriorum Naturae enucleatus* (*Kernel of the Mysteries of Nature Explained in Detail*, 1605), where *anthropologia* is included under natural philosophy and *psychologia* under moral philosophy. Published in the same year, *Homo novus, sive spiritualis* (*The New, or Spiritual Man*, 1605) offered a “methodical anatomy and meditation on spiritual man,” derived from scripture and experience (Bell 2005; Gaukroger 2016; Gundlach 2012; Edwards 2012).

Anthropologia was, in its turn, a subdiscipline of the study of spirited beings, with its counterpart, the study of angels, developed in his *Angelographia* (1597). In this work, Casmann delved into the worlds of natural and supernatural magic, as well as Christian Cabala, with lengthy excursions on angelology and demonology (Clark 1997, 2007). Two years later saw the publication of *Astrologia, chronographia et astromanteia* (*Astrology, Chronography and Divination by the Stars*, 1599), a work in which, despite being severely critical of astrology, Casmann shows himself to be well read in the occult works of Marsilio Ficino, Heinrich Cornelius Agrippa, Girolamo Cardano, and Hieronymus Wolf (Thorndike 1941).

In religiously tolerant Stade, Casmann became a member of the charitable Brotherhood of Saint Anthony in 1598, a deacon at the Lutheran Church of Saint Wilhadi from 1601, and full-time pastor of the Benedictine Abbey of

St. Mary in 1603. His religious works include *Christliche Betrachtungen und gründlicher Beweis der Liebe Gottes in Christo Jesu* (*Christian Reflections and Thorough Proof of the Love of God in Christ Jesus*, 1599); *Lucta Peccatoris Resipiscentis in Tentationibus De Certitudine Salutis Suae adversus Diabolum, Carnem, & Mundum* (*A Sinner’s Struggle with respect to Trials concerning the Certainty of his Salvation against the Flesh, World and the Devil*, 1600); *Mundus immundus ... describitur ex piorum et doctorum scriptis, usu et experientia* (*The Impure World . . . Described from Pious and Learned Writings, Use and Experience*, 1606); and the posthumous *Anti-Socinus* (*Anti-Socinus*, 1612), against the doctrines of the Italian anti-Trinitarian Fausto Sozzini (1539–1604).

Cassirer, Ernst

Born: 28 July 1874 (Breslau, Prussia)

Died: 13 April 1945 (New York, New York)

Dustin Garlitz

Department of Philosophy, University of South Florida, Tampa, FL, USA

Abstract

This entry focuses on the Renaissance philosophy scholarship of German Neo-Kantian philosopher of culture Ernst Cassirer. The contents of his book-length contributions to Renaissance philosophy are summarized, as are his essay contributions to the field of scholarship. The motives of Cassirer's Renaissance philosophy research are highlighted, as are his original theses in the field of study. The entry also focuses on Cassirer's formative influences in the historiography of Renaissance philosophy and his impact on subsequent generations of intellectual thinkers.

Biography

Ernst Cassirer was a German Neo-Kantian philosopher. He was a leading member of the Marburg School of Neo-Kantianism, trained at the doctoral level by the Neo-Kantian philosopher Hermann Cohen at the University of Marburg. As an undergraduate, Cassirer was a student of the Neo-Kantian sociologist and philosopher Georg Simmel at the University of Berlin. Cassirer embarked on developing a philosophy of culture throughout his academic career, one that was elaborated in the tradition of the Marburg School of Neo-Kantianism. He also worked in the history of philosophy throughout his academic career.

Works and Themes

Cassirer's works as a historian of Renaissance philosophy included *The Individual and the Cosmos in Renaissance Philosophy* (Cassirer 2010), *The Platonic Renaissance in England* (Cassirer 1953), and *The Renaissance Philosophy of Man* (Cassirer et al. 1948), the latter coedited with Paul Oskar Kristeller and John Herman Randall, Jr. *The Renaissance Philosophy of Man* focused on Francesco Petrarca, Lorenzo Valla (Cassirer et al. 1948), Marsilio Ficino, Giovanni Pico della Mirandola, Pietro Pomponazzi, and Juan Luis Vives. *The Individual and the Cosmos in Renaissance Philosophy* (Cassirer 2010) focused on Nicholas Cusanus, Leonardo da Vinci, Galileo Galilei, Pico, Francesco Patrizi, and Giordano Bruno. Cassirer critically confronted the philosophical tradition of the Renaissance in his work, pairing it with a critical engagement of the mathematical and scientific knowledge from the era.

Cassirer published journal articles and reviews of Renaissance philosophy throughout his academic career as well. His review of Paul Oskar Kristeller's *The Philosophy of Marsilio Ficino* was published posthumously in the *Journal of the History of Ideas* in (Cassirer 1945). He wrote a two-part essay on Pico, published in (Cassirer 1942a, b), also in the *Journal of the History of Ideas*. His coauthored essay titled "Some Remarks on the Question of the Originality of

the Renaissance" was published in the same venue 1 year later.

Original Aspects

In some cases, Cassirer studied the Renaissance together with the Enlightenment in his history of philosophy scholarship. Not only did Cassirer apply history of philosophy scholarship to the Renaissance, his philosophical anthropology was developed, in part, from the historical period and its philosophers' works. In such a sense, his overarching critique of culture was applied to Renaissance philosophy, as demonstrated in his works such as *The Renaissance Philosophy of Man* (Cassirer et al. 1948) and in selected portions of *An Essay on Man* (Cassirer 1968). Cassirer's historiography of Renaissance philosophy was in part influenced by older traditions of scholarship in continental European intellectual life, including that pursued by historian Jacob Burckhardt in works such as *The Civilization of the Renaissance in Italy*, which had been published in 1860. In Cassirer's book on Pico, Patrizi, Ficino, Bruno, and others, he presented these Renaissance philosophers as historical precursors to G.W.F. Hegel's philosophical system.

Legacy

Cassirer broadened Burckhardt's method of inquiry in the history of Renaissance scholarship by investigating the philosophical basis and source of individuality in these thinkers' works. In the final chapter of Cassirer's book *The Platonic Renaissance in England* (Cassirer 1953), he argued that historical receptions of the Renaissance would continue to remain incomplete unless considered was the idea that the notion of the comic was a central part of the first and greatest victories of the Renaissance spirit (Cassirer 1953; Brandist 1999). Accordingly, Cassirer was motivated by evaluating how Renaissance philosophy engaged and treated humor. This Renaissance philosophy scholarship of his influenced the work of contemporary cultural theorist Mikhail Bakhtin.

Castelein, Matthijs de

Born: ca. 1485

Died: 1550

Eva van Hooijdonk

Faculteit der Letteren, Vrije Universiteit
Amsterdam, Amsterdam, The Netherlands

Abstract

The Flemish rhetorician Matthijs de Castelein (1485–1550) is best known for his *Art of Rhetoric* of 1555. It was the first art of rhetoric in the Dutch language, and although De Castelein propagates a traditional, medieval poetry, he tried to relate this kind of poetry with classical poetry and this way paved the way for a humanist approach of rhetoric and poetry.

Biography

Matthijs de Castelein was born around 1485 in Oudenaarde, where he visited the Latin school. He settled as a priest and notary in Pamele, near Oudenaarde in 1516, and kept these posts until the end of his life. De Castelein was the *factor* (leading poet) of two Chambers of Rhetoric: of the *Kersauwe* (Daisy) from Pamele and of *Pax Vobis* from Oudenaarde. In this function, he composed many poems and plays, for which he was widely renowned in Flanders, but his most important work was the *Const van Rhetoriken* (Art of Rhetoric).

De Castelein's Art of Rhetoric

The *Const van Rhetoriken* (*Const*) was first published by Jan Cauweel in 1555, 5 years after De Castelein's death, and saw its sixth and final reprint in 1616, which illustrates its continuing popularity among Dutch rhetoricians, even after the publication of more humanist Dutch poetics.

The *Const van Rhetoriken* was the first Dutch vernacular Art of Rhetoric. It is shaped as a true rhetoricians' poem, consisting of 239 stanzas of 9 verses. De Castelein intended it as a manual for the beginning Flemish rhetorician, modeled after the French *Arts de Seconde Rhétorique*. De Castelein explains every aspect of the technicalities of composing a poem extensively, like rhyme, rhyme schemes, and different forms of lyrical genres. Every aspect of every rhetorician's genre is illustrated with several poems by De Castelein himself.

Innovative and Original Aspects

The most innovative aspect of the *Const van Rhetoriken* is, however, the way in which De Castelein is able to relate his own rhetorical art to classical rhetoric. As much as 27% of his *Const van Rhetoriken* consists of quotations from Quintilian's *Institutio oratoria*, Cicero's *De oratore*, and Horace's *Ars poetica*. He adopts their ideas on decorum and on the education and personality of the rhetorician, describing the ideal rhetorician as a virtuous and learned man, who spends his spare time reading learned poetry.

But not only in his ideas on rhetoric, in general, does De Castelein turn to Antiquity. For every rhetorician's genre of poetry, he tried to find a classical counterpart as well, this way legitimating his art. De Castelein states, for instance, that the epigrams of Martial are the Latin forerunners of the rhetoricians' ballads and that the rondel is the Flemish equivalent of Horace's odes.

With his *Const van Rhetoriken*, De Castelein is capable of relating his *Seconde Rhétorique* to classical rhetoric and poetry and this way created the first defense, and at the same time the first manual, for early modern Dutch poetry.

Castellani, Giulio

Born: 1528, Faenza

Died: 23 October 1586, Roma

Olivier Dubouclez

Department of Philosophy,

University of Liège, Liège, Belgium

Abstract

Giulio Castellani was an Italian nobleman, Aristotelian scholar, and clergyman born in Faenza, Italy, who is mostly known for his *Adversus M. Tullii Ciceronis academicas quaestiones disputatio* (1558) where Castellani defended dogmatic Aristotelianism against Cicero's *Academica* and Skepticism in general as exposed by the influential humanist Francesco Pico della Mirandola. Castellani

also published a book entitled *De humano intellectu libri III* in Bologna in 1561, where he gave an important contribution to the controversy on the immortality of the soul raised by Pomponazzi and Averroism. In this book, Castellani favors Alexandrist positions against the trend of Simplician Averroism defended by the Paduan scholar Marcantonio Genua. As a professor, Giulio Castellani taught at the *Accademia degli Invaghiti* in Mantua where he lectured on Aristotle's *Ethics* at the beginning of the 1560s. At the end of his life, he received the chair of philosophy at the Sapienza University in Rome. Castellani also developed an important career in Italian religious institutions. Named Canon of the Cathedral of Faenza by Pope Pius V in 1571, he was later appointed Bishop of Cariati (Calabria) by Pope Sixtus V, but he died in October 1586 just before being consecrated.

Alternate Names

Castellanus, Julius; Castellanus, Iulius; Castellanius

Biography

Giulio Castellani was born in 1528 in Faenza, a city located in Northeastern Italy in a family pertaining to the old nobility. He was the nephew of Pier Nicola Castellani, a physician, teacher, and philosopher who, among various treatises, published a *De immortalitate animorum secundum Platonem et Aristotelem* in 1525. As a young man, Castellani devoted himself to the study of Humanities, first in Faenza under the supervision of the orator Sebastiano Regoli da Brisighella and then pursued his education at the University of Ferrara, benefiting from the courses of Vincenzo Maggi. He took part to the foundation of the *Accademia degli Invaghiti* in Mantua in 1562 where he lectured on Aristotle's *Ethics*. From 1560 onwards, his career in ecclesiastical institutions developed as he was named Canon of the Cathedral of Faenza by Pope Pius V in 1571.

He moved to Rome in 1577 under the request of Gregory XIII where he received the chair of philosophy at the Sapienza University. Appointed Bishop of Cariati (Calabria) by Pope Sixtus V, Castellani died in October 1586 just before being consecrated (Schmitt 1978).

Apart from a vast correspondence that is largely unedited (with prestigious correspondents like Ulisse Aldrovandi, Carlo Borromeo, or Federico Pendasio), a few poetical works and a book on the miracles of the saints published in 1569, Castellani's contribution to philosophy amounts to two treatises published early in his career. "A work nearly unique in the Italian Cinquecento" (Schmitt 1972), his *Adversus M. Tullii Ciceronis academicas quaestiones disputatio* published in Bologna in 1558 is a defense of dogmatic Aristotelianism against Cicero's *Academica* and skepticism in general as exposed by Francesco Pico della Mirandola in his *Examen vanitatis doctrinae genitum* of 1520 (Schmitt 1967). While this first opus entails an interesting use of experience and observation, his *De humano intellectu libri III*, published in Bologna in 1561, is a contribution to the controversy on the immortality of the soul raised by Pomponazzi and Averroism (Mahoney 1970; Kessler 1988). In this book, Castellani's position is more original, favoring Alexandrist positions against the trend of Simplician Averroism defended by Marcantonio Genua. While he identifies the Agent intellect with God, Castellani nonetheless holds the human intellect as a substance endowed with real cognitive power, a claim that pushes him to reduce the Agent Intellect to a distant cause of the actualization of forms inherent to the human mind, presenting then a "moderate innatism" (Spruit 1995). In the same context, he develops a naturalistic epistemology which amounts to immersing the human intellect within duration, giving an important contribution to a debate about the instantaneousness of intellectual acts, and more generally about the temporal nature of thought, which is carried on by Antonio Montecatini and also Francesco Piccolomini at the turn of the sixteenth and seventeenth centuries (Dubouclez 2015).

Castiglione, Baldassare

Born: 6 December 1478, Casatico, Near Mantua

Died: 8 February 1529, Toledo

Annick Paternoster

Istituto di Studi italiani, Università della Svizzera italiana (CH), Lugano, Switzerland

Abstract

Baldassare Castiglione, an Italian courtier and diplomat for the dukes of Urbino and for the Roman Curia, is the author of *The Book of the Courtier* (*Il libro del cortegiano*), a courtesy book examining social interaction between gentleman, ladies, and their rulers. It was published in 1528 to immediate international acclaim.

Biography

Castiglione was born in the Margravate of Mantua; via his mother he was related to a lesser branch of the Gonzaga family. When he was a teen, he was sent to Milan, where he received a humanistic education. Back in Mantua, he entered the service of the Marquis, but in 1504 he transferred to the Montefeltro court of Urbino, a vibrant epicenter of Renaissance culture, where he stayed until 1513, befriending among others, Pietro Bembo, Bernardo Bibbiena, and Raphael, who famously painted his portrait (Fig. 1). He carried out important diplomatic missions (e.g., to England in 1506) and became Urbino's ambassador in Rome. Made a widower in 1520, he took minor orders and entered the service of the Roman Curia: in 1525 he was posted as a papal nuncio at the court of Emperor Charles V in Spain, where he remained till his death, facing sharp criticism about his failure to prevent the Sack of Rome. His diplomatic career

is typical of how the Italian nobility was trying to cope with the rapid erosion of the peninsula's political clout by choosing career paths that lead to Rome, the only political center deemed capable of exerting a European influence.

Heritage and Rupture with the Tradition

Set at the court of Urbino, during four evenings in the spring of 1507, *The Book of the Courtier* discusses the qualities of the ideal courtier in dialogue form, closely imitating Cicero's *De Oratore*, whose interlocutors are well-known contemporary orators (Castiglione 2002, 2016a). Likewise, Castiglione's characters are exemplary courtiers and ladies who live at the court in Urbino: this courtesy book is as much trying to teach courtly behavior through the content of the discussions as through dialogic form itself: a

witty, lively display, sometimes heated, but never aggressive nor pedantic, and always tending toward agreement (Cox 2008). Whereas topics such as the use of vernacular language and the virtue of women provoke intense debate with rapid turn-taking, the qualities of the courtier and his lady, the nature of grace, and the service to the prince are presented in continuous speech, which contains entertaining examples and is occasionally interrupted by questions, comments, and objections. The dialogue culminates in Pietro Bembo's passionate monologue in defense of Neoplatonic love. Castiglione's dialogue, thus, can be read as an exemplary performance of conversational rhetoric (*sermo*).

Innovative and Original Aspects

The ideal courtier is virtuous but at the same time perfectly in control of his performance at court,

pursuing both ethical and aesthetical aspirations. The most innovative aspect of the *courtier* is that perfect behavior is situated at the crossroads of rhetoric and practical ethics. A reader of both Cicero's *De Oratore* and *De Officiis*, Castiglione firmly grounds the courtier's central quality, gracefulness (*grazia*), in decorum, i.e. the capacity to discern (*discernere*) – with judiciousness (*giudicio*, *discrezione*) – every single circumstance and to choose – with prudence (*prudenza*) – the most appropriate behavior (Saccone 1992). Appropriateness, or measure, is effectively an art to achieve grace for those who are born without it; however, to convince peers and prince alike of his true nobility, the courtier needs to hide the art behind grace: *sprezzatura* or effortlessness, the art of dissembling one's efforts, is rooted in the rhetorical figure of dissimulation and is ultimately the art to persuade the audience of one's innate nobility (Whigham 1984; Snyder 2009). The *Courtier's* fortunes as a courtesy book are probably linked to the presence of this encompassing rule, an adaptable tool to navigate complex life at court.

Impact and Legacy

Taking 15 years to complete *the Courtier*, Castiglione produces three full manuscripts (Motta 2003). The publication was eagerly anticipated, and unauthorized copies had started to circulate, prompting the author to a hasty final revision. The book was published in 1528 by the most prestigious publishers of the time: the Aldine press in Venice and, a year later, the Giunti of Florence (Quondam 2000) (Fig. 1). The text became a European bestseller, with as many as 115 publications and translations even before 1600 (Burke 1995). It was very quickly translated into Spanish (1534) and into French (1537), with other languages following soon after: Latin and English (1561) and German (1565). Castiglione's *Courtier* became the ultimate conduct book for court life during the ancien régime, a blueprint for its aristocratic role models such as the gentleman and the *honnête homme*.

Castiglione also leaves an impressive body of just under 2000 letters, consisting of familiar and diplomatic letters, an important testament of the conversational spirit of Renaissance court life (Castiglione 2016b).

Cataldi, Pietro Antonio

Born: 15 April 1552, Bologna

Died: 11 February 1626, Bologna

Lorenzo Filippo Bacchini

Department of German and Roman Languages
and Literatures, John Hopkins University,
Baltimore, MD, USA

Abstract

Pietro Antonio Cataldi was an Italian Renaissance mathematician. He was born in Bologna, in 1552, and he started teaching very young in Florence and in Perugia and finally went back to Bologna, where he held the position of professor of mathematics and astronomy until his death, in 1626.

Cataldi devoted his life to diffuse the mathematical culture, and for this reason, he chose to teach and write his works in Italian rather than in Latin, and he printed at his own expense and distributed for free to poor students his most didactical works.

He wrote around 30 books on mathematics and some on other topics. He contributed to the theory of Euclidean perfect numbers, discovering the sixth and seventh of the perfect numbers and the sixth and seventh of the Mersenne prime numbers, and he offered a notable contribution to the development of infinite algorithms. His works, all published in Bologna between 1602 and 1626, represented an important advancement to the Renaissance mathematical thought and a perfect documentation of the mathematical knowledge of his time.

Biography

Pietro Antonio Cataldi was an Italian Renaissance mathematician. He was born in Bologna, at that time part of the State of the Church, in 1552. The information concerning his life is few, but we

know he was educated in Bologna, although he does not seem to have attended the university there. He started teaching in Florence at the *Accademia del Disegno* from 1569 to 1570 and then moved to Perugia, where he taught mathematics both at the University of Perugia and at the *Accademia del Disegno*. In 1584 he returned to Bologna where he was awarded a doctorate in philosophy and medicine, and the Studio of Bologna offered him the teaching position in mathematics and astronomy left open in 1583 by the departure of Ignazio Danti, who became Bishop of Alatri. He held the position for almost 40 years until his death, in 1626. Cataldi devoted his life to diffuse the mathematical culture in Bologna. He chose to teach and to write his works in Italian rather than in Latin, enabling in this way many people to benefit from his teaching. He printed at his own expense and distributed for free some of his didactical works, and he also tried to set up an Academy of mathematics in Bologna, but a ban by the Bologna Senate closed it after the first meeting. When he died, in 1626, after a life spent studying and teaching, he left his money to set up a school in his own house, but this does not seem to have happened either (see Bortolotti 1931; Carruccio 1970–1990; De Ferrari 1979; Fantuzzi 1781–1794; Mazzetti 1848; Riccardi 1870–1880; Simeoni 1940; Tiraboschi 1780).

Cataldi wrote around 30 books concerned with theoretical and practical arithmetic, algebra, geometry, military engineering, and astronomy. He wrote on arithmetic publishing, in four parts between 1602 and 1617, *Pratica aritmetica ovvero elementi pratici delli Numeri aritmetici*, a manual for school use dedicated to the Senate of Bologna, which he printed at his own expense and distributed for free to poor students of monasteries and schools in the area. Along his life, he also published an edition of Euclid's *Elements*, between 1613 and 1625, and working on Euclid's fifth postulate, he attempted to prove the postulate was a consequence of the other four in *Operetta delle linee rette equidistanti et non equidistanti* (1603). The work was dedicated to the mathematicians of Bologna and distributed to them for free (see De Ferrari 1979; Kline 1972; Loria 1950;

Orlandi 1714; Riccardi 1870–1880; Tiraboschi 1780).

He is, however, best known for his work on perfect numbers and on continued fractions. His most important works on these topics were *Trattato de' numeri perfetti*, published in 1603 but already composed in 1588 and stolen from him, and *Trattato del modo brevissimo di trovar la radice quadra delli numeri*, published in 1613. The first work was a contribution to the theory of Euclidean perfect numbers originated as a response to the work of the French mathematician Charles de Bovelles. In it, he published his discoveries of the sixth and seventh of the perfect numbers (8.589.869.056 and 137.438.691.328) and the sixth and seventh of the Mersenne prime numbers (corresponding to $p = 17$ and $p = 19$ in the formula $M_p = 2^p - 1$), holding the record for the largest known prime for almost two centuries. In the second work, elaborating theories dating back to Hero of Alexandria (10–70 A.D.) and reflecting on the recent work of Rafael Bombelli (1526–72), he calculated the square root of numbers through the use of infinite arithmetic progressions and unlimited continued fractions, offering a notable contribution to the development of infinite algorithms. The book, dedicated to Bologna's Senate, applied algebra to military operations, specifically to problems related to the range of artillery (see Bortolotti 1919–1920, 1939; Favaro 1874; Gunther 1874; Kline 1972; Loria 1950; Maracchia 1976).

Among his other works, it is worth to mention *Trattato dell'algebra proportionale* (1610); *Transformatione geometrica* (1611), dedicated to the Grand Duke of Tuscany Cosimo II de' Medici; *Trattato della quadratura del cerchio* (1612), a book on squaring the circle; *Aritmetica universale* (1617); *Operetta di ordinanze quadre di terreno et di gente* (1618), a book concerned with the application of algebra to military formations; *Regola della quantità, o cosa di cosa* (1618); *Nuova algebra proportionale* (1619); *Difesa d'Archimede, trattato del misurare o trovare la grandezza del cerchio* (1620); *Elementi delle quantità irrazionali, o inesplicabili*

necessarij alle operazioni geometriche et algebraiche (1620); *Algebra applicata, dove si mostra la utilissima applicazione d'essa alla invention delle cose recondite nelle diverse scienze* (1622); and *Difesa d'Euclide* (1626) (see De Ferrari 1979; Fantuzzi 1781–1794; Kline 1972; Loria 1950; Orlandi 1714).

Catena, Pietro

Born: 1501, Venice/Italy

Died: 1576, Padua/Italy

Michele Camerota

Department of Pedagogy, Psychology,

Philosophy, University of Cagliari, Cagliari, Italy

Abstract

Professor of mathematics at the University of Padua, Catena is significant for being one of the authors who contributed to a debate pertaining to the certainty of mathematics, known as *quaestio de certitudine mathematicarum*. The debate mainly focused on the relationship between mathematics and syllogistic logic. Catena defended the certainty of mathematics, maintaining that mathematical demonstrations were superior to syllogisms as tools to acquire knowledge.

Biography

Little is known about Catena's life, only that he taught mathematics at the University of Padua from 1547 to his death in 1576. In alternating years Catena lectured on mathematics texts (the *Elements* of Euclid) and astronomical texts (Sacrobosco's *Sphaera* and the *Geography* of Ptolemy). He also lectured on mechanics. Guidobaldo del Monte and Bernardino Baldi, two of the most prominent authors of mechanical treatises of the age, attended Catena's

lessons on pseudo-Aristotelian *Mechanical Problems*, respectively, in 1564 and in 1573. They both expressed a low opinion of Catena's teaching.

Pietro Catena died from the plague in 1576.

Innovative and Original Aspects

Catena's most important works are related to the debate on mathematical certainty. In that context, he tried to develop a Platonic reading of Aristotle's logical works (Catena 1556, 1561b).

In accordance with his Platonic attitude, Catena viewed mathematical objects as universal intelligibles existing in the intellect. As such, they do not depend on the senses and cannot be derived via abstraction from particulars, but are known to us through a pure rational process.

Remarkably Catena believed that those ideal, purely rational entities (i.e., the mathematical objects) played a role in acquiring a scientific knowledge of the natural world. In fact, particular things of the perceived world also participate in a universal nature. Starting from the premise that mathematics allows us to recognize universal (i.e., geometrical) properties of empirical individuals and since "science is the knowing of the universal" (Catena 1556: 97), one must conclude that mathematics is able to transform particular things into scientific objects. Hence, a true knowledge of the empirical world can only be possible through the application of mathematical procedures.

From this point of view, Catena affirmed, in general, that mathematical disciplines were "most certain" (*certissimae*), and for this reason "they are usually used to give light and certainty to the other parts of philosophy, both speculative and practical" (Catena 1563: 2v).

While defending the epistemological value of mathematics, Catena also emphasized the power of its demonstrative procedures. He maintained that geometrical demonstrations were different from the most powerful form of syllogistic demonstration (the so-called *demonstratio potissima*). Unlike syllogisms, mathematical demonstrations had heuristic capacity, as they could provide us with new truths.

In his work on method (*Oratio pro idea methodi*), issued in 1563, Catena also praised the excellence of mathematical method, which he identified with “the very same Idea of method.” In his words: “You can see how admirable is the order by which mathematics is treated, considering that [...] mathematics itself is used as a perfectly similar model of the Idea of Method, or rather as the very same Idea of method” (Catena 1563: 6v).

Cattani da Diacceto, Francesco

Born: 1466

Died: 1522

Eva Del Soldato

Romance Languages/Italian Studies, University of Pennsylvania, Philadelphia, PA, USA

Abstract

Francesco Cattani da Diacceto was the most beloved student of Marsilio Ficino and a leading personality in Florentine cultural and political life at the beginning of the sixteenth century. Despite his clear preference for Platonism, he was also trained in Aristotelian philosophy. His most important works are devoted to the problems of beauty and love, framed in a canonical Neoplatonic structure. He was also interested in literary and linguistic matters, as testified by his participation in the meetings of the Rucellai Gardens and his network of correspondents, which included Pietro Bembo, Girolamo Querini, and Gian Giorgio Trissino.

Alternate Names

[il Diacceto](#); [il Ghiacceto](#); [il Pagonazzo](#)

Biography

Cattani was born in Florence in 1466 into an ancient and prosperous family. From 1487 he studied in Pisa under Oliviero Arduini, an Aristotelian who also cultivated an interest in Plato. Cattani never finished his university studies, and in 1492 he returned to Florence, where he joined the circle of Marsilio Ficino. During this period, and after Ficino's death, Cattani taught several courses on Aristotelian philosophy, first in the Studio Fiorentino and then at the University of Pisa. He attracted the attention of Gasparo Contarini, who repeatedly attempted –

unsuccessfully – to bring him to the University of Padua (Jedin 1959). In the meantime, Cattani began corresponding with Pietro Bembo and Girolamo Querini, a relationship that was probably born out of their common association to the Camaldolese order (Lackner 2002), and he became a prominent member of the circle of the Orti Oricellari (the Rucellai Gardens) where he exercised a strong influence on younger Florentines and met Gian Giorgio Trissino, who greatly admired him. He also associated with the members of the Accademia Sacra, where he entered into contact with Michelangelo, who may have been influenced by his doctrines. Cattani even held important public offices after the return of the Medici to Florence: a few months before his death, he was named Gonfaloniere di Giustizia.

Cattani had a deep knowledge of Aristotelian philosophy because of his own intellectual formation and his experience as a teacher. His attitude toward the relationship between Aristotle and Plato, a subject of intense debate at the time, is therefore complex. According to Cattani, modern philosophers abused Aristotle, distorting his ideas and neglecting Plato. Cattani reacted by attempting to revive Platonic doctrines and arguing that Aristotle and Plato in fact agree on almost everything, in particular on the existence of demons, the fifth essence, and even the immortality of soul (Kristeller 1946). Nonetheless, Cattani was probably interested in demonstrating the harmony between Plato and Aristotle only insofar as it helped to legitimize Platonism. Cattani never composed a treatise devoted to the harmony between Plato and Aristotle, despite having announced several times that he would do just that, and he rejected the solution offered in the *De ente et uno* by Giovanni Pico della Mirandola (with whom he polemicized on more than one occasion). When engaging with another *vexata quaestio*, the relationship between Platonism and Christianity, Cattani emphasized the similarities between the two, but when they conflicted declared that Christian truth was inevitably superior. Cattani was nonetheless very faithful to Neoplatonic exegesis, to the extent of not including in his works the innovations proposed by Ficino. His

ideas are expressed in texts related to his university lessons (paraphrases and prolusions); in his letters; in the *Panegyricus* (ante 1508) and the *De amore* (1508), of which Cattani made a vernacular version as well (*Panegirico allo amore* and *I tre libri d'amore*, both around 1511); and, mainly, in his most significant work, *De pulchro* (1496–1514). In the *Panegyricus*, *De amore*, and *De pulchro*, Cattani argued for the traditional Platonic association between exterior beauty and interior goodness. Following Ficino's exegesis of the *Symposium*, Cattani advocated physical beauty as the first step toward the divine, despite the fact that the celestial grace has to be sought in the angelic nature, and not above, because the One is deprived of beauty for its absolute simplicity. This motif is recovered, as Cattani himself declares, from Plato's *Parmenides* and from the negative theology of Dionysius the Areopagite. The motion of the soul from beauty to God is what we call love, and the soul itself is the knot of the universe, which must maintain an equal distance from the Angel – which is superior – and the body, which is inferior. According to Cattani, therefore, the human soul is of an ambiguous nature, capable of inclining up or downward.

None of Cattani's works were printed during his lifetime, though numerous copies circulated in manuscript form. The fact that Cattani never published anything while alive, together with the imposing presence of Ficino as a teacher of Platonism, significantly limited the influence of his philosophical doctrines in both the short and the long term. Apart from Florentine Platonists (such as Francesco Verino the Elder) and a handful of exceptions (most notably Mario Equicola, Baldassare Castiglione, and, at the end of the century, Francesco Verino the Younger and Paolo Beni), Cattani is usually assigned a marginal role, even in contemporary lists of authors who wrote on love. Nonetheless, the degree of posthumous fame that Cattani did not receive as a philosopher was granted to him as a vernacular author (Del Soldato 2013). In the 1550s, the vernacularizations of the *Panegyricus* and *De amore* gained the admiration of a number of members of the Accademia Fiorentina: this renewed

interest in Cattani led to the publication of a printed edition of his works, edited by *accademici* like Frosino Lapini, Benedetto Varchi, and Francesco Cattani the Younger (a grandson of the philosopher). Among the members of the Accademia, Cattani was evidently regarded as a pioneer because of his early interest in the vernacular, an interest which was founded on a reasoned attempt to reconcile the linguistic theories of Aristotle and Plato. In the dedicatory letter to the *I Tre libri d'amore*, Cattani had in fact stated that since exterior discourse is an image of interior discourse, which is universally immutable, there is no reason why one exterior artificial language should be preferred to another. That is why secrets of philosophy cannot be expressed more appropriately in Latin or Greek rather than in *volgare*, since the choice of writing philosophy in the vernacular does not imply a renunciation of its elitist character: philosophy is selective by nature, regardless of the language used to express it.

Abstract

How providence correlates with free will and the divine agrees with the natural order have been the foundational issues of Christian teaching. Owing a great deal to ancient discussions on fate and causality, Christian theologians adjusted the notions in hand to meet their needs. In the Renaissance, an alleged connection between a divinely structured universe and the causes of terrestrial events was put into question. There were two main reasons for that. First, the late fifteenth and early sixteenth centuries witnessed a revival of the philosophical ideas that challenged the Aristotelian teaching on the four causes. On the other hand, contemporary scientific developments shook belief in the harmonious design of the universe.

Heritage and Rupture with the Tradition

Most ancient thinkers suggested that the world was structured in a harmonious manner. This consequently implied that events of the terrestrial world, regardless of their effects, are in relation to the divine design of the universe. It was believed that the divine influenced two main instances, for a long time seen inseparable from each other: human existence and nature. The most famous doctrine deriving from this assumption was concerned with the theory of microcosm/macrocosm. It stated that macrocosm manifests itself in the image of microcosm, while microcosm reflects the structures of its supernatural prototype. A cosmic soul, which has the immanent God as its origin and model, illustrates this idea

most clearly. Based on this premise, ancient thinkers explained causality accordingly and applied the argument to, among other things, medicine and music. Thus, Pythagoras was thought to have found a link between musical consonances or harmonies and mathematical proportions, which underlay the belief in universal harmony. Developed in Plato's dialogues, mostly in the *Timaeus* and in the famous myth of Er in the *Republic*, the music of the spheres later became a widespread notion among medieval and Renaissance thinkers (Prins and Vanhaelen 2018). Similarly, stressing the connection between the soul and the body, Hippocrates and those who followed his teaching argued that the human body consists of four substances (or humors), which, when imbalanced, cause bodily diseases. Along with being related to particular elements, the substances, Hippocrates postulated, correspond to, and determine, human temperaments. Hence, disease is to be cured by reinstating the balance within its cause, a patient's soul (Nutton 2004). As a result, this conception had long-standing implications since it established a strong link between medicine and philosophy, which remained in place until the seventeenth century.

Aristotle contributed to the problem of causality in his own right (Falcon 2005). In opposition to Plato's theory of forms, which asserted that a whole variety of things existed exclusively in the intelligible realm and not in the physical world, Aristotle put forward his causal explanation of being centered on four elements: (1) matter, or the material cause, of which things are composed; (2) form, or the formal cause, which transforms matter into a particular thing; (3) agent, or the efficient cause, which is responsible for making changes; and (4) and the final cause, to which everything is leading. After the prime mover provided the physical world with motion, nature in its entirety is subject to constant change. As regards teleology or final causality, it was labeled as the Good – something which Christian theologians subsequently adopted for their purposes, indicating that the whole multitude of things is driven through to accomplish the divine design.

Another problem related to causality and widely debated in antiquity was *fatum*. Suffice it to recall Sophocles' *Oedipus Rex* or Seneca's *Letters to Lucilius*, which, despite having been written in completely different contexts and periods, insist on the deterministic character of human life and insist on one's full acceptance of the fruits of *heimarméne* (destiny, fate), either malign or benevolent. Despite the remarkable impact Stoicism had on contemporary thinking, some of the prominent ancient philosophers refused to uncritically accept the fatalistic interpretation of human destiny. Among those who proposed alternative approaches to fate, Plotinus and Alexander of Aphrodisias are to be mentioned *in primo loco*.

Plotinus polemicized with the Stoic tradition rather than with particular Stoic philosophers of the time. While demonstrating refined expertise in Stoicism that he considered being the most dangerous form of "anti-Platonism," Plotinus denounced Stoic materialism and epistemology. This consequently brought him to the Stoic notion of universal causality to which he opposed the providential governance of the universe combined with God's goodness. According to Plotinus, it left room for a human being to reject the fruits of evil passions and turn the soul toward to the Good, thus allowing them to take personal, seen as primarily moral, responsibility for their actions (Rist 1967; Gerson 2016). Plotinus goes on to say that external elements occasionally interpreted as the causes of events, such as the position of the stars and planets, are to be regarded exclusively as signs of providence's involvement in the terrestrial world (Barton 1994; Adamson 2008). Plotinus' position on fate and fatalistic astrology was rediscovered in the Renaissance and influenced, among others, Marsilio Ficino (Vanhaelen 2007).

Apart from the Neoplatonic attack, Stoic teaching on the causal chain was subjected to criticism by the Peripatetic school personified above all in the figure of Alexander of Aphrodisias. The fascination for astrology and other deterministic theories in Rome, at the court of the emperor Septimius Severus and his heirs, led Alexander of Aphrodisias to write his

famous treatise *De Fato*, well known in the Middle Ages thanks to William of Moerbeke's translation (Alexander of Aphrodisias 1983). There, Alexander opposed the Stoic idea of determinism, claiming that there were no pre-determined causes for terrestrial events. He insisted that human beings were responsible for their own decisions and that chance was a source for human freedom since it allowed the breaking of a casual chain. Later in the Renaissance, Pietro Pomponazzi dismissed Alexander's interpretation in favor of a deterministic design of the universe, which he put in line with the negation of the immortality of the soul (Pomponazzi 2004). Finally, the Epicurean teaching firmly rejected the causal chain for the random movement of atoms, which, among other things, accounts for human free will.

Of the variety of ancient responses to causality, Christian teaching adopted some elements of Stoicism, at the same time denying determinism. What Christians were inclined to admit was acceptance, to a certain extent, of the fruits of fate considered as manifestations of the divine will. God might direct someone toward salvation through ordeals that test and verify their faith. Thus, in a significantly modified and Christianized version, the Stoic view of fate and causality resurfaced in later theological writings. It is worth noting that several ancient thinkers' deeds and texts were often reinterpreted from a Christian perspective. The most famous case of such a conversion is Virgil, whose *Eclogue IV* was believed to have predicted the birth of Christ. Stoic philosopher Seneca went through the same transformation. Jerome and Augustine, as well as later scholars and theologians, such as Jacobus da Voragine, all praised him as one of the most prominent writers who foresaw the rise of Christianity. This image of Seneca as a pre-Christian saint was reinforced in the early Renaissance.

The other substantial problem to which Christian theology had to respond was the relationship between divine providence and free will. Forged in the heated controversy with the followers of Pelagius, the Catholic Church's position was developed by Augustine (Teselle 2014).

According to the Church father, and in contrast to Pelagius' teaching, free will that provided humans with an ability to choose good over evil was insufficient to obtain salvation. To turn them to the right path, God, as the Supreme Being that controlled and governed upon the universe, might intervene in the life of people and grant them the gift of divine grace. The latter, which implied divine providence, did not deny free will but by its importance undoubtedly exceeded all other divine gifts and led people to salvation. Later advanced in medieval scholasticism, receiving its full justification in Thomas Aquinas' *Summa Theologiae*, the Augustinian theory presented a famous dilemma: although the soul kept control of its actions, God was aware of what choice it was inclined to make and, therefore, might act to direct it, without, again, compromising free choice. In the sixteenth century, John Calvin adopted Augustine's concept to develop his own doctrine of double predestination and predestined salvation (Hesselink 2004).

As for the natural order, in Christian theology God is believed to be the sole creator of the universe *ex nihilo*, with the physical world predestined to an end, which is expected to coincide with Jesus' Second Coming. Regardless of the eschatological perspective, nature is seen as an evident manifestation of divinity. After the twelfth century, when numerous previously unknown manuscripts were translated in Spain and Sicily, including, *in primis*, Aristotle's writings, the Stagirite's theory of four causes supplemented the Catholic teaching on divine creation and provided medieval thinkers with a philosophical framework to further the study of nature. The teaching of Aristotle, usually through the lens of his "Commentator," Ibn Rushd (or Averroes in the Latin West), subsequently became part of the university curriculum. This opened Pandora's box eventually resulting in the famous Paris condemnation of 1277, which abolished Aristotle's natural philosophical writings from Sorbonne as they were thought to contradict the Catholic doctrine on nature. Étienne Tempier's decree put an end to a confrontation between the faculty of theology and that of liberal arts in Paris (Piché 1999). However, it did not prevent Aristotle's thought from disseminating

across Europe: thus, after 1277, Padua took over from Paris as the intellectual center of Aristotelianism. Within a broader European context, as some scholars believe, the Paris condemnation signifies the beginning of philosophy as an independent area of knowledge devoid of theological implications and initially perceived as a non-theological study of nature.

The rediscovery of Aristotle also played a crucial role in the legitimization of occult knowledge (De Libera 1991; Pompeo Faracovi 1996; Boudet 2006; Federici Vescovini 2008). As is known, the medieval West was flooded with a large number of texts attributed to, but in fact not written by, Aristotle. By capturing a distorted metaphysics of Aristotle, astrologers and alchemists, first in the Islamic world and later in medieval Europe, had sought to adapt in a modified way and then managed to misinterpret the rest of Aristotle's legacy, including his natural philosophy. They created a phantom of Aristotelianism since, along with the corpus of his original texts, including *Physics*, *De Caelo*, and *Meteorologica*, three-quarters of the writings attributed to Aristotle at the time were not by him. The most important texts of this list were the *Liber de Causis* and the *Secretum Secretorum*, both extremely popular in the Middle Ages in the West. Thus, through Aristotle's authority and these translations, mainly of pseudo-Aristotelian texts, occult disciplines, such as astrology and alchemy, were accepted. Astrology was taught at medieval universities as an integral part of the quadrivium. Many prominent scholastic *doctores*, including Albert the Great, Roger Bacon, and Pierre d'Ailly, devoted much attention to astrology and alchemy aiming to investigate the hidden structures of divine design. Finally, occult knowledge quickly became indivisible from medicine, which, following the ancient idea, tied a bodily microcosm together with and a celestial macrocosm. This synthesis of the fields reflected, for example, in medieval art and is best illustrated by the famous miniature of the anatomical zodiac man from the *Très Riches Heures du Duc de Berry* (1412–1416, Limbourg brothers, now in Musée Condé, Chantilly, France) (Bober 1948). Occult disciplines were at times opposed, but these

attacks did not manage to challenge their popularity and status as of appropriate knowledge.

Renaissance responses to causality largely drew from the previous tradition and took the aforementioned features of the debate into account. What follows will demonstrate how Renaissance scholars developed, transformed, and questioned the existing approaches.

Innovative and Original Aspects

Renaissance reflections on individual fate and human freedom concentrated on two main points. The first one was indebted to Stoicism, which received its second life in the fifteenth century onward (Kraye 2016). Standing on the shoulders of giants, Petrarch, Coluccio Salutati (Salutati 1985), and those who follow them, sometimes called “Neostoics,” aimed to Christianize the Stoic notion of fate further. Their argument was twofold. Thus, on a level of a personal *fortuna*, they insisted that, as a divine gift, an individual’s free will had no limitations. Refusing to admit fatalism, they at the same time supposed that divine providence, which did not come into conflict with free will, might favor the virtuous. The idea to adjust Stoicism to the needs of Christian teaching gained its momentum in the sixteenth century and culminated in Justus Lipsius’ *De Constantia* (1584) (Lipsius 2016). Composed in a turbulent time of religious controversies in Western Europe, the treatise outlines the ways in which a Christian could rely on a Stoic understanding of constancy to withstand the evils of this world. Justus claims that resisting numerous temptations accompanying one’s everyday physical and intellectual life could eventually bring them consolation.

On the other hand, on a sociopolitical level, Renaissance scholars explored an alleged correlation between political virtues of an individual ruler or the institution of a specific political regime and events occurring under their reign (Hankins 2019). Most evidently, this problem declared itself in the accounts that dealt with the origin of natural disasters and, therefore, combined contemporary natural philosophical debates on the matter with political ethics (Manetti 2012).

In most cases, Renaissance thinkers sought to sit on two chairs at once: suggesting that negative manifestations of divine providence might indicate the need for a change, in the meantime, they acknowledged that the events could be of a fortuitous character, as they often occurred under the reign of good and virtuous rulers. This inconsistency demonstrates that for several fifteenth- and sixteenth-century intellectuals, the issue in hand presented a dilemma. It comes as no surprise that in pursuit of responding to it, they came up with new solutions to causality. Probably, the most significant among those was Machiavelli’s, who stressed the direct relationship between the body politic and the body of nature and within his political theory tied together three central concepts: the body politic, the notions of political fate and fortune, and the study of nature and, mainly, anatomy (Gaille 2018). In doing so, he extended the microcosm/macrocosm principle to political theory. Following Machiavelli, the sixteenth and seventeenth centuries saw an avalanche of texts that perceived various natural events through the body politic.

The second instance that embraced the notion of causality in the Renaissance was astrology. With the Aristotelian framework legitimizing astrology still in force, its credibility was substantially reinforced in the fifteenth century due to the revival of Neoplatonism and Hermeticism. Marsilio Ficino, the first translator of the entire Platonic corpus, the *Corpus Hermeticum*, Plotinus’ *Enneads*, and Iamblichus’ *De Mysteriis Aegyptiorum* into Latin, was responsible for enlarging the astrological discourse with new sources. He ascribed the previously unknown knowledge to the *prisca theologia* tradition, which stated there existed a single wisdom transmitted over times through various ancient theologians, spreading from Egypt and Persia to Greece and Rome. Ficino insisted that most *prisca theologi*, including the most significant one, Plato, had been rediscovered by Christians, after not being properly understood during their lifetimes and wholly forgotten after their death. His intention was to revive the legacy of *prisca theologi* and supplement it with Christian teaching. Given that most of these texts abound in magical and astrological elements, it opened

the door for magical speculation in Ficino's and his contemporaries' thought. Thus, when exploring celestial influences upon the terrestrial world, Ficino generally combined traditional medieval astrological texts with new, mainly Neoplatonic, ideas. This novel reading of astrology formed the basis for late fifteenth-century disputes on the status of astrology in both Ficino's own writings and that of his entourage. The third book of Ficino's famous *De vita libri tres* (1489) (Ficino 1998) exemplifies this trend.

Originally designed as a commentary to a chapter of Plotinus' *Enneads*, the *De vita coelitus comparanda* was a *credo* of Ficino's astrological medicine. According to him, a *magus*, who had correctly mastered the teachings of natural magic, astrology, and occult *prisci theologi*, could manipulate material objects in order to draw down the benefit of higher cosmic and immaterial forces and, consequently, use them to cure both a patient's soul and body. Ficino established an influential theory of the all-pervading "World Spirit" (*spiritus mundi*), which united the macrocosmic and microcosmic structures. From this perspective, the universe was conceived as a living being, with Ficino particularly emphasizing the correspondence and harmony between heaven and earth. What is important to note that Ficino's interpretation gave the green light to sixteenth-century Neoplatonized readings of ancient medicine, mainly of Hippocrates and Galen. Jean Fernel, Girolamo Cardano, and Cornelius Gemma all unanimously agreed that a physician's main task was to restore the balance in one's soul to cure their physical illnesses (Hirai 2011). It remained the dominant position on what epistemologically constituted medical knowledge, regardless of Vesalius' groundbreaking *De humani corporis fabrica libri septem* (1543), which was believed to address human internal and physical functioning only and did not touch upon the philosophical dimension of disease.

In the course of the early modern period, astrology as a theoretical discipline went through similar developments. Thus, in his last treatise, the *Disputationes adversus astrologiam divinatricem* (1496), Giovanni Pico della

Mirandola harshly attacked astrology on the basis of three arguments (Pico della Mirandola 2004). Firstly, he believed that astrology had embroiled in numerous discrepancies within the tradition caused by outdated mathematical calculations. Secondly, Pico meticulously reconstructed the astrological appropriation of Aristotle's philosophy and concluded that astrology was in fact in conflict with Aristotle's teaching on nature. Thirdly, astrology fundamentally contradicted Christian dogmas on free will. However, the elaborate critique did not lead to a complete rejection of astrology, in part due to fact that the authenticity of the treatise has been disputed since its publication; nor did the status quo change after the 1543 publication of Nicolaus Copernicus' *De revolutionibus orbium coelestium*, which in principle made the foundations of astrological speculation obsolete. Instead, sixteenth- and seventeenth-century scholars attempted to reform astrology in light of Pico's *Disputationes* and adapt the discipline to contemporary cosmological discoveries (Vanden Broecke 2003; Westman 2011). For instance, that was the case of Johannes Kepler's *Harmonices Mundi* (1619), in which with the use of geometrical methods the renowned astronomer justified the harmonious structure of the universe, including harmonic configurations in astrology and harmonic proportions in the music of the spheres. Cosmic music still debated in as late as the early eighteenth century was indeed another revealing example of how the at-first-glance outdated cosmological framework outlived multiple attacks. Only in the eighteenth century, in the wake of the Enlightenment, did astrology eventually lose its credibility and become marginalized.

The last fortress of the traditional framework, the harmonious design of the natural order, was under major scrutiny starting from the second half of the fifteenth century. Without necessarily casting doubts on divine involvement in human affairs, what competing theories did challenge was the Aristotelian notion of four causes, which, as mentioned above, had been integrated into Christian teaching since the Middle Ages. Neoplatonism provided a first reliable alternative to Aristotelianism and remarkably shook its

foundations. Despite all the attempts by pro-Aristotelian scholars to modify the system from within, the concerns about its possibility to operate adequately in a shifting world of Renaissance philosophy and science increased. One of the most fervent attacks on Aristotelianism was conducted by Bernardino Telesio in his foundational *De Rerum Natura Iuxta Propria Principia* (first edition – 1565; expanded edition – 1586) (Telesio 2009). Telesio proposed his own natural philosophical system in which he replaced the Aristotelian principles of matter and form with passive matter and active force the latter of which is twofold – heat and cold. Assuming that God had created two opposite primary globes, the cold Earth and the Sun considered the seat of heat, Telesio went on to claim that all natural things resulted from the confrontation of the two forces and were different depending on the amount of heat and cold they had. Abolishing the main categories of the Aristotelian philosophy, namely, the motion of the sky, the two principles of matter and form, and the prime mover, Telesio concluded that all natural things act only in accordance with their own nature and are not created and influenced by any external element. This also applies to the primary forces. To recognize their nature caused either by cold or heat, the forces, as well as all other natural things, have senses of perception. According to Telesio who firmly rejected the traditional interpretation of the subject in question, sense organs are nothing but organs and are not responsible for any sense perception. Telesio provided a more naturalistic and “neuroscientific” explanation of the phenomenon by claiming that sense perception is a sensation of sensing (*sensus sensus*), which takes place in the brain. He argues that human brain receives impulses from the external world and thus determines one’s sensory perception. This leads Telesio to the conclusion that empiricism based on sense perception is the only way to cognize nature. Telesio’s work was extremely influential at the time. His severe criticism of Aristotle, revolutionary aspects of his natural philosophy, and the theory of knowledge were widely recognized by Telesio’s contemporaries. Thus, paying tribute to Telesio’s *opus magnum*, Francis Bacon called him “the first of the moderns,” while Francesco Patrizi da Cherso, another ardent

critic of Aristotelianism, considered Telesio to be his mentor.

The revival of Skepticism and Epicureanism was another turning point in reconsidering the existing approach to nature and universal causality. Unlike their ancient predecessors, Renaissance skeptics did not deny the very possibility to acquire knowledge; instead, they adopted the writings of Sextus Empiricus to advance moderate forms of skepticism and to argue that only faith and religion, not reason and philosophy, could lead to truth and salvation. In the meantime, while attacking radical skepticism, Renaissance scholars admitted that although philosophical and scientific generalizations were often inaccurate, people were able to comprehend certain truths through cognitive faculties, experience, and senses. In the long run, this opened the door wide for the empiricist turn in early modern philosophy and science (Popkin 2003). The rediscovery of Lucretius’ *De rerum natura* in 1417 and the rise of Epicureanism revealed another danger for the integrity of the traditional Aristotelian framework and its vision of causality. Seen as an alternative to Aristotelian physics, no more capable of explaining new scientific discoveries, atomism appeared to be in the avant-garde of early modern thought by offering a valuable physical system based on a corpuscular theory of matter (Lüthy et al. 2001). With Galileo, who applied it in his famous experiment with falling bodies, Descartes, and Gassendi embracing the atomic theory, the Aristotelian causal interpretation and the notions of impetus and efficient cause became anachronistic. This, in turn, put on hold the long-standing belief that a divinely structured universe and an entirety of events in the physical world are strictly interlinked.

Cavalcanti, Bartolomeo

Born: Florence, 1503

Died: Padua, 1562

Véronique Montagne

CNRS, BCL, UMR 7320, 98 Bd Edouard Herriot, Université Nice Sophia Antipolis, Nice, France

Abstract

Bartolomeo Cavalcanti was a Florentine nobleman, diplomat, translator, and orator and was an opponent of the Medici.

Biography

Bartolomeo Cavalcanti helped defend Florence during the siege of 1530, when the Spanish-Imperial army surrounded the city, overthrew the Florentine Republic, and placed it under the rule of Alessandro de' Medici, Duke of Tuscany. After the assassination of the Duke in 1537, Cavalcanti voluntarily left Florence and went into exile, entering the service of Ercole II d'Este. In 1548, he went to Rome, first in the service of Paul III (Alessandro Farnese) and then Ottavio Farnese, grandson of Paul III. Within the walls of Siena, he fought Francis I de' Medici, grandson and successor of Cosimo I.

Works

Bartolomeo Cavalcanti wrote a number of works, including *La retorica divisa in sette libri con le postille di Pio Portinatino*, published in Venice in 1558 by Giolito de' Ferrari. From 1559 onward, the book was published under the title *La retorica di m. Bartolomeo Cavalcanti, gentil'huomo fiorentino*. [...] *Con le postille di m. Pio Portinaio giureconsulto, che dimostrano sommariamente tutto quello, che vi si tratta*. The text was quite a success: besides this edition, published in 1559 by Giolito de' Ferrari, there were also the 1559 (Pisa: B. Cesano), 1560 (Venice: G. de' Ferrari), 1564 (Pesaro: B. Cesano), 1569 (Venice: B. Robini), 1578 (Venice: C. Franceschini), and 1585 (Venice: Zoppini fratelli) editions. *La retorica* provides a complete rhetoric, taking into account *inventio*, *dispositio*, *elocution*, *actio*, and *memoria*. Cavalcanti's rhetoric incorporates the ideas of Aristotle, as well as Cicero, Quintilian, Hermogenes of Tarsus, Demetrius of Phalerum, Themistius, and George of Trebizond.

Cavalcanti translated Polybius and also wrote speeches to the Florentine militia (1529), a critique of Sperone Speroni's tragedy *Canace* (1550), and an essay on the different types of republics.

Abstract

Margaret Cavendish was a philosopher and writer active in mid-seventeenth century England. She is important not just as one of the first women active in philosophy in early modern age but as the expounder of an original scientific theory based on vitalism and materialism, by which she rejected the mechanical philosophy of Descartes and Hobbes and the experimental philosophy of Boyle and Hooke. Also, while not developing a theory of gender equality, she envisaged a form of emancipation of women based on intellectual activity as a

way to social recognition and to the exercise of influence on society and politics.

Alternate Names

[Duchess of Newcastle-upon-Tyne](#); [Lucas, Margaret](#)

Biography

Margaret Cavendish was born as Margaret Lucas in Colchester (Essex) in 1623. Her life was impacted by the English civil wars as early as 1642: being a member of a royalist family, her house was seized by parliamentary forces and she looked for the protection of the Queen consort Henrietta Maria, whom she followed in exile in Paris in 1644. The next year, she married the royalist exile William Cavendish, who hosted the “Newcastle Circle,” which was attended, among the others, by René Descartes, Thomas Hobbes, and Pierre Gassendi (Kargon 1966, 68–76). After having moved to Antwerp, in 1651 she temporarily came back to England to compound her family’s properties and started there her publishing activity in 1653 (Cavendish 1653). Being steadily back to England with her husband in 1660 (following the Restoration), she continued her writing and publishing from their manor in Newcastle, where she died in 1673. In the course of her life, she wrote a twenty-three volumes corpus covering diverse topics, from autobiography to natural philosophy and politics, and including literary pieces and novels. (Battigelli 1998, 1–5; Schiebinger 1999, 2–4).

An Independent Figure in the Age of Mechanical and Experimental Philosophy

As she did not attend university – as a consequence of the conditions of women at her time and of her temperament (Battigelli 1998, 7) – her participation to the Newcastle Circle did not bring her much contact with philosophers (Schiebinger

1999, 2). Margaret Cavendish was a self-educated thinker. Striving to develop her own philosophy, she engaged the main positions in natural philosophy at stake in mid-seventeenth century (Sarasohn 2010). Besides Aristotelianism, she criticized the expounders of “mechanical philosophy” and of “experimental philosophy” proposing her own synthesis (Cavendish 2001, x–xv, 7–10; Lewis 2001). As a main tenet in natural philosophy, she argued for the identity of “Matter, Self-motion and Self-knowledge” (Cavendish 2001, 137; Schiebinger 1999, 4–8). On this basis, she could propose a natural philosophical account alternative to Hobbes’ and Descartes’ and expounding a form of organicism or vitalism aligned with materialism (Hutton 1997; Cavendish 2001, xiv–xxxiii), capable to explain the stableness of nature itself (Cavendish 1996 [1668], 7; Michaelian 2009, 33–36), as well as its freedom (Detlefsen 2007), and requiring no active role of God on matter (Cavendish 1664a, 13–17; James 1999; Broad 2004, 46–49). Against Henry More’s and Jean Baptiste Van Helmont’s vitalism, on the other hand, she argued for the complete distinction of extension and spirit. The latter cannot be truly conceived by mind, which is material in itself (Cavendish 1664a, 526; Cuning 2006). Also, she criticized the expounders of the experimental philosophy, Robert Boyle and Robert Hooke, as for Cavendish philosophy is to be grounded on reason rather than on senses, insofar as reason is more reliable than empirical evidences and can ascertain the regularity of nature (Cavendish 1996 [1668], 56; Hutton 1997, 422–423; Schiebinger 1999, 4–8).

Naturalism and Feminism

As to her views in moral philosophy and politics, these entail a natural philosophical normative ideal: the highest ends to be pursued in life and society are stability and peace, just as nature tends to the same aims (Cavendish 1664b, 389–391, 2001, 128; Boyle 2006, 253–259). In turn, self-preservation leads to the desire of recognition of the self by the others, as by writing itself (Boyle

2006, 262). Indeed, given the separation of natural and spiritual domains, no concept of afterlife can be used as a foundation of morality (Wright 2014). Also her views on the condition of women bear witness of this normative ideal, as chastity is regarded by Cavendish as the highest virtue for women, since it preserves peace and stability in society. Women, however, may find the way to political power by exercising influence on men and by their intellectual achievements (Cavendish 1664b, 27, Cavendish 2003b, I; Boyle 2006, 276). In politics, such normative ideal is reflected by her royalism and the rejection of social contracts as the foundation of the absolute sovereignty of the King, since democracy would lead to chaos (Cavendish 2003a, 276–278; Boyle 2006, 282–283). Though considered as part of nature, for Cavendish all political bodies act as a republic (Walters 2014, 159).

Tübingen, Germany

Abstract

The entry deals with Konrad Celtes, known as the German “Arch-Humanist” (“Erzhumanist”), one of the most influential authors and scholars in pre-Reformation Germany.

Alternate Names

Bickel, Konrad; Pickel, Konrad; Protucius, Conradus

Biography

Originating from a family of winegrowers near Schweinfurt (Lower Franconia), K.C. studies in Cologne, Heidelberg, and Leipzig where his first publication – a textbook on prosody and metrics (*Ars versificandi et carminum*, 1486) – appears. In Leipzig, he becomes a protégé of Frederick the wise, elector of Saxony. On April 18, 1487, he is crowned by Emperor Frederick III as *poeta laureatus* at the Nuremberg castle. Soon afterward, he sets out for a journey to Italy. In Bologna, he meets Filippo Beroaldo, editor of Apuleius and Neo-Latin poet, in Florence Ficino and his circle, and in Rome Pomponio Leto and the Roman Academy. Via Budapest C. reaches Krakow in 1489 where he meets Philippus Callimachus (Buonaccorsi) and Laurentius Corvinus. After a stay in Prague, he is appointed professor of rhetorics and poetics in Ingolstadt where he delivers his famous inaugural speech in praise of the *studia humanitatis* (Gruber 2003). In these

years, he is closely connected to the Nuremberg humanist circle around Sebald Schreyer and Hartmann Schedel becoming the primary inspiration for the young Albrecht Dürer who cuts the famous *Philosophia*-woodcut for C.’ *Amorum libri quatuor* (1502; on Celtes and Dürer cf. Robert 2012; Schauerte 2015). In 1497, C. is invited to Vienna by the young emperor Maximilian I who appoints him as director of the *collegium poetarum et mathematicorum* in Vienna (formally inaugurated on 1 February 1502). In return, C. dedicates to Maximilian his *magnum opus*, a volume with illustrations by Dürer containing among others the *Amorum libri quatuor*, the *Norimberga*, and the *Germania generalis* (1502; Robert 2003). C. spends his last years in Vienna and Augsburg where he keeps close contact to Konrad Peutinger. He dies on 24 January 1508. His original gravestone is located inside St. Stephen in Vienna. Shortly after his death, Dürer attributes Celtes a place at his own side in his painting *Martyrdom of the ten thousand Christians* (1508).

Heritage and Rupture of Tradition

In pre-Reformation Germany, C. represents a new type of humanist intellectual deeply influenced by Italian Renaissance thought, literature, and “self-fashioning.” In contrast to Italian Quattrocento poets like Sannazaro or Poliziano, C. writes exclusively in Latin. His main works – *Odorum libri quatuor* (ed. 1513), *Epigrammatum libri* (ed. 1886), and *Amorum libri quatuor* (1502) – are milestones of a brand new and formerly unknown secular poetry which gives a wide space to religious criticism and erotic frankness. C. provides his *Amores* with a highly ambitious philosophical program: its four books follow a tetradic structure showing the protagonist in different places and cities, in different ages and “humors” with different concubines (Robert 2003). Love elegy thus becomes a medium of topography, history, and platonic philosophy (cf. the *Philosophia*-woodcut, executed by Dürer).

Innovative and Original Aspects

C. stands at the beginning of German “Landeskunde” (*descriptio Germaniae*) comprising philology, archeology, and geography. Driven by a patriotic impulse based on the reception of Tacitus’ *Germania* which C. edited in the 1490s and which he supplemented by his *Germania generalis* (Müller 2001), C. tracked and promulgated systematically “ancient” German poetry like the *Comoediae* of Hrotsvit of Gandersheim (ed. 1501) or the *Ligurinus* of Gunther of Pairis (Robert 2009, 382–385). Another highly important aspect represents C.’s networking strategies: in the course of his *peregrinatio*, C. sets up a series of friendships and academic societies (*Sodalitates*) all over Germany which are reflected in his *Codex epistolaris*.

Impact and Legacy

C.’s immediate impact on the evolution of German humanism was deep. He opens a rich production of sixteenth-century Neo-Latin poetry in Germany (Kühlmann et al. 1997). Whereas C. is well remembered as founder of the *studia humanitatis* in Germany, the impact of his poetry diminishes and finally vanishes after the Reformation. Nevertheless, all his scientific ideas, especially the *Germania illustrata* and the search for the remains of ancient German poetry (“deutsche Altertümer”), are taken over by his immediate disciples and friends like Aventinus and Vadianus and by following generations of German poets like Martin Opitz or Johann Christoph Gottsched.

Censorship in the Renaissance

Grantley McDonald

Faculty of Music, University of Oxford, Oxford, UK

Institut für Musikwissenschaft, Universität Wien, Vienna, Austria

Abstract

During the Middle Ages and Renaissance, Western attitudes to censorship were determined principally by Christianity, the hegemonic religious and political discourse in Europe. While the religions of the Hellenistic and Roman world, within which Christianity was born and developed, were concerned for the proper performance of religious ritual, the earliest documents of Christianity – like those

of Judaism, from which it sprang – were even more deeply motivated by a concern to identify, articulate, and maintain correct beliefs (“orthodoxy”). Accordingly, Christian censorship represents an attempt to control both inward beliefs and their outward expression. The word “censorship” can refer to customs or laws that prohibit the expression of certain opinions, to the legal processes through which conformity to such norms is achieved (whether before or after publication), or to the punishments imposed on those who refuse to conform. It is essentially an imposition of authority for the purpose of creating agreement or silencing dissent.

This entry first explores medieval mechanisms of censorship and then describes the new institutions and practices of censorship developed in response to the invention of printing and the Protestant Reformation. Finally, it briefly describes some important medieval and Renaissance thinkers and writers whose work was subject to ecclesiastical or state censorship.

Heritage and Rupture with the Tradition

The Hebrew Bible and the Christian Scriptures contain commandments intended to guide the life of the individual and his or her relationship to God and the community. Censorship attempts to enforce these commandments by removing what might offend them. The biblical commandments include injunctions to purity of thought, action, and speech. The Bible contains stories that describe punishments suffered by those who failed to keep these rules and even an explicit reference to the burning of books that offended against the divine prohibition of magic (Acts 19:19). On the basis of statements in the Christian Scriptures, the church claimed the right to punish or forgive wrongs (Matthew 16:19). The selection of the Christian canon of Scripture is perhaps the church’s earliest, and arguably most significant, act of censorship. The desire of the early church to

guide believers toward orthodox writings and away from heresy is fully expressed in the *Decretum Gelasianum* (sixth century), which contains lists of approved and proscribed authors.

The practice of censorship is intimately associated with the notion of heresy. The Greek word *hairesis* (“choice”), from which the word “heresy” is derived, originally designated a philosophical or religious sect, or a decision to follow one particular variety among the spectrum of beliefs present in early Christianity. Once the “orthodox party” (and the writings it considered canonical) had established its dominance, the notion of “heresy” came to signify dissent from majority belief and practice, deviations which the church attempted to extirpate in the interests of maintaining the unity of its dominant position. By definition, heresy is a relative term, used to characterize a position held by an opponent; nobody fights to hold an opinion he or she believes incorrect.

There was a relatively high degree of doctrinal agreement in the Western European church during the Middle Ages, due in part to the church’s virtual monopoly on education and learning, and to internal structures of doctrinal review. Authors routinely submitted their writings to the judgment of their fellows, and formally subjugated their own judgments – whether sincerely or not – to the ultimate arbitration of the church. When medieval writers or orators did advocate dissent, those who condemned them often resorted to the patristic diatribes against heresies for their language, imagery, and accusations. This can lend late medieval and early modern writings against heresy a curiously antiquarian feel, as apologists sought to equate new forms of dissent with earlier ones.

Religious dissent in the Middle Ages was generally of three kinds. The first comprised learned dissent over doctrine or conduct, generally within the context of religious communities. The second kind attempted to disrupt the temporal order of the church; such attempts often began as zealous reform movements within the church that were expelled once their protagonists refused to capitulate to the ecclesiastical hierarchy. Third were popular heretical movements such as

Catharism, drawing support largely outside the church. Some movements of dissent, such as Lollardy or Hussitism (see below), might contain elements of all three kinds. The medieval church had few mechanisms to deal with large-scale dissent until the rise of the Inquisition. The medieval Inquisition was not yet a centrally organized body; rather, it was a method of legal examination enjoined on itinerant inquisitors – usually members of the mendicant orders – to stem the spread of heresies such as Catharism. Usually, the church had to rely on the cooperation of the secular authorities to execute heretics it had condemned. In the papal bull *Sicut universitatis conditor* (1198), Innocent III likened the relationship between church and state to that between sun and moon, respectively: while both are necessary and glorious, the moon's light is derived from that of the sun. In the bull *Ad extirpanda* (1252), Innocent IV empowered inquisitors to use limited torture to compel heretics to confess or name their associates, and authorized the secular arm to execute those condemned. When relations between church and state were harmonious, both could move decisively against heretics. When the secular authorities withdrew their co-operation, the church might be powerless to enforce its will to control dissent. The establishment of universities under princely patronage in the late Middle Ages could create environments in which ideas disruptive to the church's power could flourish under secular protection. Dysfunctional relationships between the church and princely powers contributed to the rise and entrenchment of several uncontrollable movements of dissent, notably Hussitism and Lutheranism.

The medieval church distinguished various kinds of control. A *prohibitio* does not make any judgment on the truth of a proposition, but merely proscribes its expression within a determined place and time. A *condemnatio* prohibits the expression of ideas which are generally – though not always – implied to be erroneous. In medieval usage, *censura* refers to the imposition of disciplinary action – excommunication, interdict, or suspension – by an ecclesiastical judge. Modern conceptions of censorship are thus closer to the

medieval notions of *prohibitio* and *condemnatio* than to *censura*. In the late thirteenth century, an anonymous author compiled an account of approximately thirteen cases of errors condemned by the University of Paris (and one in England, the condemnation of Archbishop Robert Kilwardby by the University of Oxford in 1277). From these and similar cases, it is clear that medieval scholars considered censorship as part of the exercise of teaching authority rather than as a shackle on free expression (Thijssen 1998).

The church possessed various means to enforce censorship. It could try to suppress suspect texts or limit their spread to the laity. Such practices could lead to self-censorship, in which authors declined to voice ideas likely to attract official opprobrium; to an author's ostensible disavowal of his real opinions as mere hypotheses or probabilities; or to the deliberate use of an obscure or esoteric manner of expression, in which the author's real position was hidden from the uninitiated. In the age of print, the economic mechanism of market censorship forced printers and publishers to weigh the projected profit from the sale of desirable suppressed literature against the potential penalties if caught.

Several developments in the intellectual life of the later Middle Ages increased the incidence of dissent. One was the trajectory of Christian philosophy. For example, the French philosopher Roscelin (c. 1050–c. 1124) was led by his commitment to nominalism to reject the ontological notion of wholes, and with it the traditional notion of the Trinity as a single whole, a notion deplored by many contemporaries. The translation of philosophical works (both ancient and recent) from Arabic into Latin introduced Western readers to ideas that challenged the theological consensus. Aristotle's ideas on the eternity of the world or human virtue were difficult to square with Christianity, and many of his ideas were initially condemned by the University of Paris. However, when Thomas Aquinas used Aristotle's ideas to explore Christian doctrines such as transubstantiation, the Stagirite's ideas assumed a unique authority in Christian philosophy that would last well into the seventeenth century.

Innovative and Original Aspects: The Effect of Print on Censorship

Increased lay literacy, especially in densely populated regions such as the Rhineland and the Low Countries, posed a potential threat to doctrinal unity. The invention of printing from moveable type in the middle of the fifteenth century augmented this danger by rapidly increasing the availability of reading material, and by creating a medium through which controversial issues in religion and politics could be discussed more openly in the public sphere (Infelise 1999). In the bull *Inter multiplices nostrae sollicitudinis curas* (1487), Pope Innocent VIII predicted the potentially disruptive power of the printing press, and commanded that printers were to submit all works to ecclesiastical review before printing, under pain of excommunication and fines. Alexander VI confirmed this bull in 1501.

Such texts routinely protested their benign intention: the authorities simply wished to shield believers from the moral and doctrinal error bound to result from reading heretical literature. The desire to censor impinged on all kinds of writings that affected the inner life of the Christian, including religious beliefs and moral sentiments. Censorship thus covered not only potentially dangerous doctrinal writings but also literature deemed obscene or otherwise morally corrosive (Helm 2014). Sometimes censors wished to restrict access to writings which were good in themselves but which could become harmful in the hands of the unlearned. The popular Strasbourg preacher Geiler von Keysersberg maintained that placing German bibles in the hands of the laity was like giving a child a knife to cut its bread. Such attitudes were certainly paternalistic, but modern theories of censorship in democratic countries – especially those intended to restrict the availability of sensitive material on the Internet – are hardly less so.

Delegates to the Fifth Lateran Council (1512–1517) discussed ways to control dangerous recent developments in education and culture. In the bull *Apostolici regiminis* (1513), Leo X sought to balance the study of ancient pagan literature against a renewed commitment to the study of

theology and canon law. This council declared that some recent thinkers, by accepting the notion that the domains of theology and philosophy were separate (the theory of “double truth”), had erred by following Muslim exponents of Aristotle, such as Averroës, in asserting the heretical position that the human soul is not immortal.

In the bull *Inter sollicitudines* (1515), Pope Leo X – possibly inspired by reforms suggested by the Camaldulensian monks Pietro Querini and Paolo Giustinian – commanded that all books should be censored before publication. The document declared that while printing was a great benefit which made texts easily available even to the poor, it potentially exposed believers to harmful literature. Emphasizing the role of education as the wellspring of reform, the bull declared that students should be exposed to the best of ancient literature but protected from modern imitators who confused paganism and Christianity. Translations of foreign works that contradicted the Catholic faith were deemed suspect. Henceforth, all publications, whether in Latin or the vernaculars, were to be submitted to a bishop, the Master of the Sacred Palace (the papal theologian), or their vicars for pre-publication approval. However, many authors, including Erasmus, remained unsure where they were supposed to send their works for official inspection.

Since the Master of the Sacred Palace was always a Dominican, this command implied that the Roman Inquisition, dominated by the Dominicans, would be involved in this process. In the decades around 1500, several inquisitorial bodies were instituted to renew or replace the medieval Inquisition, an institution founded in the thirteenth century to deal with popular heretical dissent. In 1478, the Catholic Monarchs Isabella I of Castile and Ferdinand II of Aragon instituted the Spanish Inquisition to investigate the sincerity of Jewish and Muslim conversions to Christianity. The Roman Inquisition was founded in 1542 to extirpate the threat of Protestant heresy.

With its “Rubric on teachers, heretics, and those who cause scandal to the faith of Christ” (*Rubrica de magistris, deque haereticis & Christi fidem scandalizantibus*), the Provincial Council of Florence (1517–1518) acted to limit the teaching

of classical languages from the work of authors deemed either obscene, such as Catullus or Martial, or philosophically suspect, such as Lucretius, who denied the immortality of the soul. This rubric also proscribed mockery of the church. Disobedience was to be punished with fines, imprisonment, or even excommunication.

The Protestant Reformation as Catalyst to Further Procedures of Censorship

The Western church was governed by the conviction that continual internal reformation was necessary for its ongoing health. Numerous reform movements grew up during the Middle Ages, sometimes at the instigation of the papacy, but more often driven by individual clerical reformers motivated to remove clerical abuse or return religious orders to their original simplicity. Some reform orders, such as the Cistercians, Franciscans, and Dominicans, became established within the bosom of the church. However, this ostensible unity also masked tensions: within the Franciscan order, some demanded ever stricter renunciation of property and wealth and wished to impose this standard on the rest of the church. The disciplinary mechanisms of the medieval church could usually deal with such internal dissent relatively effectively. However, complications could arise when the claims of those the church condemned as heretics were supported by secular powers, as was the case with John Wyclif and Jan Hus (see below).

Martin Luther's protest began with his objections to the practice of selling indulgences, documents remitting the temporal penalties due to the church as propitiation for sin. Luther realized that the aggressive sale of indulgences to raise money for the building of the new St. Peter's in Rome led ill-informed laypeople to imagine that they were purchasing salvation. This snowballed into a wider critique of abuses within the church and an attack on the legitimacy of papal claims to power. Luther's complaints were thus to a degree comparable to medieval reform movements. However, his rapid mobilization of the press to win over secular powers, educated urban elites,

and discontented rural hierarchies placed his protest in an entirely different order. Initial attempts to silence Luther or force him to recant failed. In June 1520, Pope Leo X issued a bill, *Exsurge domine*, in which he threatened Luther with excommunication and called for the burning of his books. Luther responded by burning the bull. Emperor Charles V ratified the bull in October 1520, and Lutheran books were burned, sometimes in the emperor's presence, at Leuven, Liège, and Cologne (Kronenberg 1948; Soen et al. 2017). Following Luther's excommunication in January 1521, Charles issued further decrees for the destruction of Luther's works, which were described as promoting the heresies of Hus, previously condemned by the church. Charles also had lists of prohibited authors and works printed on placards. Charles's edicts encouraged individuals to denounce neighbors who owned Lutheran books with the promise of a third of the fines levied as a result of their information.

In April 1521, Luther was summoned to the imperial diet at Worms. Here again he refused to retract his opinions, which he defended as consistent with Scripture, the highest arbiter of doctrine and morals. After his sudden departure from the diet, the emperor issued an edict on 8 May 1521 which commanded the seizure and destruction of Luther's books. This Edict of Worms became the legal basis for subsequent imperial censorship of heretical literature. Failure to comply was equated with *lèse-majesté*, which bore a potential sentence of execution.

The burning of books was both a practical means to eradicate dissenting literature and a symbolic measure to purify the community from its contagion. When the writings of Peter Abelard on the Trinity were condemned as heretical, he was forced to burn them personally. In 1248, cartloads of Talmuds were burned at Paris as an affront to Christianity. In the decades around 1500, Jewish and Muslim books were burned in Spain. Jewish books were burned at Venice in 1553 and 1568. In 1495, the Dominican preacher Girolamo Savonarola (1452–1498) encouraged his hearers to purify Florence by burning books by Ovid, Propertius, Dante, and Boccaccio. However, the

practical efficacy of burning books as a means for eradicating their content was diminished by the proliferation of printed copies.

Rulers commissioned the universities in their territories to examine books for suspect material. Most important were the theological faculties of Cologne, Leuven, and Paris; the latter two would subsequently draw up lists that were formalized as Indices of Forbidden books. Sometimes the initiative came from bishops, such as Johannes Fabri, coadjutor bishop of Wiener Neustadt, who issued a proto-Index of Forbidden Books in 1528. The most important target of such examinations was heretical literature, including vernacular translations of bibles containing commentaries or glosses considered inimical to the Roman church. A secondary target was obscene literature, though censors sometimes declined to name such titles explicitly, lest they should draw attention to them.

The Index

In 1542, with the bull *Licet ab initio*, Pope Paul III established a body that would henceforth become intimately involved in the regulation of heresy: the “Sacred Congregation of the Roman and Universal Inquisition” (*Sancta Congregatio Romanae et universalis Inquisitionis*), often simply abbreviated as the “Holy Office” (*Sacrum Officium*) (see Wolf 2006). The Holy Office was empowered to pronounce on erroneous beliefs including sorcery, magic, and astrology; sexual crimes, such as polygamy or solicitation during confession; pretended holiness; veneration of non-authorized saints; simony; unauthorized assumption of authority; and abuse of the sacraments. This body was to act as court of last instance for all lower religious tribunals. It was constituted by 6 (later 12) cardinals, coordinated by a Dominican; its decisions were made in the presence of the pope. The establishment of the Holy Office marked the beginning of a concerted effort on the part of the church to control printed books.

The first Italian Indices of Forbidden Books were drawn up at Lucca in 1545, perhaps at the

insistence of the Inquisition, and at Venice in 1549, at the request of the papal legate Giovanni della Casa. The Venetian list included three classes of books: those of authors whose works were banned *tout court*; individual works; and anonymous works. The delay in producing such lists – even if provisional lists had been promulgated by secular powers since the 1520s – may be explained by the fact that their publication was likely to damage ongoing attempts to reconcile Protestants to the Catholic Church. Only once reconciliation had become hopeless – as acknowledged in the bull *Licet ab initio* – did the Catholic Church take serious measures to shield its members from harmful contact with heretical literature.

In 1571, Pope Pius V established the Congregation of the Index, an offshoot of the Holy Office, to strengthen the church’s power over the burgeoning book industry. This body had the specialized task of assessing printed books post-publication, drawing up lists of forbidden works, and publishing updates every few decades. Printers were obliged to send a copy of every title to the Congregation for inspection. The Congregation examined not only religious literature but also medical, legal, scientific, and creative literature. Books were sent to the Congregation by authorized agencies, such as papal nunciatures, superiors of religious orders, or bishops. The secretary of the Congregation made an initial decision whether the work was worth further investigation. If so, he commissioned *consultatores* (expert members) or external experts such as theologians or prelates to examine the work and submit written reports. On this basis, a book was either prohibited or acquitted, or the case was adjourned. In case of doubt, further opinions might be solicited. Once the pope had pronounced the final decision of the Congregation, a decree was posted at the doors of the major Roman churches and sent to nuncios abroad. These decrees were then compiled into the next edition of the Index, which appeared every few decades. In time, the Congregation was also used to block undesirable individuals, such as Jansenists, from advancement. Apart from censoring books, the Congregation was also authorized

to issue permits for individuals to read prohibited works. This body was finally abolished in 1966.

The first Roman Index, published even before the establishment of the Congregation, was drawn up under the instruction of Paul IV in 1557; however, this Index, which may have been intended simply as a working paper for the Holy Office, was never promulgated. A revised version, published in 1559, included about 550 authors, including Boccaccio, Rabelais, Aretino, Erasmus, and Machiavelli, whose works were condemned entirely or in part. It also contained blanket bans on all works on the occult, all anonymous works written by heretics, many editions of the Bible (including a universal ban on vernacular translations), and all books printed by any one of a list of 61 printers. (Some printers who resisted censorship of the press, such as Étienne Dolet, paid with their lives. Others evaded detection by omitting their names or using false printing addresses.) It is clear that most of these works had not been subjected to any detailed process of examination but were simply declared automatically erroneous through their authorship, even if they contained much material that was unobjectionable. Some complained that this Index limited free thought. The Grand Duke of Tuscany even threatened to fine any printer in his territory who published it.

The Council of Trent published another Index in 1564, which would form the basis of future Roman lists. It proscribed all works of heretics produced before 1515, as well as works by Protestant heresiarchs. (Books on nonreligious subjects by less prominent Protestants might be approved after inspection.) Since the Council of Trent had declared the Latin Vulgate as the only authoritative text of the Bible, the Tridentine Index banned unauthorized editions and translations of the Bible, though it allowed those explicitly licensed by an inquisitor or bishop to read such editions and translations. It required that biblical lexica and concordances should be examined and expurgated if necessary. It banned the laity from reading controversial vernacular literature treating religious questions on which Catholics and Protestants disputed. It clamped down on obscene literature and works on divination, magic, and the occult. A further revision in

1593 incorporated material from earlier local lists. It provided lists of passages in some works which, once deleted, would render such books innocuous. It also prescribed that books had to be submitted to inspection by the ecclesiastical authorities and supplied with the certification *Testatur* ("We declare"). Later, a more differentiated system was introduced: the certification *Imprimatur* ("may be printed") indicated that a bishop or his vicar general had given permission for the publication of a book dealing with faith or morals; *Nihil obstat* ("nothing should prevent") indicated that an ecclesiastical censor believed that the book contained nothing harmful to faith or morals; and the permission *Imprimi potest* ("can be printed") was given by the superior of a religious order to a work written by a member of the same order. Inspection and approval were to be carried out free of charge. The Indices banned not simply the publication of banned material but also its sale, trade, and possession. The 1664 Index included the work of many of the foundational thinkers of early modern thought, including Copernicus, Galileo, Bacon, Descartes, Hobbes, Pascal, and Spinoza. On the other hand, the Index had a positive side in that it required printers and publishers to conform to high standards of textual accuracy.

These measures were not uniformly popular, even in Catholic territories. The Venetian book industry, the largest on the Italian peninsula, supported by the government, initially resisted the church's attempts to regulate the trade. Indeed, the city government itself exercised a degree of censorship over politically sensitive or salacious books, even illustrated editions of Ovid. Together, the Venetian book industry and the city government defeated the Indices of 1549, 1554/1555, and 1559. However, several factors eventually won the printers of Venice over to the church's side. Many Venetian patricians were alarmed by fears that Protestantism was gaining support among the city's youth. Moreover, the Council of Trent raised hopes for realistic internal reform of the church. The increased numbers of religious publications arising as a result of the Council also promised to provide steady work for Venetian printers. By the 1560s, Venice had a system of

pre-publication censorship in place. The Inquisition was now granted power to inspect Venetian bookshops and consignments of imported books and to arrest those who dealt in prohibited literature. However, disputes over commercial issues, such as the right to publish the new Tridentine breviary and missal, led to renewed conflict between the church at the Venetian state. Although the Inquisition prevented Venetian printers from producing almost all titles on the Index from about the 1570s until the early 1590s, dealers within the city still trafficked in imports of illicit materials. From the 1590s onward, the Venetian state again began to assert its control over the book trade and over the ways in which its citizens expressed their religious convictions. Censorship in Venice became virtually restricted to control of political expression. Ironically, the imposition of the Interdict on Venice in 1606–1607 allowed for the virtually unfettered importation of prohibited publications, since the church had rendered itself powerless to take further action in the city. Even after the Interdict was lifted, book dealers in Venice frequently ignored the Index with impunity (Grendler 1977).

The Roman Catholic Church was not the sole agent to suppress the books – or bodies – of dissidents. Luther urged princes to put down the Peasants' War of 1524–1525, a political and ideological conflict, with deadly force. He condemned "Spirituals" and Anabaptists as subverters of society. He and his followers roundly condemned antitrinitarians. After Luther's death, "genuine Lutherans" persecuted the followers of his more moderate lieutenant Philipp Melancthon. Lutheran authorities sent out visitations to check whether local clergy taught in conformity with the established orthodoxy and encouraged local informants to provide information. Lutheran universities, such as those of Tübingen and Leipzig, exercised inspection and control over printed books. The evangelical city council of Basel passed decrees in 1524, 1531, and 1558 to outlaw unauthorized printing (and reprinting) and to encourage publishers to deposit copies of their books in the university library (a requirement made binding in 1558). The Geneva Consistory began censoring books in 1539; Calvin became

actively involved in 1542. Calvin also famously contributed to the condemnation and execution of Miguel Servet (Michael Servetus), although this famous case – condemned in the nineteenth century as a symptomatic expression of the repressive temper of Calvinism – was the only such action ever taken in Protestant Geneva.

A Variety of National Responses

Various European states responded to the need for controlling the book trade in different ways (Maclean 2012). The response of Charles V to the sudden explosion of heretical literature was closely linked to the policies of the papacy. While Protestant literature continued to circulate in the Low Countries in spite of legal penalties, Protestant literature made fewer inroads into Charles's Spanish territories. Most of the heretical books in Spain were printed abroad, for example, in France. In the 1550s, Fernando de Valdes, the Inquisitor General, became increasingly concerned by the presence of such literature in Spain and had the 1551 Leuven Index of Forbidden Books reprinted there. As part of a campaign to stanch the influence of Protestantism in the peninsula from 1558, Philip II passed laws restricting the importation of books from England, France, and Germany and required Spanish printers to apply for a royal privilege, which was to be printed in each book. When Philip instructed Benito Arias Montano, his scholarly envoy to the Low Countries, to prepare an edition of the Tridentine Index in 1570, Arias suggested an *Index expurgatorius*, which listed suspect passages in books that were otherwise orthodox. (This approach had already been suggested in an Index prepared at Leuven in 1550.) Once offending passages had been deleted, the books might be safely read. Arias' *Index expurgatorius* appeared at Antwerp in 1571 and would become a model for later Spanish practice. In 1583–1584, the Spanish Inquisitor General Gaspar de Quiroga published a two-volume index which proscribed the works of several philosophers and literary figures, including Abelard, William of Ockham, Dante,

Machiavelli, and Rabelais. However, booksellers complained of inconsistency and often ignored the lists.

The book trade in Paris was regulated well before the Reformation. Booksellers in Paris could apply for a license from the Sorbonne to acquire the status of “libraire juré” (sworn bookseller or stationer). Printers were required to use a distinct mark to identify their products, to employ competent correctors, and to supply deposit copies. In 1521, the University of Paris was granted the right to inspect religious books and to approve or condemn them; from 1544 onward, the university published lists of restricted books. Such measures were consistent with the efforts of François I both to promote erudition and to check the spread of evangelicalism in France. In 1540, Pierre Rebuffi wrote a treatise that regulated the French book trade by codifying many earlier customs and requirements. Royal edicts passed in 1539, 1551, and 1566 brought the French book trade even more firmly under state control, for example, by requiring that every book printed in France from 1566 should bear a royal privilege, which presupposed that it had been inspected and passed.

Within the German-speaking parts of the Holy Empire, the book trade came under tighter regulation from around 1567 with the establishment of the “imperial book commission” (*Kaiserliche Bücherkommission*) at the Frankfurt book fair. This provided a convenient point of contact between booksellers at one of the two largest fairs in Western Europe (the other being at Leipzig) and the imperial chancery in Vienna. The chancery regulated the trade of books through its own system of post-publication censorship while also offering authors and publishers the right to apply for legal protection through printing privileges, which threatened those who produced or distributed unauthorized reprints of protected materials with confiscation and fines. The commission obliged printers and publishers to produce catalogues. These catalogues thus served not merely a commercial role, drawing new works to the attention of potential purchasers; they also allowed the commissioners to ascertain whether a given publisher was offering potentially

problematic material for sale. From the end of the sixteenth century, the Catholic Church exercised an increasingly dominant role over the book commission. In 1597, the imperial chancery expanded the body’s activities by appointing a second commissioner. While the officers of the commission or the city council were initially empowered to demand to see a printer’s printing license or to inspect their stock for offensive material during the fairs, in 1601 the imperial book commissioner Valentin Leucht – himself a Catholic priest – acquired the right to inspect book shops in Frankfurt at any time. The commissioners were also responsible for collecting the obligatory sample copies from printers or publishers, which were sent to the court library in Vienna. When the Jesuits attempted to use the commission’s collection of multiple sample copies to bag copies for themselves, publishers resisted, complaining that the order simply wanted to stock its schools’ libraries for free.

In England in the 1520s, Henry VIII regulated printed materials strictly. He had the parliament ban evangelical literature in Latin or in English translation, as well as works that speculated on the royal succession. The first modern English New Testament was printed in Germany and smuggled into England. Although royal and ecclesiastical agents tried to use their influence abroad to stop the printing and seized imported copies where they could, their measures were only partly successful. In the meantime, printed French New Testaments circulated among evangelically inclined members of the English royal court. The first Act of Supremacy (1534) gave Henry VIII, as head of the church in England, the right to commission visitations, to repress religious dissent – which was now equated with sedition – and to reform the church as he saw fit. The Act of Six Articles (1539) threatened those found guilty of denying Catholic doctrines such as transubstantiation, clerical celibacy, or confession with the same penalties due to felons. Henry’s policy on the admissibility of English bibles was inconsistent and changing; while he had earlier persecuted and executed William Tyndale for publishing an English bible, he later commissioned a revision of Tyndale’s version, which

appeared with a title woodcut which displayed Henry lavishing the divine word on a grateful populace. During the reign of Henry's daughter Mary, the Stationers' Company was instituted to register and license all books printed in England. By the end of the sixteenth century, other individuals and bodies also licensed books: the bishop of London, the Archbishop of Canterbury, the Court of High Commission, and the Star Chamber. In Britain, censorship was used to control controversial theological literature, such as works of antitrinitarian theology, throughout the seventeenth century. In 1683, at a delicate moment for the Stuart dynasty, the convocation of the University of Oxford issued a decree *Against certain pernicious books and damnable doctrines destructive to the sacred persons of princes, their state of government, and all human society*. Under this decree, works by Milton, Richard Baxter, and Hobbes were to be burned. On the other hand, Bodley's librarians at Oxford in the 1620s used the Catholic Index as a guide for selecting works for purchase.

Censorship of Medieval and Renaissance Philosophers

The writings of several major philosophers and thinkers of the Middle Ages and Renaissance were censored. In many cases, this was due not simply to the content of their ideas but also to rivalries and enmities or to the philosophers' own tactlessness and political ineptitude (see Jones 1999 for further details of each of the philosophers treated here).

Peter Abelard (1079–1142) held that the doctrine of the Trinity could not be understood by reference to the Scriptures but primarily through human reason. Even if it is mistaken to consider Abelard an exclusive rationalist, several synods judged his position erroneous. He was forced to burn his books, to recite the Nicene Creed publicly, and to submit to a short term of imprisonment. Opposition to Abelard was certainly motivated by the many enemies he had made through his disdain of lesser intellects, as

well as by his seduction of the scholar Héloïse, a ward of Fulbert, a canon at Paris. Abelard's works were listed on the Roman Index of 1559 and the Tridentine Index of 1564 (see Bujanda et al. 1985–2002 for an analysis of each of the Indices).

The poet and political philosopher Dante Alighieri (1265–1321) lived in an Italy divided by two rival parties: the Guelphs, who favored papal supremacy, and the Ghibellines, who supported the political primacy of the Holy Roman Emperor. In his treatise *On Monarchy* (*De monarchia*), Dante criticized the papacy for its rapacity and argued that the emperor receives his power directly from God, not from the pope. Dante's treatise was burned in France in 1318, under the French pope John XXII, and later placed on the Roman Index of 1559 and the Tridentine Index of 1564.

In his radical work *Defender of the Peace* (*Defensor Pacis*), Marsilius of Padua (c. 1275–c. 1342) not only defended the radical Franciscan position that the church should not own property; he also denied that the clergy, even the pope, should become involved in temporal affairs. He held that society should only have one ultimate coercive power: the emperor, who could elect, censure, or remove popes at will. The only authority exercised by the church was doctrinal. This authority was exercised not by the popes but by councils of the church. John XXII condemned Marsilius' work. In the wake of the Protestant Reformation and the resulting splintering of political power, the church evidently felt that Dante's *Monarchy* and Marsilius' *Defender* were still dangerous texts and placed them on the Index.

The Oxford professor John Wyclif (c. 1330–1384) attacked abuse and corruption in the church and advocated that all Christians, whether clergy or laity, should study the Scriptures. In his treatise *On Civil Dominion* (*De civili dominio*, 1375–1376), he criticized clerical ownership of property, defended the primacy of the King of England over the English church (including his right to nominate or remove holders of benefices), and suggested that the kingdom of England would be justified in refusing to pay papal taxes. Human dominion is conferred solely

by divine grace; moreover, the property derived from this authority is to be shared with others. Nineteen propositions from Wyclif's work were condemned by Pope Gregory XI in 1377. In his treatise *On the Truth of Holy Scripture* (1377–1378), Wyclif conceived of the Bible as a divine emanation and thus true and free of error. Apparent contradictions or errors are therefore the result of the limits of human understanding. He also suggested that assent to his own metaphysical model was a necessary precondition to understanding the Bible. The political implications of his theology were even more explosive. Firstly, he declared that human conduct was to be guided solely by Scripture, not by the teachings of the church. Secondly, he denied that the church can be identified with the elect, whose identity is known only to God; this proposition undermined the legitimacy and authority of the church. Moreover, he argued that all Christians, especially temporal rulers, should know the Bible; he therefore called for the translation of the Scriptures into the vernacular. Although he did not make such translations, his followers did. The first results were overly literal and rough, but later versions more successfully render complex theological ideas in English. Wyclif subsequently criticized two earlier articulations of the doctrine of transubstantiation: he rejected both Aquinas' notion that the qualities of bread and wine are transferred from their substance to their quantity and the position of Duns Scotus and Ockham, who maintained that the accidents of bread and wine remain after the destruction of their substance through an act of divine will. Rather, Wyclif posited that the substance of bread and wine remain the same, even as their substantial form is replaced by that of the body and blood of Christ; thus the elements of the mass are simultaneously bread and wine and the body and blood of Christ. As a result, in 1382, William Courtenay, the Archbishop of Canterbury, condemned 24 propositions drawn from Wyclif's writings and barred him from teaching. After Wyclif died in 1384, his followers continued to promote his ideas. In 1409, Thomas Arundel, a later Archbishop of Canterbury, convened a commission to examine Wyclif's works. In 1411, a list of unorthodox propositions was sent to the Roman

Curia, which condemned them in 1413. Although attempts were made to suppress Wyclif's followers, dubbed "Lollards," they continued to discuss his ideas and use the Wycliffite translations, which survive in many manuscripts. Wyclif's ideas were condemned by the Council of Constance, and his works were placed on the placards of Charles V and the Indices of Leuven, Portugal, Spain, Venice, and Rome.

Jan Hus (1369–1415) lectured on the works of Aristotle and Wyclif at the University of Prague. The faculty at Prague was divided into the German camp, which generally favored Ockham's nominalism, and the Czech party, which comprised philosophical realists. Further tensions within the university were caused by the conflicting claims of the Bohemian Crown – the university was founded by Emperor Charles IV in 1348 – and the archbishops of Prague. During Hus's time, the political situation was complicated further by the rival claims of Italian and Avignonese popes. When the papacy urged the Archbishop of Prague to condemn Wyclif's ideas, Hus was drawn into a dispute about the Eucharist. As a result of shifting political allegiances, the archbishop excommunicated Hus; the sentence was confirmed by Odo de Colonna (later Martin V). Hus complained to Pope John XXIII that Wyclif's books were being burned at Prague and that indulgences were being sold to fund a war against Naples. Hus instrumentalized Wyclif's ideas in the struggles between the Bohemian Crown, the church, and the University of Prague. Wenceslaus IV of Bohemia sent Hus to face trial at the Council of Constance, under a safe conduct offered by his half brother, Emperor Sigismund. At Hus's trial for heresy, the Council demanded that he retract his ideas. Hus protested that he understood all the disputed propositions in a perfectly orthodox manner, but he was finally condemned. After he was burned at the Council on 6 July 1415, his followers split into several groups which continued into the sixteenth century, when they merged with the Protestant Reformation. Hus's works were proscribed on the placards of Charles V in the 1520s, the 1559 Roman and 1564 Tridentine Indices, the Venetian Indices from 1549, the

Spanish Indices from 1551, and the Portuguese Indices from 1551.

Lorenzo Valla (1407–1457) advocated the possibilities of classical literature in a modern context. His textbook *The Elegances of the Latin Language* (*Elegantiae linguae latinae*) contributed much to the re-establishment of classical Latin as a stylistic norm. In a subtle historical and philological analysis (1439–1440), Valla showed that the *Donation of Constantine* – a charter which purported to record the Emperor Constantine’s acknowledgment of the primacy of the church of Rome over the patriarchates of Alexandria, Antioch, Constantinople, and Jerusalem and a bestowal of huge grants of land – was a later forgery. As Valla showed, this text uses language and concepts unknown in Constantine’s day. Valla was not the first person to question the authenticity of the document – Emperor Otto III and Nicolaus of Cusa both doubted its genuineness – but he was the first to demonstrate its status beyond reasonable doubt. He also brought his philological acuity to the New Testament in a detailed comparison of the Latin Vulgate and the original Greek text. And where the late-antique philosopher Boethius defined “person” as an “indivisible substance of rational nature” (*substantia individua rationalis naturae*), Valla argued that this was not merely poor Latin, but also philosophically unnecessary: Valla preferred to define “person” as a “quality”, that which distinguishes one person from another. In his book *On Free Will* (*De libero arbitrio*), Valla distinguished between divine will and foreknowledge and argued for the importance of individual ethical choices. His work *On Pleasure* (*De voluptate* or *De vero bono*) consists of a fictional conversation between an Epicurean, a Stoic, and a Christian (who may represent Valla’s own views). The ancient pagan philosophies are surpassed by Christianity, which teaches the individual how to transcend worldly concerns and reach heaven. Although Valla clearly depicted Christianity as superior to its philosophical rivals, his positive account of Epicureanism attracted censure. He was accused of heresy at Naples, but the investigation was suppressed by King Alfonso. After Pope Nicolaus V appointed him

as papal secretary in 1448, he contributed to the rich intellectual life of the curia. Despite his prominent position at the papal court, many of his works – *On the Donation of Constantine*, *On Pleasure*, *On Free Will*, *Annotations on the New Testament*, and *On Boethius’s Definition of Person* – were placed on various iterations of the Index in Italy, Spain, and Portugal.

Marsilio Ficino (1433–1499) attempted to create a workable synthesis of Christianity and Neoplatonism. Through his reading of such ancient philosophers as Plotinus, Iamblichus, and pseudo-Hermes Trismegistus, Ficino became interested in magic. In his major treatise *On Life* (*De vita*, 1482–1489), an extended commentary on Plotinus, he outlined a system of natural magic which described the use of natural magic to ensure health and extend longevity; in the third book, he touched delicately on demonic magic, though he carefully protested that he asserted nothing contrary to the Catholic faith. Shortly after *On Life* appeared, it was investigated by the papal curia, though the intercession of Rainaldo Orsini, bishop of Florence, saved Ficino from further trouble. However, the third book was included on the 1580 Parma Index.

The thought of Giovanni Pico della Mirandola (1463–1494) was driven by the urge to find common religious themes between Christianity, Judaism, Islam, and the esoteric “Ancient Theology” of Hermes Trismegistus and Orpheus and common philosophical ground between Plato, Aristotle, Western scholasticism, and Islamic philosophy. Pico also recommended magic, theurgy, and Christian Kabbalah as means to achieving the goal of union with the divine. This syncretic tendency is worked out in the treatise *De ente et uno* (*On Being and Unity*, 1492), a torso of a larger exposition which was never completed. In a programmatic letter to Ermolao Barbaro, Pico defended the highly specialized Latin vocabulary and style used by scholastic philosophers – criticized by most humanists – as a necessary tool for the expression of the content of this philosophical school. After intensive studies of Hebrew and Aramaic, Pico had a series of 900 theses printed, which he proposed for debate in early 1487. However, a papal commission under Innocent VIII

examined the theses before the debate could take place and found 13 of the theses heretical or suspect. Pico defended his position in an *Apology*, published in May 1487. The pope was irritated by Pico's tone, condemned all 900 of the theses, and ordered that he be arrested and imprisoned. The printed text of his theses was condemned, and many copies were burned in 1491. When Alexander VI came to the throne, Pico received a pardon, though the status of his theses remained unresolved. Although his work was never placed on the Index, it was still treated with some suspicion, both for his unusual anthropology, which emphasized the potential of humans to use their reason to rise to the level of the divine, and for his treatment of the thought of Arabic and Jewish philosophers on the same terms as Christian ones.

Following the execution of Savonarola in 1498 and the restoration of the government under Piero Soderini, Niccolò Machiavelli (1469–1527) worked as a diplomat in Florentine service. When the Soderini regime was toppled, Machiavelli retired to his family estate, where he distilled his political knowledge into writings such as *The Prince* and *Discourses on Livy*. When *The Prince* was published posthumously in 1532, Machiavelli was accused of amorality, anticlericalism, and secularism. His complete works were placed on the Roman Index of 1559 and the Tridentine Index of 1564. However, editions of the Italian text printed as far afield as London were smuggled into Italy, satisfying curiosity for Machiavelli's hard-edged political analysis. A Latin translation appeared at Basel in 1560 and was reprinted often.

Desiderius Erasmus (c. 1467–1536) was arguably the greatest humanist of his generation; in any case he was the most influential. His wit and elegance charmed scholars and princes alike, while his mordent criticism of the church and his application of philology to the criticism of the New Testament and the patristic writers infuriated many conservative theologians, who considered him insufficiently qualified to comment on their professional materials. He criticized superstition, but never doubted the importance of human effort for salvation. In the minds of many, Erasmus'

criticisms of the church suggested that he and Luther were fighting on a common front. However, Erasmus never wished to separate from the church and carefully distanced himself from Luther's movement. A final break between them came over the issue of free will. Nevertheless, Erasmus' criticisms of the church and of traditional university learning made him many enemies, some of whom sought to censure him. In 1527, the Sorbonne condemned his *Colloquies*, school dialogues laced with caustic social commentary. The same year, a meeting of theologians was called at Valladolid to adjudicate the orthodoxy of a number of ostensibly representative passages from Erasmus' works. The written reports display a variety of responses, from sympathetic to hostile. In 1537, the *Report on the emendation of the church* (*Consilium de emendanda ecclesia*, 1537), commissioned by Paul III, urged that Erasmus' *Colloquies* be removed from schools, but the report was never actuated. Paul IV's unpublished Index of 1557 banned all of Erasmus' works. The Tridentine Index includes only a few, including the *Praise of Folly* and *Colloquies*. In his *Index Expurgatorius*, Arias Montano provided a list of passages that were to be struck out. Yet perhaps more serious than overt censorship was the degree of self-censorship that readers, especially in Catholic countries, imposed on themselves, declining to read Erasmus for fear of being suspected of Lutheran sympathies.

Erasmus' friend Thomas More (1478–1535) held an ambivalent attitude to censorship. A fervent defender of Catholic orthodoxy against the gains of evangelical religion in England during the 1520s and 1530s, he used his influence as Lord Chancellor to see several Lutherans punished and imprisoned. He assisted in efforts to prevent the importation of Lutheran books into England and to punish those who owned or distributed them. He also staged bonfires of evangelical literature. He also wrote vigorously against evangelical dissenters, notably William Tyndale. After More found himself unable to agree to Henry VIII's desire to divorce Catherine of Aragon and assert himself as head of the church in England, he resigned the office of Lord

Chancellor. Henry had him arrested for treason; after More had been in prison for a year, he was tried and executed. In an ironic conclusion, his *Utopia*, a highly original and ironic sketch of a hypothetical political order, was placed on the Portuguese Index in 1581 and several editions of the Spanish Index.

Martin Luther (1483–1546) revealed the disruptive power of printing to a hitherto unparalleled degree, publishing theological, devotional, and polemical works quicker than his opponents could refute them. His writings were universally and immediately condemned by Catholic authorities and appear consistently in Catholic Indices from all jurisdictions. Though feted in Protestant circles as a champion of conscience and freedom from spiritual oppression, he acted as de facto censor at Wittenberg from 1522 and advocated the suppression of the works of Anabaptists and Jews in the strongest terms.

The satirist Pietro Aretino (1492–1556) was unusual in being censored not simply for obscenity but also for religious unorthodoxy. His best known works are his *Sensual Sonnets* (*Sonetti lussuriosi*, 1524), written to accompany a series of 16 engravings by Marco Raimondi illustrating various sexual positions, and his *Reasoned Discussions* (*Ragionamenti*, 1534–1536), dialogues in which an older, sexually experienced woman coaches an innocent younger woman. The sonnets were banned by Pope Clement VII in 1527. Censors objected not simply to the material but also to the fact that it was written in the vernacular and printed, thus bringing it to the attention of the masses. However, Aretino defended obscenity as a means to expose hypocrisy. Ironically, Aretino objected to the muscular sensuality of Michelangelo's depiction of Christ in the Sistine Chapel. This ostensible disapproval may constitute revenge for Michelangelo's studied distance from Aretino. In any case, his opinion contributed to censorship of Michelangelo's fresco. Aretino's *Tre libri della humanità di Cristo* (1535) was placed on the 1557 Index, while his complete works were included on the 1559 and 1564 Indices, as well as the Spanish Index of 1583. However, such strictures did little to dampen interest in Aretino's work, and

discreet booksellers could be sure of a steady market.

The physician and religious thinker Miguel Servet (Michael Servetus, 1511–1553) wished to find common ground between Christians, Jews, and Muslims but considered the doctrine of the Trinity as a major stumbling block. His critique of the orthodox teaching on the Trinity in his works *On the Errors of the Trinity* (*De Trinitatis erroribus*, 1531) and *Restitution of Christianity* (*Christianismi restitutio*, 1553) was universally condemned by Catholics and Protestants alike. Like the Anabaptists, Servet also rejected infant baptism, arguing that only a mentally mature person could choose to undergo this sacrament. Since baptism was considered not simply as a sacrament of salvation but also as a ceremony integrating an individual into Christian society, the Anabaptist view was considered an attack on social stability. After the Inquisitor of Lyon found Servetus guilty of heresy, he fled to Geneva, which he hoped would be more hospitable. Here he was denounced by Jean Calvin, condemned by the city council, which claimed disciplinary powers in such cases, and burned on 27 October 1557. His works were placed on the Venetian Index in 1549 and 1554, the Paris Index of 1556, the Portuguese Index of 1551, the Spanish Index of 1551 and 1559, and the Roman Indices of 1554, 1559, and 1564.

Michel de Montaigne (1533–1592) developed a literary form, the vernacular philosophical essay, which drew on models by ancient writers such as Seneca and Plutarch. In 1580, when Montaigne was travelling in Italy, a copy of his published essays was seized for examination. The following April, he was informed that he was expected to make a series of cuts to the work. In the subsequent editions, Montaigne declined to make any of the changes demanded, though he did insert disclaimers: what he wrote was not the truth, simply notions submitted in search of the truth. Over the following century, his thoroughgoing skepticism became problematic in the context of Descartes's emphasis on reason. Some of his themes, such as a direct approach to sex and suicide, which endeared Montaigne to libertine writers, also began to offend a more polite

readership. Accordingly, he was placed on the Index in 1676.

The heliostatic model of the cosmos proposed by Nicolaus Copernicus (1473–1543) initially caused little concern. Nevertheless, Copernicus, foreseeing that the implicit challenge posed by his ideas to the biblical cosmology, exercised a severe self-censorship and declined to publish the fully worked-out expression of his ideas, *On the Revolutions of the Heavenly Orbs* (*De revolutionibus orbium coelestium*), until the end of his life, and even then under pressure from admirers. Protestant theologians, heavily invested in the literal truth of the Bible, generally rejected his work, despite the preface by Copernicus' editor Osiander, who guarded against rejection by couching Copernicus' theory simply as a hypothesis. The work was sufficiently popular to warrant a reprint at Basel in 1556. When Giordano Bruno and Galileo Galilei espoused Copernicus' work – admittedly for different ends – the church's attention was attracted more closely to *De revolutionibus*, which was placed on the Index in 1616. (The work was reprinted a year later in Amsterdam, safely out of the reach of the Congregation of the Index.) An expurgated version was authorized for publication in 1620, but the original text remained on the Index until 1758.

The Dominican friar Giordano Bruno (1548–1600) used Copernicus' ideas to question the foundations of the Christian world view. Even as a young friar, Bruno attracted adverse attention on account of his austere piety, which aroused suspicion of Protestant sympathies. He left the order to avoid trial. Hoping to find greater toleration in Switzerland, he enrolled at the University of Geneva. When a treatise he wrote here was judged heterodox, he was forced to destroy it. After teaching Ramón Lull's art of memory at Toulouse, he moved to Paris, where he taught on Aquinas. Henri III was so impressed by Bruno that he offered him a position at the Sorbonne. After entering the service of the French ambassador to England, he wrote works that outlined his new cosmology. His espousal of an infinite universe was theologically disturbing, since it hinted that there might be other planets with other humans who may have been saved by another

divine action, a suggestion that implied that the redemptive work of Jesus on earth was not unique. In 1585 he visited Wittenberg but was criticized for his espousal of Copernicanism. After travels through Central Europe, he found a position in 1591 as tutor to the Venetian patrician Giovanni Mocenigo. However, Bruno's new patron, shocked by his denial of transubstantiation and Christ's miracles, his unorthodox opinions about the Trinity, and his notion of infinite universes, denounced him to the Inquisition. When Bruno refused to recant, he was imprisoned and finally burned at Rome, with his books, in 1600.

In 1616, Cardinal Bellarmino, who had attempted to persuade Bruno to renounce his errors, tried to convince the mathematician and astronomer Galileo Galilei (1564–1642) to desist from promoting Copernicus' heliostatic cosmology. When the Congregation of the Index condemned a work by Paolo Antonio Foscarini, which claimed that the motion of the earth was not necessarily repugnant to Scripture, Bellarmino assured Galileo that he was not under investigation. In 1632, with Urban VIII, a supporter of Galileo, on the papal throne, the astronomer felt emboldened to publish his *Dialogue Concerning the Two Chief World Systems* (*Dialogo sopra i due massimi sistemi del mondo*), in which he presented Copernicus' ideas in an unmistakably positive light. However, the book estranged his former supporters, Urban VIII and the Jesuits. Although Galileo requested and received an *Imprimatur* from the ecclesiastical censors, the book brought a suspicion of heresy on him. He was tried and sentenced to house arrest for the rest of his life, and his works were placed on the Index until 1718. This condemnation also led others to censor their own work; Descartes, for example, rewrote his *Traité du monde* after hearing that Galileo had been condemned.

Impact and Legacy

While Robert Darnton (Darnton 2014) has shown that state censorship in eighteenth-century France could improve books when censors acted as constructive editors, the ecclesiastical censorship

exercised during the Middle Ages and Renaissance was rarely so positive. Admittedly, the demands of censors did improve the quality of printed texts. Yet when authors were forced to destroy their own work, when authorities prevented the publication of dissenting literature, burned copies after publication, expurgated offending passages, or threatened to punish or even execute those who possessed or distributed materials judged dangerous or subversive, they not merely restricted the works in question; they also discouraged thinkers from expressing non-conventional ideas that might offend and publishers from bringing such ideas to print. The extent of such self-censorship is more difficult to quantify than simply examining official organs of censorship such as the Index of Forbidden Books.

Cerameus, Nikolaos

Born: Early Seventeenth Century

Died: 1663

Dimitrios Paradoulakis

Hamburg, Germany

Abstract

Distinguished intellectual and eminent philosopher – physician of the first half of the seventeenth century.

Biography

Nikolaos Cerameus was born in Ioannina and obtained an extended and profound education in the fields of classical studies, philosophy, and theology (Sathas 1868: 322–323; Tzoga 2015). After completing his basic education in his hometown, he travelled to Venice in order to be admitted as a student in the local Greek School, and later he proceeded to higher studies at the Università degli Artisti in Padua. Certainly, Cerameus resided in the city of Venice during the 1640s and worked as an editor for the printing press of Giannantonio Giuliani. In 1646 he edited an anti-Jewish treatise entitled *Dialogue between the holy father Gregentius, Archbishop of Cefro, and a Jew named Eran* (Διάλογος τοῦ ἐν ἀγίοις πατρός ἡμῶν Γρηγορίου ἀρχιεπισκόπου Κεφρῶ γενόμενος μετὰ Ἑβραίου τινὸς Ἑρβᾶν ὀνομαζομένου). In 1652 he travelled to Constantinople at the behest of Patriarch Paisios I to work as a teacher in the Patriarchal Academy. Four years later (1656), at the instigation of Patriarch Parthenios III, he composed the following doctrinal and polemical works: (a) *Refutation Against the Unjust Prosecutors of the One and Only Holy Catholic and Apostolic God-bride Church of Christ* (Ἀντέγκλημα κατὰ τῶν ἐγκαλούντων ἀδίκως κατὰ τῆς μίας καὶ μόνης ἀγίας καθολικῆς καὶ ἀποστολικῆς θεονύμφου τοῦ Χριστοῦ Ἐκκλησίας) and (b) *Refutations Against the Primacy of the Pope in 83 Sections*

(*Αντιρρητικά κατά τῆς ἀρχῆς τοῦ Πάπα τῆς Ρώμης εἰς 83 τμήματα*). In the last years of his life, Cerameus moved to Iași, where he passed away in Galata Monastery in 1663 (Sathas 1868).

Impact and Legacy

Respected for his erudition among his contemporaries, Nikolaos Cerameus was a prolific author with his writings to be related to the mainstream scholarly fields of his time: dogmatic and polemical treatises, brief works on Divine Liturgy and the interpretation of the Holy Scriptures, lexicographical attempts, medical textbooks, and commentaries on the works of Aristotle, especially on his *Physica*, *De Caelo* and *De Generatione et Corruptione* (Tzoga 2016: 239–272). In his philosophical writings, Cerameus emerged as a prominent representative of Neo-Aristotelianism with the impact of the revised philosophical perspective by the circles of Paduan Aristotelians, especially Cesare Cremonini, to be considered distinct in his thought and word. Cerameus promoted in his philosophical writings the authority of Aristotelian philosophy in the context of the model of corydaleanism, which in his time had already prevailed in the Greek educational system. Although there is no evidence about the possibility of a direct contact between Cerameus and the originator of Neo-Aristotelianism in the Greek region Theophilos Corydaleus, the Epirote scholar knew and followed the thought of the Athenian professor and thinker, and furthermore he owned in manuscript most of his works.

Cervantes, Miguel

Miguel de Cervantes Saavedra (Alcalá de Henares, 29 September 1547–Madrid, 22 April 1616)

Hilaire Kallendorf

Department of Hispanic Studies, Texas A&M University, College Station, TX, USA

Abstract

Not normally considered a philosopher, the novelist Miguel de Cervantes nevertheless touched upon many of his era's most important philosophical themes. After a representative sampling of what might be called philosophical moments in Cervantes's works, we shall proceed systematically to examine his connection to three distinct philosophical schools or movements: skepticism, cynicism, and sophistry. We shall then consider some innovative and original aspects of Cervantes's thinking by comparing him to first Plato and then to Descartes. Finally, we will conclude with his views of both epistemology and ontology before saying a word about his legacy and influence on later philosophers.

Biography

Perhaps the world's most famous novelist, Miguel de Cervantes did not come from a background of great privilege. His father, a surgeon, was not wealthy. He spent his boyhood in Valladolid and Seville before studying with a humanist

schoolmaster, Juan López de Hoyos, in Madrid. It is doubtful whether he ever studied at any university. He travelled to Italy in 1569 before fighting for his country in the Battle of Lepanto against the Turks. There he lost the use of his left hand, occasioning the memorable epithet which he bestowed upon himself, “el manco de Lepanto.” He spent 5 years as a captive in Algiers after having been kidnapped by pirates, before finally being ransomed in 1580. Once he returned home, he was rewarded only with small and relatively unimportant government jobs such as supplying the Armada with provisions. He married in 1584 but later separated from his wife. For a while he lived again in Valladolid, where he also spent some time in jail after a man died at the door of his house under mysterious circumstances. In 1606 he moved to Madrid along with the royal court, which had previously been located in Valladolid. He died in 1616 and was buried in an unknown location within the Trinitarian convent, where he had asked to be interred out of loyalty to the Trinitarian order for organizing his ransom while captive. His literary production consists primarily of three novels – the pastoral *La Galatea*, *Don Quijote* (published in two parts, 1605 and 1615), and an unfinished romance, the *Persiles*, the prologue for which he penned on his deathbed – along with a collection of short stories known as the *Novelas ejemplares*. He was also the author of a volume of poetry, *Viaje del Parnaso*, and eight comedias with their accompanying *entremeses*, in addition to his tragedy *La Numancia*. However, he is generally considered to have failed as a poet and dramatist, an assessment which he himself might possibly have shared. His greatest works by far were in prose, with *La Galatea* and the *Persiles* also considered by many to be failed experiments. His real legacy resides in the two volumes of *Don Quijote*, the world’s first and greatest novel, and in his short stories.

Heritage and Rupture with Tradition

In the famous Prologue to Part I of *Don Quijote*, Cervantes disavows any connection whatsoever

to Plato, Aristotle, and philosophers in general, to whom the author’s “friend” refers derogatorily as “the whole horde of philosophers.” At another place in his works, Cervantes offers a playful definition of philosophy but one that nevertheless shows it to be a preoccupation for him. The two talking dogs in his *Colloquy of the Dogs* debate about what the word “philosophy” means:

Berganza: Tell me, if you know, what philosophy is. Though I use the word, I don’t know what it means. I only know it’s supposed to be good.

Cipión: Here it is in a nutshell – the expression has two Greek roots, *philos* and *Sophia*. *Philos* means love, and *Sophia* means science, so that philosophy means ‘love of science,’ and a philosopher, ‘a lover of science.’

In the course of his fiction, Cervantes refers not only to philosophy in general but also to the work of specific philosophical texts and thinkers. In fact, explicit references to philosophers and their ideas abound in Cervantes’s writing. Cascardi points to Boethius’s *Consolation of Philosophy* along with Petrarch’s *De remediis utriusque fortunae* as possible sources for some of the sentiments expressed in Cervantes’s first famous prologue to *Don Quijote*, while Ihrle traces a fairly exact parallel between the author’s oft-repeated valedictory words to his second volume and the *Essais* of Montaigne. Other, less obvious philosophical allusions also echo through the work, along with philosophical concepts that would be difficult to trace to any single source. Don Quijote’s freeing of the galley slaves may echo philosophies of natural law such as that expounded by Francisco Suárez, who wrote that all men were born free and that no man could claim a “natural” right to dominate others. Perhaps the quintessential philosophical mandate is “know thyself,” a Delphic maxim inscribed in stone in the temple of Apollo at Delphi. This nugget of wisdom appears too in *Don Quijote*, in the second part when Sancho gets to play at being governor of the *Ínsula Barataria*.

The most paradigmatic episode, and certainly the most written about, illustrating Cervantes’s connection to philosophy is the Cueva de

Montesinos. The cave is dimly lit, as in Plato's allegory, and has been read by Gagliardi as a symbol of the philosopher's contemplative life. Don Quijote emerges from the cave and recounts his experiences there in language reminiscent of Montaigne's *Essays on Experience* or Descartes' *Meditations*. Cascardi connects this episode to several important concepts from classical philosophy, including *katabasis* and *nostos*.

After the Cave of Montesinos, the second most commented-upon episode in *Don Quijote* is the adventure where the knight and Sancho imagine that they "fly" through the air on the wooden horse Clavileño. The episode of Clavileño has been interpreted in light of various philosophical and religious concepts, for example, as a burlesque symbol of the mystical flight of the soul toward God. It may be compared to a similar episode of the *Persiles* in which a horse owned by the Polish king Cratilo, who bears the same name as one of Plato's dialogues, is tamed by the hero Periandro. Cascardi innovatively relates the episode of Clavileño, the Trojan-like wooden horse on which Don Quijote and Sancho take a fanciful and utterly imaginary "ride," to the ancient spectator figure of the *theoros* who travelled abroad to witness spectacles in other lands and then returned home to report what he had seen.

Skepticism

It is generally accepted that there were two schools of skeptical thought in the classical world, the Pyrrhonian and the Academic, both active in Greece in the fourth and then third centuries before Christ. Skepticism was conceived as a reaction to more dogmatic philosophical movements such as Stoicism. Basically it questions whether any certain knowledge is possible. Skeptical ideas were diffused in the Renaissance through three fundamental texts – the *Academica* of Cicero, the biographies of ancient philosophers written by Diogenes Laertius, and the *Outlines of Pyrrhonism* by Sextus Empiricus – and through commentaries written by erudite Spaniards such as Francisco Sánchez (1552?–1623), known as the Skeptic, who wrote *Quod Nihil Scitur* (*That Nothing is*

Known), and Pedro de Valencia (1555–1620), author of *Academica sive de iudicio erga verum*.

Maureen Ihrle, in *Skepticism in Cervantes*, presents the author as demonstrating skeptical prudence and caution while avoiding essentialism, always operating on the premise that others may view reality in a different way. She catalogues the many skeptical qualifications and reservations voiced by his characters (such as, "if I am not mistaken. . .") and cites other skeptical rhetorical "moves" like multiple causation, vacillation as to the correct name of a person or an object (reminiscent of Montaigne's essay "Of Names"), the proliferation of consequences, and the chipping away at absolute certainty by systematically substituting synonyms or other labels. She concludes that *Don Quijote* as a text is infused with skeptical attitudes, preoccupations, vocabulary, and procedures, with no single character ever attaining a full grasp of the entire truth of any situation. Such is the skeptical model expressed by Montaigne when he writes "I do not see the whole of anything" ("Of Democritus and Heraclitus"). Michael Nerlich has studied the synchrony he sees between Michel de Montaigne and *The Colloquy of the Dogs*. Further work in this area has been done by Barbara Mujica, who published an essay on Cervantes's use of skepticism in his comic interlude *El retablo de las maravillas*.

The skeptical literary atmosphere of mistrust and suspicion in *Don Quijote* is heightened by the knight's lack of confidence in the *morisco* chronicler Cide Hamete Benengeli, who in turn voices doubts about the accuracy of the text he is allegedly translating. Ihrle further traces the modes of skepticism in the *Persiles*, where she notes that the protagonists interpret appearances and experiences with caution, resist their passions, and avoid hasty impulses. They also go by multiple names (Persiles/Periandro, Auristela/Sigismunda), a technique which both Cervantes and Montaigne employ to avoid essentializing (Leo Spitzer calls this *polynomasia*). If she is right, then skepticism is one bond uniting rather disparate poles of the Cervantine canon. She finds further evidence of skeptical philosophy in the stuff of grammar, notably Cervantes's heavy use of the subjunctive in *La Galatea*.

Cynicism

This strand of Cervantes's philosophical thought was studied independently by both Edward C. Riley and Alban Forcione, both of whom argue for the influence of Diogenes Laertius (author of *The Lives of Eminent Philosophers*), particularly upon his short story *The Glass Licentiate*. Riley sees the protagonist of this story, Tomás Rodaja, as embodying the negative qualities of the cynical philosopher Diogenes of Sinope. Forcione even sees Rodaja's 6-month-long illness as a possible parallel to the purifying *askesis* demanded of initiates into the Cynic sect and explains that Cervantes recreates in Rodaja's speeches the extemporaneously delivered Cynic diatribe or *chria*, which he describes as a loose combination of invective, anecdotes, maxims, and *sententiae*. It is this rhetorical aspect of Cynicism to which Cervantes refers in the *Colloquy of the Dogs* when, in reference to the etymology of the word "cynics," the dog Berganza alleges, tongue in cheek, that the name "quiere decir perros murmuradores" ("means 'dogs who murmur'").

Sophistry

The sophists were famous for arguing both sides of any question with equal vehemence, an ability Charles Presberg has studied in relation to paradoxical discourse in *Don Quijote*. Plato opposed the sophists, proposing instead that truth does exist and is knowable, even if our access to it while on earth remains limited. The scholarship on Cervantes's relation to sophistry is divided, but critics seem to agree that this ancient philosophical and rhetorical movement does appear explicitly in his works. The most important study in this area is Heinrich Merkl's *Cervantes anti-sofista: Sobre Platón, Ficino, y los tres Quijotes* (1605, 1614 y 1615), which covers both parts of Cervantes's *magnum opus* as well as the spurious sequel by Avellaneda. Merkl argues for Cervantes's familiarity with the Platonic dialogues as well as the sophist Lucian of Samosata, although Plato's ideas would have also been available to him by way of contemporaneous Spanish authors such as León Hebreo and Juan Huarte de San Juan. Merkl's basic thesis is that Cervantes contradicts what he calls "el conjunto ideológico

sofista" (the sophists' ideological conglomerate), a philosophical grab bag containing, among other elements, the famous "man is the measure of all things" along with the assertion that all opinions are equally true (a corollary to which is the impossibility of error). Merkl sees the priest and the barber in *Don Quijote* as sophistical and therefore targets of Cervantes's attack on sophistry.

At other points in the novel, however, sophistry appears in ways that are more subtle. Anthony Cascardi sees the picaresque autobiographer Ginés de Pasamonte, who later becomes the puppet master Maese Pedro, as imbued with sophistical ideals and strategies. Cascardi mentions that a specific text, *The Sophist*, written by Plato, had been discussed by Pico della Mirandola and was the subject of a detailed commentary by Marsilio Ficino. Cascardi presses the analogy even further when he calls Don Quijote himself an "amalgam of philosopher and sophist." In doing so, Cascardi seems to refute Heinrich Merkl's claim that Cervantes is anti-sophistic. But perhaps a compromise position between their two views may be reached by virtue of the fact that Plato associates poetry with sophistry, while Cervantes – according to Cascardi – follows the Neo-Aristotelian Torquato Tasso in distinguishing clearly between poetry and sophistry, in particular by citing the possibility of the so-called "legitimate marvelous."

Innovative and Original Aspects

Contrast to Plato

Cervantes may well have sided with Plato in denouncing the sophists, although it would be a mistake to assume he embraced Platonism as a satisfactory alternative to their deviousness; indeed, Merkl claims that the second part of *Don Quijote* may be designated both anti-sophistic and anti-Platonic. If this is so, it would mark an evolution in Cervantes's thought in the years subsequent to the publication of his *Galatea*, a pastoral novel often said to be steeped in Neoplatonism. Cervantes's ambiguous and often vexed relationship to Plato and Renaissance Neoplatonism has been dissected most shrewdly by Anthony

Cascardi, who makes the important distinction that Cervantes, unlike Plato, does not present us with any way to distinguish between true and false myths. Any sense in which Cervantes could be considered a Platonist would have to be limited to a handful of discrete, fully contextualized, and non-generalizable examples, which may well be seen as coming almost exclusively from his early works.

Contrast to Descartes

When seeking to attribute to Cervantes some form of philosophical innovation, some critics contrast him with Plato but far more compare him to René Descartes. Scholars such as Américo Castro have long seen in Cervantes a precursor of Descartes, although with the obvious qualification that the novelist made no pretense to any sort of systematicity. Cascardi contrasts and then compares Cervantes with Descartes, ultimately concluding that out of fear of the Inquisition, Cervantes employs strategies of masking – similar to the ones Descartes found – to speak obliquely about controversial topics.

These alleged similarities to Descartes and his method may hold some validity. With regard to the Cueva de Montesinos, however, Cascardi regards Cervantes as anti-skeptical – in other words, he thinks knowledge is possible but “not submissible to reason.” In fact Cascardi views the cave episode as a possible critique of Descartes’ dream argument *avant la lettre*. In a different version of the same argument, in which he emphasizes Anselmo’s frustrated demand for tangible proofs and empirical tests of his wife’s faithfulness in the intercalated tale of “El curioso impertinente,” Cascardi states categorically that the *Quijote* is both anti-skeptical and antirational.

Epistemology and Ontology

If Cervantes critiqued, at least implicitly, the epistemological assumptions of his day, what would he propose to fill the void left by their absence? He seems to validate intuitive ways of knowing, or epistemes, which may be more appropriate for the literary world than cold scientific analysis. This form of philosophizing, sometimes called “noetic” (from Aristotle’s Greek word for

intuition, or *nous*), privileges figurative language, for which it finds a place within the reasoning process. Noetic philosophy insists that not all knowledge is demonstrable, but it remains valuable nonetheless. Indeed, Emilio Hidalgo-Serna sees in *Don Quijote* a condemnation of rationalist metaphysics.

Cervantes may have condemned rationality, but he often concocted unique linguistic solutions to ontological questions, as with his much-commented-upon neologism *baciyelmo*. In this and other instances, he betrays a preoccupation with ontology, what Alban Forcione has aptly called “the nature of truth itself.” Forcione emphasizes Cervantes’s affinities with Aristotle and the Renaissance Neo-Aristotelians who shared the belief that art must deal responsibly with truth. While Neo-Aristotelians such as Torquato Tasso, arguing for Christian humanistic concepts like the legitimate marvelous, tried to push the concept of verisimilitude as far as possible toward literal truth, Forcione argues that Cervantes employs reason to undermine the rational system. But it is actually a very different thing to say there is no truth than to say there is truth, but it may not be knowable. Maureen Ihrle believes that Cervantes’s fideism kicked in right at the point where his skepticism ran out – in other words, there are some things he (as a devout Catholic) was just willing to take on faith. This was a common combination of belief systems during this time period, including for other Christian Humanist authors in Spain such as the slightly later picaresque novelist and poet Francisco de Quevedo.

Impact and Legacy

E. C. Graf sees the influence of *Don Quijote* on the English political philosopher Thomas Hobbes. He notes that Hobbes refers to *Don Quijote* explicitly in *Human Nature* (1650), which argues for a skeptical approach as the solution to fallible human perceptions, and claims that Hobbes had the knight errant in mind when he wrote his more famous *Leviathan* 1 year later. Graf further traces the influence of Cervantes through Hobbes to

David Hume (1711–1776), who is considered to be the father of pragmatism.

To follow what is perhaps a less circuitous line of descent, Cervantes is known to have influenced later Spanish philosophers Miguel de Unamuno and José Ortega y Gasset. The existentialist Unamuno in particular believed the *Quijote* to be representative of what he saw as a uniquely Spanish philosophy. Ortega y Gasset in turn proclaimed the doctrine of *quijotismo*, which may merely be a synonym for perspectivism. Ortega urged Spaniards to live quixotically, which for him meant to “decide not to be satisfied with reality.”

Abstract

Andrea Cesalpino is an important figure in the history of science. He demonstrated that blood circulates into heart from veins and from the heart to arteries, paving the way to Harvey's complete description of blood circulation. Moreover, he was the founder of botany as a systematic discipline, which he based, rather than on the observation of accidental similarities of plants, on the discovery of their vegetative-generative principle. In philosophy, he attempted to conciliate the immortality of the soul (i.e., the form of the body) with the existence of a unique immaterial intellect, which is individuated and multiplied in the singular souls that participate to it.

Alternate Names

Cisalpino, Andrea; Caesalpinus, Andreas

Biography

Andrea Cesalpino was born in Arezzo in 1524 or 1525 (Repici 2005, 47–48, n.1). Between 1544 and 1551 he studied in Pisa, under Luca Ghini (professor of botany), Realdo Colombo (anatomy), and Simone Porzio (philosophy), attending also the anatomical lectures of Vesalius. He obtained a doctorate in medicine in 1551, and in 1555 he became director (*prefetto*) of the botanic garden (*Orto dei semplici*) in Pisa, succeeding its founder Luca Ghini. In 1555 he started his teaching at University of Pisa, where he lectured for 36 years, although not with continuity: He taught medical botanics for 16 years and then practical medicine as ordinary professor for 20 years (s.n. 1755, 6–7). In these years he published his major works in philosophy, i.e., the *Quaestiones peripateticae* (1571, 1929) and *Daemonum investigatio peripatetica* (1580) and his *De plantis* (1683) in botany. Between 1582 and 1584 Galileo probably attended his lectures. In 1592, he moved to Rome, after having being defamed by his colleague in philosophy Francesco de Vieri, who accused him of propagating the ideas of Telesio. Also, he probably did not meet the expectations as a botanic of the Grand Duke, as testified by the belated publication of his *De plantis* (Repici 2005, 47–48, n.1). In Rome, he became physician of the Pope Clemente VIII and published his *De metallicis* (1596). He held a lecturer position in medicine at the *Sapiientia* University until his death in 1603 (s.n. 1755; De Ferrari 1980; Repici 2005).

Original Aspects and Legacy

Cesalpino is an important figure both for the history of science and for the history of philosophy. First, he paved the way to Harvey's discovery of the circulation of blood. Building upon the discovery of Vesalius and Realdo Colombo that blood does not pass through the pores of the cardiac septum (as maintained by Galen), Cesalpino ascertained by anatomical observations on ligatures of veins that blood perpetually

circulates into heart from veins (vena cava and peripheral veins) and from the heart to arteries. In this way, he foreran Harvey's discovery that the centripetal movement of blood to heart is by veins only (Cesalpino 1571, 1583, 1602; Pagel 1967, 169–171; Bylebyl 1972; Pagel 1975). Moreover, Cesalpino inaugurated botany as a systematic discipline. He aimed to rewrite the pseudo-Aristotle's *De plantis*, which he found to be inconsistent with Aristotle's zoology, and to replace Theophrastus' classification of plants based on exterior similarities only. Cesalpino's *De plantis* consists of a classification of plants not provided with illustrations, as he wanted to give scientific descriptions rather than representations. His classificatory criteria prescribe not to look at similarities concerning singular parts of plants, and to find their vegetative-generative principle, shown by fruits and seeds (Repici 2005). In his *De metallicis* he provides an explanation of the formation of fossils consistent with the retreat of the sea. Finally, his teaching of mechanics constituted the Aristotelian background of Galileo's mechanics, as he dealt with the composition of motions (Helbing 2008).

In philosophy, Cesalpino attempted to rediscover the “original” thought of Aristotle (Repici 2005, 51–53) and, in doing so, to solve the problem of the immortality of the soul raised by Pomponazzi, who maintained on the basis of *De anima* that soul performs all its knowing activities with corporeal imagination and it is therefore mortal (Sellars 2016). To solve this problem, Cesalpino argues that intellect is a potency or faculty, i.e., it is not a substance, and that it is not separated from the body; at the same time, intellect is not mixed with the body and is in itself intelligible, in order to make corporeal images intelligible. Secondly, he defines human soul (which is the form of the body) as participating to the unique immaterial substance or intelligence, i.e., God, which is separated from the world and is located in the first heaven. In this way, soul can participate of the intellect and individuate it in singular bodies. However, Cesalpino could not solve the problem of the loss of individuality of

soul after the death of the body itself (Cesalpino 1571, 1580; Colombero 1977).

Cisalino was portrayed as a main sample of impious Aristotelianism by Nicolaus Taurellus, since his idea of participation entails that of universal animation, and by Samuel Parker, accusing him of atheism as he maintained that first intelligence is speculative, i.e., not directed to the providential ordering of the world (Taurellus 1597; Parker 1678; Colombero 1980, 343–345). Moreover, Cesalpino's idea of the participation to a unique immaterial substance was labeled as proto-Spinozist by Pierre Bayle (1734; Colombero 1980, 349–354).

Cesi, Federico Angelo

Born: February 26, 1585, Rome

Died: August 1, 1630, Acquasparta

Filip A. A. Buyse

St Cross College, University of Oxford,
Oxford, UK

Abstract

Federico Angelo Cesi (1585–1630) was a Roman-Umbrian patrician who was the founder and patron of the Accademia dei Lincei. Direct seeing, without the peripatetic filter, was essential for the Linceans. Cesi used a compound microscope which the Lincean Galileo Galilei had invented but which had been perfected by the brothers Kuffler, who had distributed it in Rome. With the use of this optical device, the Prince produced several collections of precise drawings of his observations of insects, fungi, fossils, and plants. The naturalist was one of the first in the history of science to publish microscopic observations of plants. Cesi also proposed a system of classification of plants and aimed to establish the foundations of the science of plants.

Biography

Federico Angelo Cesi was a Roman-Umbrian patrician. He was the eldest of seven brothers, and born in Rome on February 26, 1585. He was the son of Federico Cesi (hereditary Marquis of Monticello and Duke of Acquasparta, and later made a prince by Pope Paul V) and Olimpia Orsini. Federico's uncle, Bartolomeo Cesi, was a cardinal in the Roman church, and most of the family's wealth came from that connection. The young Cesi was educated privately and he became particularly interested in the natural sciences at an early stage in his life. His father strongly opposed

this career direction, but his mother supported him morally as well as financially (Drake 1957).

In 1603, at the age of 18, Cesi founded the Accademia dei Lincei (the “Academy of the Lynx-Eyed”, anglicised as the Lincean Academy). In a charter (*Lynceographum to Praescriptiones Academiae Lynceorum...*) – which was never published – that he began to compile in 1605, the goals and numerous prescriptions of the academy were stated to be “...not only to acquire knowledge of things and wisdom, and living together justly and piously, but also peacefully to display them to men, orally and in writing, without any harm” (Galluzzi 2017). Cesi devoted the rest of his life to these goals and his academy. The founder and his friends aimed to understand all the natural sciences and to inform the public via discussions about, and publications of (Cesi 2003), their observations. But above all, it was clear from the start that Cesi and the fellow Lycians were embarking on the very important enterprise of liberating consciences and nature itself from the tyranny of Aristotle and his followers (Galluzzi 2017). Through its activities, the Accademia distinguished itself from other Italian societies which, at that time, were much more devoted to literature and the classics. The Accademia served as a prototype for the Royal Society of London and the French Academy of Sciences.

Cesi was more than just a founder of the Accademia. He proudly called himself not only

the “Prince and Founder of the Association” [*Consessus princeps et institutor*], he was also its sole funder. It was very much a personal academy. Hence, after his sudden death in 1630, the academy died with him.

Meetings took place in his palace where he provided the fellows with a botanical garden, a natural history collection, a library, and scientific instruments. Moreover, the Linceans resided in Cesi’s palace in Rome where they lived communally and almost monastically. Besides Cesi, the three initial members of the Academy were the Dutch-born physician Johannes Van Heeck (1579–c. 1620), who changed his name to Giovanni Ecchio (Heckius 1605), and two fellow Umbrians. These were the mathematician Francesco Stelluti (1577–1653) and polymath Anastasio de Filiis (1577–1608) (Stelluti and Rycke 1625) who was a relative of Cesi. The Academy’s most famous members, however, were Luca Valerio (1553–1618), Giambattista della Porta (1535–1615) and Galileo (1564–1642) who joined respectively in 1610 and on April 25, 1611. After Galileo’s induction the membership grew rapidly. At its height, by 1625, the Accademia had 32 members, not only Italians but also foreigners such as Johann Faber (1624), Mark Welser, and the young German botanist Giovanni Battista Winther, who was Cesi’s physician from 1624.

Cesi’s Accademia was named after “Lincei” (Italian for lynx) which came from Giambattista della Porta’s book *Magia Naturalis* (1558) (Della Porta 1589), which had an illustration of the fabled cat on the cover and the words “...with lynx like eyes, examining those things which manifest themselves, so that having observed them, he may zealously use them”. Additionally, as each of the found members, Cesi (1980) adapted also a name that symbolically expressed his personality. *The Prince* adopted *Coelivagus* (Wanderer of the heavens) and chose the eagle bathed by the Sun’s rays bearing the Earth in its talons with the motto “utrumque,” to indicate his knowledge of both the celestial and the terrestrial worlds (Galluzzi 2017). The Linceans choose the lynx and the eagle as their symbols because both animals

were known for their keen senses. However, the name of Cesi's Accademia referred also to Lynceus, the argonaut of Greek mythology renowned for his sharpness of sight (Galluzzi 2017; Freedberg 2002) (Fig. 1).

Direct seeing and observing things in nature, without the filter of the Peripatetic Philosophy, was essential for the Linceans. Not only seeing with the naked eyes but also – and perhaps more importantly – with the use of optical instruments. In 1609, Galileo had invented a new telescope. With this improved version of the “Hollandsche kijker,” he made spectacular observations which he commented in his *Sidereus Nuncius* (1610) and the *Letters on Sunspots* [*Istoria e dimostrazione intorno alle macchie solari*] (1623). The latter book was – just as the *Assayer* [*Il Saggiatore*] (1623) which stated that the universe is a grand book “which stands continually open to our gaze” – published by Cesi's Accademia. Directly after his invention, however, Galileo adapted his telescope to look at small things. The result was a double lens instrument different to the one lens microscope which would be used later by A. van Leeuwenhoek (1632–1723) in Holland. On September 23, 1624, Galileo had sent Cesi an *occhialino* (or *occhiale*) to view “the smallest things as if from nearby.” Initially, this microscope had a convex objective and a concave ocular lens. However, Cesi managed to obtain a microscope with two convex lenses and a better magnification from Cornelius Drebbel's brothers-in-law, the Kufflers, who had recently arrived in Rome. By mid-April of 1625, the Lincean Giovanni Faber (1574–1629) introduced the modern name “microscope” [*microscopio*] for Cesi's new compound *occhiale* (Freedberg 2002).

Cesi did not just observe with his new microscope; he applied the microscope in a very innovative way. The founder of the Accademia published the first record of microscopic observations, more precisely of bees, in his *Apiarium* (1625) long before Robert Hooke (1635–1703) would publish his *Micrographia* (1665) and Antoni van Leeuwenhoek (1632–1723) would note his observations. The first microscopy

illustrations, however, were published 5 years later in Stelluti's book, *Persio* (Freedberg 2002). The *Apiarium* (Cesi 1625a, b, and 2005–2006), was published by the Linceans in celebration of Urban VIII's first Jubilee year and printed on four large separate sheets (that measures 107 × 69.5 cm) joined together. Cesi and the Lycians, however, did not only apply optical instruments in order to observe the eyes of a fly, cheese mites, a louse, a vinegar fly and other insects, they also used the microscope [*“microscopio spectatus”*; *“microscopio observatus”*, *“ex microscopio”*] and other optical instruments to observe fossils, plants, fungi, and the fauna and flora of South America. Cesi was among the very first to produce botanical drawings with the aid of a microscope (Pegler and Freeberg 2005).

In addition to the activities already mentioned, Cesi's Accademia was also interested in other disciplines such as astrology and alchemy (influenced by Paracelsus) (Ricci 1992). As he made clear in the *Lynceographum* (Cesi 1904 and 2001), the Prince attributed great value to the disinterested study of chemistry, which he considered a useful means to throw light on the operations of nature (Clericuzio and De Renzi 1995) (Fig. 2).

Cesi and the other Lynceans shared the ambition of compiling an entirely new inventory of nature in the awareness that the traditional encyclopedia had been superseded by the flood of new data emerging from geographical discoveries (Galluzzi 2017). The number of drawings, which Cesi and his companions made with great skill and precision, is overwhelming. Today several collections of Cesi's drawings are available and have been documented. Most of them are part of the so-called Cassiano dal Pozzo's “Paper Museum” which is a collection that the Lincean Cassiana acquired in 1633 from the widow of the founder of the Accademia. Most of the “Paper museum” which includes among others a collection of Cesi's drawings is preserved in the Royal Library at Windsor Castle (Montagu et al. 1997).

Included in this collection is the The Erbario Miniato (“illuminated herbal”). These albums of

Cesi, Federico Angelo, Fig. 1 Frontpage of Galileo's *Il Saggiatore* (1623) with the symbol of the Accademia dei Lincei. (With permission of the History of Science Collections of Oklahoma University)

211 drawings not only depict the native flora of central Italy, but also mycological specimens, rarities from across Europe, and recently imported species from the New World such as the crown imperial, the tobacco plant, the tomato, and the aubergine (Garbari and Tomasi 2007). In

Cesi, Federico Angelo, Fig. 2 Illustration from Stelluti's *Persio tradotto in verso sciolto e dichiarato* (1630). (With permission of the History of Science Collections of Oklahoma University)

the years after the compilation of *The Erbario Miniato*, Cesi was engaged with ambitious programs of botanical illustration. The preparation of

the *Tesoro Messicano* engaged him for much of the rest of his life. The first incomplete version of this work was published in 1628 and completed

in 1651 by his successors after his death. In the first edition of the *Tesoro Messicano*, Cesi proposed his system of classification (*Tabulae Phytosophicae*) of plants with the aim of establishing the foundations of a science of plants (*phytosophia*). Just as Linnaeus (1707–1778) would do much later, Cesi tried to find a sign that was characteristic of a species. The kind of distinctive signs for which Cesi searched were, however, often beyond the scope of the naked eye but within the reach of the microscope. In this *Tesoro Messicano*, Cesi added to the complex schemata and diagrams lengthy digressions demonstrating his literary and scientific learning with many references to the works of Pliny, Virgil, Theophrastus Galen, Dioscorides, and Pietro Andrea Mattioli (1501–1577).

Around 1622, Cesi was also compiling a new collection of drawings which are also included in the collection of Cassiano dal Pozzo. These are now preserved in the Bibliothèque de l'Institut de France in Paris (Chamoux 1997). This collection was rediscovered and subsequently brought to attention in 1980. Three of the eight volumes of the Paris drawings are devoted to fungi and five mostly to flowers and plants. This corpus includes about 1900 drawings depicting the subjects in minute detail and sometimes observed through a microscope. These drawings differ greatly from the drawings of *The Erbario Miniato* (Garbari and Tomasi 2007). The two sets of drawings clearly represent different stages in Cesi's botanical investigations. In his later work, Cesi's main concern is to understand not only the form but also the function of the different plant structures.

Cesi died on August 1, 1630, at the age of 45 after a brief high fever. His Accademia died out after his death despite the efforts of some of its members. He was survived by two daughters from his second marriage to Isabella Salvati, who was the daughter of the Marquis of Lorenzo. His library, scientific instruments, and manuscripts, dispersed after his death, have now been largely reacquired by the present Accademia dei Lincei in Rome, which was reconstituted as a national academy in 1875 (Aiton and Drake 1959).

Bedford New College, Surrey, UK

Abstract

Demetrius Chalkokondyles (1423–1511) was a humanist, a scholar, and an editor. He was a Byzantine émigré who had a long teaching career in Western Europe, being engaged in the teaching of Greek letters at prestigious Italian universities (Padua, Florence, Milan). Chalkokondyles was also a pioneer in the editorial activity of Greek texts in fifteenth century Italy. He contributed greatly to the intensification of Greek learning and the advancement of the study of philosophy in Renaissance Italy.

Biography

Demetrius Chalkokondyles' name is also spelled Demetrios Chalcocondyles, while his surname is found in various ways, for example, Chalcondylas, Chalkondyles, Chalcondyles, as Chalkokondyles, “the man with the bronze pen,” or as Chalkokandyles, meaning “the man with the bronze candlestick” (Cammelli 1946). Born in Athens in 1423, Demetrius was the scion of a noble Athenian family, son of Basilios Chalkokondyles (ca. 1393–1487) and related to the historian Laonikos Chalkokondyles (ca. 1430–1468?). The Chalkokondyles family found refuge in the Mystras after it was expatriated from Athens, due to the participation of George Chalkokondyles, Demetrius' uncle, in an unsuccessful coup against the Acciaiuoli (1390–1460), the Florentine ruling party of Athens. Though it cannot be confirmed, it is possible that Demetrius followed his family and left his native city for the Peloponnese (Cammelli 1946).

At the age of 26, Demetrius arrived in Rome (1449), where he came in close connection and was taught by the Greek humanist Theodore Gaza (ca. 1398/1410/15–1475/6), to whom Chalkokondyles refers to as a teacher and guide (*kathigemōn*) (Noiret 1887). The two men retained a long friendship, and their close relation is confirmed also by the fact that Demetrius inherited Gazas' library after the latter's death. In 1452 and possibly for the following 3 years, Demetrius was in Perugia teaching Greek. In 1455 he returned to Rome, where he resided for a few years. There he entered the literary circles of Italian and Greek humanists and forged strong links to the scholar and philosopher Cardinal Bessarion (ca. 1400/08–72). It was during that period, around 1462, that he was involved in the controversy about the superiority of the philosophy of Plato or Aristotle, a matter engaging Renaissance humanists. Theodore Gaza, a supporter of Aristotelian theories, was challenged by the Platonist Michael Apostolis (ca. 1420/22–1478). Chalkokondyles, though a Platonist, appears to have advocated a moderate approach, and honoring his friendship with Gaza, he defended his teacher against Apostolis' accusations (Cammelli 1954).

In 1463, Chalkokondyles was appointed to the chair of Greek studies at the University of Padua, where he taught until 1472 or 1475. Chalkokondyles provides, in his inauguration orations, information concerning his appointment and teaching activities in Padua. It is most possible that he received the position with the support of Theodore Gaza, Francesco Filelfo (1398–1481), Palla Strozzi (1372–1462) (Cammelli 1954), and Cardinal Bessarion. It is also recorded that Chalkokondyles "at Padua was the first teacher of Greek who received a fixed stipend in any of the universities of Europe" (Sandys 2011; Geanakoplos 1974). Prominent scholars of the Renaissance, such as Ianos Laskaris (ca. 1445–1534), Hartmann Schedel (1440–1514), Giovanni Lorenzi (ca. 1440–1501) – who assisted Chalkokondyles with the correction of the *Planudean Athnology* in 1466 – Guarino Favorino (ca. 1445–1527), Nikolaus Laonikus Tomaeus (1456–1531), and

Andrea Brenta (ca. 1454–85), were among his students in Padua.

Continuing his teaching activity, Demetrius came, again with the help of Francesco Filelfo, to Florence. There, he succeeded John Argyropoulos (ca. 1393/4, 1405/10/15–1487) and Andronicos Callistos (ca. 1400–1480) in the chair of Greek studies and taught at the Florentine *Studium* for 16 years, from 1475 to 1491, having as students several humanists of the Renaissance. Among his students were Giovanni de' Medici (later Pope Leo X) (1475–1521), Piero de' Medici (1471–1503), Michael Marullos Tarchaniotes (ca. 1453–1500), Cristoforo Landino (1424–1498), Giovanni Pico della Mirandola (1463–1494), Alessandra Scala (1475–1506), Thomas Linacre (ca. 1460–1525), and William Grocyn (ca. 1449–1519) from England, and the German Johann Reuchlin (1455–1522). Concurrently with Chalkokondyles, between the years 1477–1481, the scholar and Aristotelian philosopher John Argyropoulos taught in the Florentine *Studium*, which he had previously abandoned. The competition for the chair of Greek at the *Studium* between Chalkokondyles and Angelo Poliziano (1454–94), recorded primarily by Paolo Giovio (ca. 1486–1552), appears somehow problematic (Legrand 1885). Other evidence pointing to a friendship between the two scholars, as for example, the laudatory epigrams Poliziano dedicated to Demetrius upon his arrival to Florence, and their depiction alongside in a fresco found in the church of Santa Maria Novella in Florence dated in 1498 (Vasari 1996; Cadogan 2000), cannot lead to safe conclusions (Cammelli 1954). It is confirmed that Chalkokondyles was well received in Florence, while his teaching of Greek language, philosophy, poetry, and rhetoric was fruitful and successful, though no specific information concerning the exact curriculum can be found. At the same time, Demetrius was involved in translating and editorial activities, such as the Latin translation of Plato's works published in 1491 in Venice by Marsilio Ficino (1433–99) and the first edition of Homeric works in Greek in 1488.

At the invitation of the Duke of Milan, Ludovico Sforza (1452–1508), Chalkokondyles

went in 1491 to Milan, where he further pursued his teaching activities, once again crowned with success, as it becomes evident from his students, being among others Baldassare Castiglione (1478–1529), Gian Giorgio Trissino (1478–1550), Giovanni Maria Cattaneo (d. 1530), Giglio Gregorio Giraldi (1479–1552), once again Johann Reuchlin, as well as Guillaume Budé (1468–1540). It has been suggested that it was actually Chalkokondyles who initiated the systematic learning of Greek studies in Milan (Cammelli 1954). Continuing his editorial activities in Milan, Demetrius edited and published Isocrates' *Orations* (1493), his own grammar entitled *Erotemata* (1494) as well as the *editio princeps* of *Suda* Lexicon in 1499. It is also possible that Demetrius produced a translation on Galen's *On Anatomical Procedures* that was printed in 1529 in Bologna (Legrand 1885). Chalkokondyles left Milan most probably in 1499 at the time of the French invasion in the city, and was invited back to the city in 1501 by the French Georges d'Amboise (1460–1510), king Louis XII's (1498–1515) advisor, and continued his teaching until the end of his life. He died in Milan on 9 January 1511 at the age of 88.

Heritage and Rupture with the Tradition

Demetrius Chalkokondyles is recorded to have had the longest career among the Greek émigrés active in Italy. He contributed with his teaching and editorial activities to the development of Greek learning in Renaissance Italy for over 35 years. His teaching methods and choice of curriculum, which resemble those followed in Byzantine *enkyklios paideia*, show that he was a genuine representative of the Palaeologan Renaissance in the West. Chalkokondyles' appointment to the newly established chair of Greek in Padua and his success, was a turning point in the cultivation of Greek studies in Italy. The inaugural speeches, which were composed in Latin, were delivered by Chalkokondyles in Padua and edited by his student Hartmann Schedel, provide information about his teaching methods. Apart from grammar, Chalkokondyles taught “poetry and

oratory” and philosophy, considering that it was a prerequisite for those engaged in philosophical endeavors to have a mastery of the Greek language in order to “fully and correctly” understand Greek philosophy and hence produce adequate Latin translations (Geanakoplos 1974). Without appearing dismissive of the Latin language, Demetrius appears to have realized the increasing interest in Greek studies, which were promoted by the Byzantine émigrés, in the Renaissance humanists' efforts to gain a better learning of the Greek language in order to understand ancient Greek culture (Geanakoplos 1974). This becomes clear with his remark “how much utility, how much style and perfection they [Greek letters] bring and how the study of Greek literature has explained and does explain Latin letters” (Geanakoplos 1974).

Chalkokondyles followed the trends of the Byzantine exiles in yet another aspect, i.e., the propagation of the idea of a crusade for the liberation of the occupied Greece from the Ottomans with the support of the Latin West. Of interest is his statement that “just as she [Greece] had expended for them [the Latins] all of her most precious and outstanding possessions liberally and without any parsimony, and had restored into her state with her hand and force of arms Italy, long ago oppressed by the Goths, they [the Italians] should in the same way now be willing to raise up prostrate and afflicted Greece and liberate her by arms, from the hands of the barbarians” (Geanakoplos 1974). Yet, unlike his contemporary Byzantine scholars, who emphasized that the West was indebted to ancient Greece, Chalkokondyles appears to be indirectly placing emphasis in the significant role of Byzantium in the transmission and preservation of Greek culture in the West.

Impact and Legacy

Although there is no evidence concerning the precise philosophical texts he taught in Italian universities, Chalkokondyles contributed greatly to the development of Renaissance philosophy and humanism. In Padua, it is possible that he

taught Aristotle, especially his scientific treatises (Geanakoplos 1976, 1989). Demetrius was not actively involved in the debate over ancient philosophy which took place in the West, although he appears to have been an advocate of Platonic theories. This is of extreme significance especially in the context of the direction philosophical learning in the Florentine *Studium* took, which until the time of the assumption of the chair by Chalkokondyles was directed towards Aristotelian teachings. Hence Chalkokondyles played a major role in the cultivation of Platonic studies in Florence, at a time when Marsilio Ficino's (1433–99) *Platonic Academy* was at its prime, being supported by Lorenzo de' Medici (Cammelli 1954). Nevertheless, there is evidence indicating that at the time when Chalkokondyles and Argyropoulos were teaching in Florence the debate concerning the prevalence of Platonic or Aristotelian philosophies has been settled. A more moderate approach was promoted and, despite the existence of two groups, students would attend lectures on both Plato and Aristotle. (Della Torre 1902; Cammelli 1954).

Chalkokondyles' most important legacy was his editions. More specifically, the *editio princeps* of the Homeric works produced by Chalkokondyles and printed in Florence in 1488 is considered of enormous importance for the promotion of Greek learning and of Homeric studies in particular. The edition, which was financed by Chalkokondyles' students Bernardo and Neri Nerli, was produced with the assistance of Giovanni Acciaiuoli (1460–1527) and printed by Demetrios Damilas (d. 1510?), included Homer's *Hymns*, the *Iliad* and the *Odyssey*, the pseudo-Homeric *Battle of Frogs and Mice*, as well as Herodotus's and Plutarch's *Life of Homer* and Dio Chrysostom's oration 53 *On Homer*. The edition is not original, given that the text resembles that transmitted in Byzantine manuscripts (Cammelli 1954). Nevertheless of interest is the editorial method followed by Chalkokondyles, and the reconstruction of the text with the use and collation of manuscripts, as well as of "Eustathius' commentary" (Legrand 1885), i.e., the annotations on Homer produced by Eustathius

of Thessalonike (twelfth c.). Demetrius emphasizes the value of Homeric works as "a source of the Greek language, an example of human affairs and a luminary for Greek and Latin poets" (Legrand 1885), pointing also to the necessity of printed books for learning. The utility of books for learning and for the study of philosophy is stressed by Demetrius also in the preface of his edition of the *Suda* Lexicon (1499) (Legrand 1885).

Chalkokondyles' awareness of the necessity of printed editions and his application of proper didactic methods during his long teaching career indicate that he was one of the most influential Byzantine scholars who promoted Greek culture and learning in Renaissance Italy. As the Renaissance humanist Piero Valeriano (1477–1558) wrote in his *De litteratorum infelicitate* (*On the Ill Fortune of Learned Men*) "Demetrius Chalcondyles, is responsible for the fact that Greek letters in our time are now flourishing, after being rescued somehow from destruction" (Valeriano 1999).

Chalkokondyles, Laonikos

Born: Athens, ca. 1423/1430

Died: Unknown, after 1464/1468

Christina Kakkoura

University of London, Royal Holloway and
Bedford New College, Surrey, UK

Abstract

Laonikos Chalkokondyles was a seminal Byzantine intellectual and historian. He belongs, together with George Sphrantzes (1401–77/8), Doukas (ca. 1400–70) and Michael Kritoboulos (ca. 1406–10), to the group of the four Byzantine historians who recorded the events of the Fall of Constantinople (1453). Laonikos is one of the few Byzantine historians who dealt extensively with the history of the Ottomans (Tōmadakēs 1993). He composed a history in a way that he “seems to have taken oral . . . traditions and transformed them into Herodotean-Thucydidean narrative prose” (Kaldellis 2012a), relying at the same time upon various sources. He contributed to the cultivation of the study of Byzantine and Ottoman history and of ancient Greek historiography in the Renaissance, and was influenced by ideas about historical causation.

Biography

Laonikos Chalkokondyles, also spelled Laonicus Chalcocondyles, while his surname is found in various versions, Chalkondyles, Chalcondyles, Chalkokondyles, “the man with the bronze pen,” or as Chalkokandyles, meaning “the man with the bronze candlestick,” with Laonikos being most possibly an anagram of his real name Nikolaos (Miller 1922). Very little is known about his life, and information concerning his exact date of birth, which is placed either in 1423 or 1430, vary (Nicoloudis 1996; Akisik 2013). He was the scion of a noble and distinguished Athenian family, related also to the scholar and humanist Demetrios Chalkokondyles (1423–1511). His father, the “learned George” (Cyriac of Ancona 2003), was involved in a plot against the Florentine ruling party of Athens the Acciaiuoli. The failure of the conspiracy led the Chalkokondyles family to flee from their native city (1435) and sought refuge in the Mystra, at that time under Despot (1443–48) and future Byzantine emperor Constantine XI Palaeologus (1448–53). In 1446, Laonikos’ father George was sent in an embassy to sultan Murad II (1421–51). It is documented that in 1447, Laonikos was at Mystra and studied “Latin and Greek literature” under the neo-Platonist philosopher Georgios Gemistos Plethon (1355–1454) (Cyriac of Ancona 2003). The remainder of his life remains unclear, and the short biography on Laonikos composed in the sixteenth century by the Cretan physician and scribe Antonios Kalosynas is incomplete and untrustworthy. Nevertheless, Kalosynas’ description of Laonikos’ education and skills is reliable, for he is depicted as “a man famous for his great zeal and disposition in the study of historians, orators and philosophers” (Kalosynas 1873: 243; Darkó 1923–24; Kampouroglou 1926). It is accepted that in 1453, Laonikos was not in Constantinople, and hence he did not witness the events associated with the Fall. Though it cannot be confirmed where he spent his life, his work indicates that he resided in a location that allowed him access to information and to use “Turkish informants, including secretaries” (Kaldellis 2012a). An examination of the manuscript tradition of the

Histories has led to the suggestion that Laonikos composed his work in postconquest Constantinople (Kaldellis 2012c, 2014a). There is no evidence to support Laonikos’ presence in the Aegean, in the Venetian-occupied Crete, in Italy (Nicoloudis 1996), or in a place where he would be in contact and exchange ideas with Westerner scholars (Harris 2003b). The hypothesis that he must have embarked upon several journeys that allowed him to collect information that he used in his work is plausible. There is no precise information concerning Laonikos’ death, which should be placed after 1464/8 (Kaldellis 2012a; Preiser-Kapeller 2013).

His only known work, *Histories* or *Demonstrations of Histories* (*Apodeixeis Historiōn*), covers the historical events of the period 1298–1463/4 and is divided into ten books. It begins with the emergence of the Ottomans and ends with the description of events that took place on the Greek island of Lemnos and the Peloponnese. It should be noted that his narrative lacks chronological accuracy and that posterior interpolations have been identified in the *Histories* (Kaldellis 2012c). The work, which appears to be incomplete, was probably composed between 1464 and 1468 (Kaldellis 2012a). Laonikos states the purpose of his *Histories* in the introduction, i.e., to write a history of the destruction of the Byzantine empire (*Hellenōn teleutēs*) and the Ottomans’ ascendance to power (*Tourkōn epi mega dynameōs afikomenōn*) (Chalkokondyles 1843:4; Chalkokondyles 2014: 2–3), and narrate “other events that happened throughout the world” and as he claims “not all of which occurred during my own time; some I was able to witness personally, others I describe based on the most reasonable conjecture that I have been able to form about them” (Chalkokondyles 1843:3; Chalkokondyles 2014: 3; Kaldellis 2014a) contributing, as he believes, to the exposition of the truth. Laonikos places great emphasis on the history of the expansion and rise of the Ottomans. He also discusses the history and relations of other nations and regions, as for example, Germans, Russians, Slavs, English, and Spaniards. In this regard, he follows the ethnographic and geographic tradition of Herodotos, whom he uses as the main source for these descriptions (Kaldellis 2014b).

Laonikos expresses his admiration for the ancient historian and frequently uses Herodotean phrases (Hunger 1978; Kaldellis 2014b). Herodotos' influence on the *Histories* becomes evident in terms of structure and the presentation of the material. It is possible that Laonikos' intention was to write nine books following Herodotos' *Histories*. The Herodotean imitation influenced Laonikos' decision not to use dates, which leads to chronological mistakes. His style, ideas, the emphasis placed on the description of the enemy, and the use of the pattern Hellenes-barbarians are also based on Herodotos (Markopoulos 2000). The effect of Thucydidean language and style, manifested in the use of the Attic dialect and the introduction of direct speech, permeates the text. Laonikos imitates classical syntax and uses Attic vocabulary, referring also to names and places with classicized terms, and translating Ottoman and other foreign words into Greek. The ancient Greek sources which he used for his composition are distinguished, from Herodotos and Thucydides, "Diodoros of Sicily, pseudo-Aristotle's *Meteorology IV*, some of Plutarch's essays and possibly Ptolemy's *Geography*" (Kaldellis 2012b). It is, however, difficult to identify the Ottoman and Western sources Laonikos depended upon, having only indirect knowledge of some of them. It has been confirmed that he had used Turkish oral sources and traditions, and that he had access to Ottoman official sources and knowledge of Ottoman institutions and administration (Vryonis 1976; Kaldellis 2012a). Laonikos appears to have used Byzantine sources as well, as for example, the *Roman History* of Nikephoros Gregoras, Manuel II Palaeologus's *Funeral Oration on his Brother Theodore*, and Plethon's *Corrections to Some of the Mistakes in Strabo*, though it has been recently argued that it cannot be established whether he had direct access to all these sources (Nicoloudis 1996; Kaldellis 2012b).

Innovative and Original Aspects

Laonikos may appear to have followed the Byzantine tradition of imitation of antiquity (Hunger 1978), namely because of his dependence on Herodotos, yet it is argued that as a

"new Herodotus" (Kaldellis 2014b) he deviates from the Byzantine tradition in terms of ideas and the choice of themes, and offers a perception of the world without relying on Christian or Byzantine conventions. The *Histories* do not record only the history of Byzantium, since the narration focuses on the rise and expansion of the Turks. Laonikos deals extensively with the structure and organization of the Turks, focusing on their history, the reasons of their expansion and success, praising at times individual Turks and being critical towards others. He also depicts Islam "as a decent culture rather than a religious error" (Kaldellis 2014a, b; Nicoloudis 1996). In comparison to other Byzantine historians, Laonikos does not express hatred against the enemy. He appears objective also in his description of the social and political mores of other nations and although he attributes to people some standard cultural characteristics, he often emphasizes on the strengths of the nation he presents. Therefore, his "ethnographic and geographic digressions" differentiate him from his Byzantine predecessors (Kaldellis 2014a: xii; cf. Akisik 2013).

A rupture with the Byzantine tradition is also indicated by the use of the term *Hellene* to refer to those who speak Greek and are of Greek origin, among which the Byzantines. For Laonikos, the Byzantines are Greeks and not Romans; *Romans* are the ancient Romans or the Westerners, and the Ottomans are referred to as Turks. Christian kings, Muslim rulers, and the sultan are designated as *basileus*, a term traditionally used for the Byzantine emperor, to whom Laonikos refers as *basileus Hellenōn* or *basileus Byzantiou* and not as *basileus Romeōn*, a term he uses for Western kings. Of interest is also the fact that while Byzantine rulers are described and often criticized, unlike other Byzantine works, they are not central figures in Laonikos' narrative (Harris 2003b; Kaldellis 2014a; cf. Lamers 2015).

Another element that sets Laonikos apart from his Byzantine predecessors and his contemporaries who recorded the events of the Fall of Constantinople is his notion of historical causation, and more specifically his perception of the reasons that caused the Fall in 1453. Contrary to

the Christian explanation of those who viewed the Fall as God's punishment for the sins of the Constantinopolitans, and to those who adopted the classical idea of merely fortune (*tychē*) or ill fortune, Laonikos contends that the victory of the Turks, and generally the success and rise of any people or nation, are brought about by the synthesis of *tychē* (fate or fortune) with *aretē* (virtue), while in the case that *aretē* is replaced with hubris, events take the opposite turn, leading to failure. Although a direct influence of his teacher Plethon, who has composed a short treatise *On Fate* (*Peri Heimarmenēs*) and of Herodotus and ancient Greek writers is manifested in this view, Laonikos' notion of historical reasoning is an exceptional case in Byzantine historiography (Kaldellis 2014a; Harris 2003a; De Bakker 2015). It has been suggested that Laonikos formed his views adopting ideas of ancient Latin writers, such as Livy and Cicero, which were reproduced and developed at the time of the composition of the *Histories* by humanists in Renaissance Italy, with whom Laonikos was most possibly in contact. Therefore, it has been proposed that his work, dealing extensively with the enemy and the reasons for its success, was perhaps influenced by humanist ideas about fate which are crystallized in Giovanni Pontano's (1426–1503) *De Fortuna* (*On Fortune*), Machiavelli's (1469–1527) *Il Principe* (*The Prince*), and other Renaissance works (Harris 2003a, b). In contrast to this, it is argued that Laonikos' "knowledge of the West is spotty" and the *Histories* should be perceived as a "post-Byzantine work, not a protohumanistic one" (Kaldellis 2014a).

Laonikos' willingness to present the competence of the enemy, the absence of discussion on doctrinal matters, the events of the Council of Ferrara-Florence (1438–45), and of Christian views in regards to the end of the Byzantine Empire, which are observed in the work, indicates his intention to produce a history free of biases and differentiates him from his contemporaries. In no case does Laonikos appear in favor of the Turks, neither as pro-Latin (Turner 1964: 358–361).

Impact and Legacy

Laonikos "writes as a Greek" and embraces a belief in the supremacy of Greek culture and a hope for the spread of the Greek language in the whole *oikoumenē*, alluding most probably to the increasing interest in Greek studies in the West and especially in Renaissance Italy. At the same time, Laonikos appears to be expressing his optimism about the regaining of power by the Greeks and their reunification under a Greek *basileus*. He states that "the language of the Greeks has spread to many places throughout the world and has mixed with many other languages. It is already exceedingly prestigious and will be even more so in the future, when a king who is Greek himself, along with the kings that follow after him, will rule over a substantial kingdom. There the sons of the Greeks may finally be gathered together and govern themselves according to their own customs, in a manner that is most favorable for themselves and from a position of strength with regard to other peoples" (Chalkokondyles 1843: 4–5; Chalkokondyles 2014: 3–5). It is therefore argued that Laonikos was promoting, influenced by his teacher Pletho, the idea of a Hellenic identity (Kaldellis 2014b; Lamers 2015).

The value of the work becomes evident from the large number of manuscripts of the text, as well as from the various translations and publications of the *Histories*, especially in Latin, as early as 1556, with the Greek text being for the first time published in 1615. The *Demonstrations of Histories* has been used as a source for the composition of historical works, such the *Historia Universale dell' Origine et Imperio de' Turchi* (1560) of Francesco Sansovino (1521–86), Theodore Spandounes' *On the Origin of the Ottoman Emperors* (16th c.), the anonymous' *Chronicle of the Turkish Sultans*.

Laonikos composed an original work, explored a variety of themes related to the Fall of Constantinople, and offered to Renaissance readers an account of the events and an insight on Ottoman and Byzantine history. Laonikos produced a work that contributed to an innovative

application of Herodotean and Thucydidean historiography, while being one of the earliest sources recording the history of the Ottomans. The eighteenth century scholar M. De Vigneul-Marville assesses in a few words the *Demonstrations of Histories*, stating that Laonikos “treats the history of the Turks without dishonoring the Byzantines. He has the gift of arousing our attention, by inspiring us with curiosity, and of not letting us fall asleep over his book.” (De Vigneul-Marville 1701).

Chalkokondyles, Theophilos

Born: 1486, Florence

Died: ca. 1511, Pavia

Christina Kakkoura

University of London, Royal Holloway and
Bedford New College, Surrey, UK

Abstract

Theophilos Chalkokondyles or Theophilos Tryfon Chalkokondyles or Theophilus Chalcondyles or Chalcocondyles (ca. 1486–1511) was the son of Demetrios Chalkokondyles and a disciple of the great Renaissance scholars Demetrios Chalkokondyles and Ianos Laskaris. His life and career ended unexpectedly, for he was murdered at a young age. Theophilos' only known work is a commentary on Valerius Maximus' *Memorable Deeds and Sayings*.

Biography

Theophilos was born in 1486 and was the eldest son of the teacher and scholar Demetrios Chalkokondyles (1423–1511). Demetrios married in 1484 at the age of 61 and had ten children. In an autograph manuscript, *Parisinus graecus* 2023, f. 323, Demetrios provides information about his children's names, birth dates, and godparents. (Legrand 1885a, b). Not much information exists on Theophilos' life and career. According to the account of the Renaissance humanist Piero Valeriano (1477–1558) found in his work *De litteratorum infelicitate (On the Ill Fortune of Learned Men)* (1529), "Theophilos was outstanding in ability and learning and . . . the source of great hope" for his father (Valeriano 1999). Theophilos studied Greek and Latin, first under his father and later under Ianos Laskaris (ca. 1445–1534), who was his patron for several years. Theophilos' description as a learned and competent young man is confirmed by his brother-in-law, Aulus Janus Parrhasius (1470–1522), who

mentions that young Theophilos was almost "equal to his father" in learning (Parrhasius 1567; Legrand 1885b). While Theophilos was in Pavia, where he continued his studies after leaving Laskaris, he was murdered. Piero Valeriano (1477–1558) states that "he was killed by those who envied another man's talent" (Valeriano 1999). Paolo Giovio (ca. 1486–1552), a contemporary biographer, portrayed Theophilos as having mercurial personality that was responsible for his assassination (Giovio 1577). Giovios' description is viewed as unreliable by modern scholars (Legrand 1885b; Cammelli 1954). According to Giovio, Demetrios never learned about the assassination of his son, since his wife had kept it secret from him. This information is not consistent with that of Valeriano, who notes that Theophilos was the cause of his father's "bitter sorrow" (Valeriano 1999), alluding most possibly to the grief caused to the father by the youth's death, which occurred probably in 1511.

Aside from the fact that Theophilos was taught by his father and Ianos Laskaris and that he studied in Pavia, there is no detailed information about his education, teaching, and scholarly activities. Paolo Giovio records that Theophilos taught Homer during his stay in Pavia (Giovio 1577). He produced a commentary on the *Facta et Dicta Memorabilia (Memorable Deeds and Sayings)* of the Roman historian Valerius Maximus, a work that was extensively used in university curricula during the Renaissance. Theophilos' commentary was first printed in Milan sometime around 1508 and was reprinted several times (Crab 2013). The commentary indicates that he was adept in the Greek and Latin language, well acquainted with classical authors and various genres, as for example, historiography, poetry, and philosophy. He was particularly interested in geography and had good knowledge of contemporary works produced by Italian humanists.

Theophilos' commentary on Valerius Maximus is exceptional among those produced in his time; while it reflects the practice of Renaissance humanists to produce commentaries on classical authors that could be used by students, it does not follow the convention of systematic interpretation of the ancient sources. Theophilos'

commentary, though depending to a great extent upon the comments produced by the humanist, teacher, and textual editor Aulus Janus Parrhasius (1470–1522), differs from the works of other commentators namely in terms of methodology, given that he provides unsystematic comments of various length on the entire work, focusing on certain matters while disregarding others. Most probably Theophilus' aim was to "correct and improve the text of the *Memorable Deeds and Sayings*" (Crab 2013) and thus offer a critical assessment of the text that would be beneficial for private study.

Chambre, Marin Cureau de la

Born: 1594, Saint-Jean-d'Asse

Died: 29 December 1669, Paris

Simone Guidi

Sapienza Università di Roma, Rome, Italy

Abstract

He was a French physician and natural philosopher, a member of the *Académie française*, and one of the founders of the *Académie des sciences*. He is known for his reinterpretation, from a metaphysical and physiological point of view, of pneumatology, on which he founded his theses on psychology, optics, and physiognomics. His thought attempted a mediation between scholastic conceptualism and the science of physics that was taking off at that time, sometimes also using elements originating in Renaissance Neoplatonism.

Biography

He was born in Saint-Jean-d'Asse in 1594 and died in Paris on 29 December 1669. He studied medicine in Montpellier and later practiced in Le Mans. In 1634 he became the personal doctor to the Chancellor Pierre Seguier, enjoying his protection. He later became Louis XIV's personal

doctor and then in 1635 a member of the *Académie française* initiated by Richelieu. In 1666 he was one of the founders of the *Académie des sciences*. La Chambre was one of the seventeenth century's most distinguished doctors and natural philosophers. His output includes, among other works, the five-volume *Les caractères des passions* (1640–1662), the ambitious essay *L'Art de connaître les hommes* (1659), and its follow-up, the *Système de l'âme* (1664b), works that were highly considered at the time.

Heritage and Rupture with the Tradition

Pneumatology, Physiognomics, and Anthropology

The most original element in La Chambre's work is a theory of spirits (Darmon 1985) that shows the obvious influence of pneumatology (especially Jean Fernel's) deriving from Galen and Hippocrates, but at the same time, it finds mediation through the mechanistic thinking that was beginning to take hold, and it represents in some ways the connecting theme that holds together all his work. The "spirit" is understood by La Chambre as a being with an intermediate status between material and immaterial substances, or between the embodied and the disembodied, characterized by extreme volatility, mobility, warmth, and brightness, and that allows the French doctor to set up a philosophical system equidistant between animism and materialistic mechanism (Darmon 1985; Burgio 2005; Wild 2008). From an ontological point of view, then, La Chambre does not seem to think of his notion of "spirit" as contrasting, as it does in Descartes, with the Ficinian and Augustinian tradition (Burgio 2005) that flourished throughout the seventeenth century, in spite of the fact that this author seems to alter his position a few times over the years, shifting between a doctrine that has spirits actually coming out of people and one that considers spirits in a more classical sense as an active force that conveys the appetites and manages the body's inner working processes (Darmon 1985; Burgio 2005).

An application of his theory of spirits in Cureau's later work is to be found in his most substantial text, *Les caractères des passions*, an

essay on physiognomics and psychology in five books, in which the French doctor, on the basis of an earlier attempt in *Nouvelles pensées sur le causes de l'amour d'inclination* (Burgio 2005), describes spirits as the fundamental medium between the soul and the humors. Spirits allow La Chambre to think of the passions of the soul as states of the soul and the body at the same time, as if the two entities amounted to one: the emotions of the soul cause movements of the spirits, which are the soul's instruments, and these movements in turn cause an ebbing and flowing of blood and humors, which give us the expressions we read on the body. Based on this scheme Cureau describes and analyzes every human passion. It should also be noted that by bringing in spirits as the intermediaries between the mind and the body, La Chambre is also able to avoid falling into materialism but without having to do without a moderate form of mind-body ontological dualism.

Gnoseology

La Chambre's ideas in the theory of knowledge are centered on a concept of "image" (Darmon 1985; Burgio 2005; Wild 2008) that turns out to be not far removed from that theory of the spirit that is in turn the foundation of his theory of "immaterial bodies," which Cureau developed in his studies of optics (Cureau de la Chambre 1634, 1657, 1650). The French doctor held that knowing is an action carried out by the intellect on the representations produced by the imagination, but at the same time, it must be understood as an operation that, while always mediated through material representations, is of an active and spiritual nature. The soul, which can "read off" sensory representations but can also create them, does not distinguish inside itself between an agent intellect and a possible one (Cureau de la Chambre 1664b). The notion of "image" makes it possible to think of the spiritual representations of the intellect and the material ones of the imagination as opposite from the ontological point of view, although able to ensure an operative continuity (Darmon 1985; Wild 2008). Cureau's ideas in the philosophy of mind also extend to a consideration of animal cognition, in relation to the debate between Chanut, Charron, and Montaigne (Marcialis 1982; Scribano 2010). Partly

taking up Platonistic innatism, Cureau puts forward a theory of mental images according to which animals have all their actions determined for them from birth by figures impressed on their imaginations. Animal thinking is therefore only sensory, attending only to particularities, without any universal concepts, since it arises from imagination, not intellect. Thus, without moving too far from Aristotle, Cureau manages to find room for Platonistic innatism, allowing in animals for a stock of innate notions for the imagination to draw on in the memory. This, however, is not able to operate by itself, but needs powers of reasoning, though inferior to human ones, by which animals can reach practical judgments, though not actual deliberations of the will (Scribano 2010). By attributing to animals this “weak” form of reasoning, Cureau goes as far as to credit them with an imperfect but genuine use of language, as well as the habit of communicating practical thoughts and indications to each other Cureau de la Chambre (1647).

Champaignac, Jean de

Born: unknown (15th century?)

Died: unknown (16th century?)

Violaine Giacomotto-Charra
Université Bordeaux Montaigne, UFR
Humanités, Pessac, France

Abstract

Jean de Champaignac was one of a number of erudite magistrates who, in the late sixteenth and early seventeenth century, undertook the popularization of Aristotelian philosophy for

an elite readership unwilling to read in Latin. While his ideas were not the most original (his work is mainly compilation), he is the author of the first French *Physique* and *Sommaire des Quatre Parties de la Philosophie*, bringing together the four branches of Scholastic philosophy.

Alternate Names

Champeynac

Biography

Very little is known of the life of Jean de Champaignac, as almost no archive research has been carried out into the subject. What is known for sure are the dates of publication of his works and their titles – his first texts, *La Physique Françoise* and *Traité de l'Immortalité de l'Ame*, were published in 1595. At this time, he was a lawyer with the Parliament of Bordeaux and held a position as Master of Requests for “Madame la Princesse, sœur unique du Roy” (Madame la Princesse, only sister to the King), Margaret of Valois. One deduces from this that he was born some 25 or 30 years prior to this date. In 1607, when his *Sommaire des Quatre Parties de la Philosophie* was published, he presented himself as Equerry, sieur Dumas, Councilor to the King, Lieutenant assesseur at the Présidial tribunal of Périgueux. He was still officiating as Margaret of Valois’s Master of Requests. The *Sommaire* was reedited in both 1607 and 1610. After this, all editorial trace of Champaignac is lost for good.

Works

The work of Jean de Champaignac has the merit of being the first attempt on the part of a Jurist at penning a synthesis of Scholastic philosophy in French. This project, which only came to fruition in 1606, is explicitly mentioned in the preface to

La Physique in 1595. Before Champaignac, the reader could turn only to the *Œuvres de Philosophie, à Sçavoir Dialectique, Phisique, et Ethique d'Aristote Reduictz en Epitome* (1583), a concise manual produced by Noël Taillepied, a schoolmaster, intended for educational purposes.

Champaignac’s project targeted an entirely different readership. In the preface to the *Physique*, Champaignac leaves the linguistic dimension aside, although he does introduce a number of elements borrowed from Scholastic Latin. He describes himself rather as a man who, however committed to his work as a magistrate, does not neglect “good sciences,” even if he lacks the time and energy they might merit – “un vray courtisan [...] qui ne peut vouïer tout son esprit à un project” (a true courtier [...] who may not devote his spirit entirely to a single project). This translates Champaignac’s desire to educate the kingdom’s elite in a comprehensive, swift, and efficient way. The identity of the dedicatees of his texts is also worthy of note. *La Physique* and the *Traité de l'Immortalité de l'Ame* are dedicated to a woman, Jacquette de Montbron, a member of the new female elite. She was born into a noble family from southwest France, was well educated, and was a cousin of Brantôme. The *Sommaire* is dedicated to Margaret of Valois. Champaignac’s work, before that even of Dupleix and Bouju, thus marks an important stage in the development and popularization of philosophy.

Only the two treatises on physics are fully developed works. Champaignac completed his initial project in order to publish the *Sommaire*, but in doing so cut his subject matter short. In terms of content, his *Physique* and *Traité de l'Immortalité de l'Ame* are lacking in originality – they set forward Aristotelian doctrine as it was taught at the arts faculty, firmly rooted in the Thomistic tradition (particularly the *Traité de l'Immortalité de l'Ame*), but delving also into a number of available manuals in Latin and clearly Christianized (see, e.g., the chapter establishing that the world was created, a fact which could be proven through reason). Like other manuals aiming to provide swift and comprehensive edification, Aristotle’s text is

elaborated upon in a number of areas. Champaignac takes his inspiration from the model of the “*Tractatus de sphaera*” to develop his explanation of astronomy.

One passage from his treatise on the soul is celebrated for its critique of the hypothesis of animal intelligence, in response to Montaigne’s position.

Charron, Pierre

Born: 1541-Paris

Died: 16 November 1603

Maria Elena Severini

Istituto Nazionale di Studi sul Rinascimento,
Florence, Italy

Abstract

Pierre Charron made an important contribution to French sixteenth-century thought, partly because of his controversial skepticism. His *Traité de la sagesse* enjoyed extraordinary popularity, especially in the circles of the erudite libertines of the first half of the seventeenth century, who championed its skeptical aspects and the criticism of prejudice. Charron’s skepticism takes the form of an acute criticism of all dogmatism and philosophical and religious fanaticism.

Biography

The son of a bookseller, he graduated in law at Bourges and was ordained priest in 1576. A fervent Catholic theologian, he made an important contribution to French sixteenth-century thought, partly because of his controversial skepticism. He was greatly esteemed as a preacher by Margaret of France, Queen of Navarre, and also enjoyed the favor of King Henry IV. He worked intensively as a theological consultant in various dioceses (Agen, Cahors, Condom, and Bordeaux). After 1589, the year in which he met Michel de Montaigne whose friend and disciple he became, he tried in vain to withdraw to a life of seclusion in a monastery. It was from Montaigne that he learned the skepticism which emerged in his two principal works, *Les trois vérités* (1593) and *Traité de la sagesse* (1601). These bring together polemic against the rational theology of the scholastics and a message of tolerance, procuring him an accusation of atheism. The

Jesuit François Garasse defined the treatise “a breviary for free thinkers” and dubbed its author a “closet atheist”; Charron was energetically defended by the bishop of Boulogne, Claude Dormy, and other influential churchmen. Condemned by the religious and civil authorities and then reprinted in an amended edition in 1604, the *Traité de la sagesse* enjoyed extraordinary popularity, especially in the circles of the erudite libertines of the first half of the seventeenth century, who championed its skeptical aspects and the criticism of prejudice. Charron’s skepticism takes the form of an acute criticism of all dogmatism and philosophical and religious fanaticism and a strenuous upholding of the autonomy of the *esprit fort* in its interior liberty in contrast to the passive mores of the majority (the *esprits faibles*).

Charron died of a stroke in a street in Paris, where he was supervising the reprinting of his treatise *De la sagesse*.

In his other works – *Les trois vérités* (1593) and above all the *Discours chrétiens* (1604) – Charron defined a concept of the moral independence of religion founded on Renaissance naturalistic notions, paving the way to secular thought. He makes a clear distinction between religion and morality: reason must waive its metaphysical claims, accepting the religious truths by faith, and must carve out a place in the world in which it is sovereign and free. For Charron, true wisdom lies in acting, irrespective of one’s religious creed, according to the laws of nature and according to the rational and universal principles that spring from these. True moral behavior has its foundation in itself, that is, in the very exercise of virtue and not in an ethic servile to a religion which instils fear. The wise man is distinguished by an ethic that is free of reward, which he must arrive at within himself without seeking to impose it on other people.

The result is a natural rational morality, free of otherworldly rewards or punishments, aimed at spirits capable of exercising skeptical doubt against dogmatism and blind obedience to fanaticism and superstition. Hence, reason must never be dogmatic, but must rather free itself of prejudices and restrict itself to knowledge only of human issues, without pointlessly posing itself

metaphysical questions to which it cannot give any certain answer. Charron exhorts us not to get mixed up in discussions about the religious truths: instead, we must believe by faith and by virtue of tradition. He is fiercely critical of the dogmatic fideism that claims to possess an absolute knowledge and code of values. This is what gives rise to the human bestiality of imposing one’s opinions on others by every possible means. A fundamental feature of Charron’s work is the apologia of doubt, which is what renders the wise man free. Precisely because he knows that no research can be definitive or exhaustive, the wise man never stops using and exercising his reason: it is this that makes him the image of God on earth.

Philosophy, The Czech Academy of Sciences,
Prague, Czech Republic

Abstract

Petr Chelčický was a Czech medieval thinker who became famous primarily due to his rejection of all physical forms of violence and also his criticism of the contemporary society and most importantly its division into three states.

Biography

Until recently, historians considered the date of birth of Petr Chelčický to be approximately

around 1390. Currently, researchers are coming to the opinion that this Czech philosopher and theologian probably more likely was born around 1380. We are able to reconstruct the biography of Chelčický only partially. The most certain chronology can be gathered from his treatises, some of which can be reliably dated. Furthermore, we have at our disposal a few allusions to Chelčický's character, which were written by his contemporaries in their works. Finally, we do not even have reliable information about Chelčický's death. Another item of significance is the hypothesis which states that the name Petr Chelčický is only a pseudonym of the Czech yeoman Petr Záhorka from Záhoreč (near Strakonice in Bohemia, now Czech Republic). It can be said with a high degree of probability that Chelčický was a layman, a member of the lower aristocracy, and according to what we know did not attend university (evidence of this is his limited knowledge of Latin).

Innovative and Original Aspects

The most significant feature of the considerably original teaching of Petr Chelčický was his almost unconditional rejection of all forms of violence. This question is addressed in his first (preserved) writings, *O boji duchovním* (On Spiritual Warfare). In his argumentation, he relies primarily on theological reasoning. He cites, first of all, the *Commandments*, and then various passages of the *New Testament*.

Chelčický is also well known for his criticism of the contemporary society. In his contemplations, he proceeds as a matter of principle from comparing the current state of society with the state demanded by the *New Testament*. In his writings *O trojím lidu řeč* (On the Triple Division of Society) and *O církvi svaté* (On the Holy Church), he arrives at the very harsh criticism of the power and property conditions prevailing in society at that time. The most space in his critical contemplations is focused on his rejection of the worldly powers of the church. A result of his criticism is finally a radical attack on the division of society into three states. Chelčický rejects the

idea that *one fights, the second prays, and the third works*. God, according to Chelčický, did not form a king, a magistrate, a town councilor, or a judge and executioner.

Impact and Legacy

Even though Petr Chelčický was not the founder of the new Czech church, the Unity of the Brethren, he is historically considered to be its spiritual father. It was under the influence of his treatises that the new religious groupings in the years 1467 and 1468 were founded by Řehoř Krajčí (died 1474).

Historically, the possible influence of Chelčický can be seen on the later irenicism of Jan Amos Komenský (Comenius; 1592–1670). Regarding this matter, it is obviously necessary to remember the different roots of the attitudes of Chelčický and Komenský and stress that Komenský in his rejection of violence arrived at this through his own and original journey.

The legacy of Petr Chelčický had a great influence among others on L. N. Tolstoy and his attitude to faith and his rejection of all forms of violence.

Chemistry in Renaissance Sciences

Matteo Martelli

Humboldt Universität zu Berlin, Berlin, Germany

Abstract

The recent historiography of alchemy clearly marked a substantial shift away from the view held by earlier historians of science, who tended to dismiss the discipline as a pseudoscience that played no role in the so-called Scientific Revolution. No longer considered as a kind of mystic or spiritual science (as eighteenth- and nineteenth-century occultists and psychologists

wanted to interpret it; Principe 2013, 94–106), alchemy is now studied as a complex set of theories and laboratory practices aimed at manipulating natural substances and producing artificial products, which we would nowadays call chemical. Until the beginning of the eighteenth century it is impossible to draw a clear-cut distinction between alchemy and chemistry without retrospectively applying modern categories and definitions. At the end of the fifteenth century, Humanists introduced the terms *chymia*, *chymicus*, or *chymista* (“chemistry,” “chemical,” or “chemist”). Although this new vocabulary was sometimes interpreted as evidence for the existence of two distinct areas of expertise (namely chemistry and alchemy), it is now clear that the abovementioned terms were used as synonyms of “alchemy,” “alchemical,” and “alchemist.” Both *alchymia* and *chymia* referred to the same discipline mainly concerned with metallic transmutation and the production of medicines. In order to avoid any anachronism, scholars have recently introduced the term “chymistry” in reference to these activities from the late fifteenth to the end of the seventeenth centuries (Newman and Principe 1998). The rise of Paracelsianism and the debate that it generated greatly contributed to reshape late medieval alchemical theories and practices. New chymists reworked Paracelsian elements and combined them with the teaching of thirteenth- and fourteenth-century alchemists (such as ps.-Geber, ps.-Lull, ps.-Arnald of Villanova), thus contributing to lay the foundation of eighteenth-century academic chemistry.

Synonyms

Alchemy; Chymistry

Problems of Vocabulary: “Alchemy” and “Chemistry” as Synonyms

The terms “alchemy” and “chemistry” share a common etymology, since both stem from the Greek *chym(e)ia/chēm(e)ia* [χυμ(ε)ία/ χημ(ε)ία;

Halleux 1979, 45–46], which occur in late antique and Byzantine authors in reference to a wide array of technical skills. While the lexicon *Souda* (tenth century) defines *chēmēia* as “the preparation of gold and silver,” Byzantine alchemical collections mention a *chymeutikē biblos* (χυμευτική βίβλος, “alchemical book”) that instructed on how to make gold and silver, how to solidify mercury, how to produce artificial gemstones, pearls, and colors, and how to dye leather purple (Berthelot and Ruelle 1888–1889, vol. 2, 220). When Greek alchemical treatises were translated into Arabic, the Greek term was transliterated (through a Syriac intermediary) as *kīmiyā*’, to which the Arabic article *al-* was prefixed. The Latin terms *alkimia*, *alchymia*, *alchemia* are instances of the different attempts to render the Arabic *al-kīmiyā*’, as attested in twelfth-century Western translations of astrological (e.g., Hugo of Santalla’s translation of ‘Umar’s *Book of Questions*, see Burnett 1992) and alchemical Arabic treatises (e.g., Robert of Chester’s *De compositione alchemiae*, the translation of an alchemical text attributed to the Umayyad prince Ḥalīd b. Yazīd). The Latin *alchymia* (along with its orthographic variants) became common in the thirteenth and fourteenth centuries and was even transliterated into Greek (e.g., ἀρχημία or ἀρχμία) in late Byzantine texts, such as the alchemical section of MS *Parisinus gr.* 2419 (fifteenth century), which preserves a Greek translation of Albert the Great’s *Semita recta* and a collection of recipes translated from Latin (Colinet 2010, xiv–xvii).

Later on, the form *chymia* was rediscovered and reintroduced by Humanists, who were intrigued by the etymology of the term *alchymia*. In his commentary on Dionysius of Halicarnassus (Lehnerdt 1890, 10–12), John Kanaboutzes (mid-fifteenth century) preferred the term *chymia* (χυμία) to the Latin *archymia* (ἀρκυμία) in his description of alchemy, which included methods for transmuting base metals into gold and silver, dyeing stones, and producing artificial pearls. In his interpretation, the term *chymia* stems from the Greek verb *cheō* (χέω, “to pour”), since the alchemical art teaches how to dissolve metals (Sakorrafou and Merianos 2014). According to

Francesco Filelfo (1398–1481), the correct name of *alchemia* was *chalchimia* (attested also in the early modern editions of Nicholas of Cusa's works; see Matton 1995, 293–295): in a letter of 1471 he explained *chalchimia* as the art of corrupting copper, from the Greek *chalkos* (χαλκός, “copper”) and *miainō* (μιάινω, “to stain”; see Williams 2003, 335–336). The Humanist Ermolao Barbaro (1454–1493) surely knew the lexicon *Souda* and the Byzantine alchemical writings collected in the famous MS *Marcianus gr.* 299 (tenth to eleventh century), belonging to Bessarion's library. In his *Castigationes pliniana*e (1492) he criticized *chymistae* (i.e., “alchemists”), who adulterate metals: their name, Barbaro argued, stems either from the verb *fundo* (“to melt”; χέω in Greek) or from the term *succus* (“juice,” χυμός in Greek). The same terminology occurs in Pandolfo Collenuccio's *Agenoria* (1497), where *chymistae species* are mentioned among the useless Greek “sciences” (Matton 1995). At the beginning of book 2 of *De auro libri tres* (ca. 1515; published in 1586), Gianfrancesco Pico della Mirandola (1469–1533) refers back to Barbaro's explanation and clarifies that the correct name for the art that transmutes metals is *chemia* rather than *alchimia*, an Arabic term adopted by many Latin writers. Keen on Greek terminology, he further specifies that Greeks used to refer to gold-making as *chrysopoeia* and to silver-making as *argyropoeia*.

This “Greek” vocabulary was widely adopted by sixteenth-century scholars and alchemists. Giovanni Aurelio Augurello (ca. 1456–1524) gave the title of *chrysopoeia* to his influential alchemical poem. Giovanni Agostino Panteo (mid-sixteenth century) defined his new cabalistic alchemy, called *vorachadumia*, in contrast with the traditional alchemy (in his view, the art of adulterating metals), which was referred to as *alchimia*, *chemia*, or *calcimia*. Among the Renaissance commentators of Aristotle's *Meteorology*, Agostino Nifo (ca. 1469–1538) denied the possibility of metallic transmutation advocated by the experts in *alchimia*, a vulgar name that he proposed to replace with *ars fusoria* (“melting art,” from the Greek χέω, “to melt”; Martin 2004,

252–253). In his books on mining and metallurgy, Georgius Agricola (1494–1555) speaks of *ars chymiae* in reference to alchemy, and the Latin translators of Paracelsus' treatises used *chemia* to translate the German *Alchimei*, namely the art of *Alchimisten* (Rocke 1985). Moreover, Paracelsus introduced the neologism *spagyria* (a term later interpreted as stemming from the Greek verbs σπάω, “to draw out,” and ἀγείρω, “to bring together”) to emphasize the centrality of *Scheidung*, that is, the separation of the three principles that compose every substance (sulfur, mercury, and salt). In his view the term better explained the basic processes of a medically oriented alchemy, whose aim was to isolate the three principles, which were purified and then recombined to produce effective drugs. Paracelsians usually referred to this medical domain of alchemy as *chemiatria* or *iatrochemia* (both stemming from *chēmia* and the Greek term ἰατρός, “physician”; Schneider 1972).

The terms *alchemia* (or *alchymia*) and *chemia* (or *chymia*) continued being used as synonyms until the end of the seventeenth century, as well exemplified by the title *Theatrum chemicum* given to the impressive collection of alchemical treatises, which included both medieval and Renaissance writings (six vols, 1602–1661). Andreas Libavius (ca. 1555–1616) interpreted Paracelsus' *spagyria* in the light of Aristotle's *Metereology* and defined it as the art of *synkresis* (“association”) and *diakresis* (“dissociation”), two terms used by Aristotle to describe Democritus' atomism (Newman 2006, 66–81). Through these operations it was possible to reach the two main goals of alchemy (called either *alchemia* or *chemia*), namely metallic transmutation and the preparation of medicines. He also introduced the neologism *chymeion* (χυμείον) to refer to the equipped chemical workshop (*laboratium chymicum*), where alchemists performed their work. Likewise, seventeenth-century authors of chymical textbooks did not distinguish between *alchemia* and *chemia* and the practices these terms encompassed. For instance, in his *Tyrocinium chymicum* (1612; it was reprinted more than 40 times in the seventeenth century) Jean Beguin

listed *chemia*, *alchemy*, and *spagiria* as synonyms. He accounted for the Greek origin of *chemia* and the Arabic origin of *alchemy*, yet he was mistaken (alike other contemporary authors) in interpreting the Arabic article *al* as an emphatic prefix (Newman and Principe 1998).

Chymistry Between Metallic Transmutation and Spagyric Medicines

A learned interest in the etymology of the Graeco-Arabic word *alchemy* led Humanists to reintroduce the “original” form *chemia*, which was used by no means to distinguish a different (or new) scientific and technological field somehow closer to modern chemistry. Early modern chymistry was a complex and diversified field: while it would be a historiographical mistake to look retrospectively into it and take just those elements that resemble modern chemistry out of their context, historians of science have more and more convincingly proved that the development of modern academic chemistry is deeply rooted in medieval and early modern alchemical practices and theories.

One fundamental step toward the definition of modern chemistry was the disappearance of metallic transmutation, which became an old-fashioned relic of the past in the eighteenth century. *Chrysopoeia* was not just denied within a broader philosophical debate on art and nature (such as in the medieval *quaestio de alchimia*; Newman 2004, 34–114), but it was rejected as something fraudulent and immoral (Principe 2013, 84–89). Within a quite different cultural milieu, some Renaissance scholars and artists already tried to remove *chrysopoeia* (strictly intertwined with the quest for the philosophers’ stone) from the wide array of chymical operations discovered by alchemists. In his notebooks Leonardo da Vinci (1452–1519) refused the claim of alchemists, who pretended to replicate or even perfect natural products, yet praises their useful inventions. Likewise, in his manual on metalworking *De la pirotechnia* (1540) the Italian engineer Vanoccio Biringuccio (ca. 1480–1539)

denied the possibility of transmuting metals. He first criticized the sophistic and unnatural alchemy practised by those who were impious in their attempts to counterfeit natural products; then he praised the practitioners of a “good” alchemy, who, despite their vain efforts to make gold, greatly contributed to the discovery of very valuable technologies, such as the production of metallic alloys and colors, cementation, glass-making, and distillation (Newman 2004, 120–132; Bernardoni 2014).

The epistemological status of these arts and their relation with alchemy remained quite fluid, as one can see from the different classifications of *artes* proposed by Renaissance scholars. The great contribution that alchemy gave to different technologies (metalworking, distillation, glass-making, production of medicines) was certainly acknowledged; however, these technologies were sometimes classified as separate arts, such as in the small encyclopedia *Specchio di scientia universale* (1564) by Leonardo Fioravanti (Mandosio 1993). Fragmented pieces of theories and practices taken from alchemists were shared by craftsmen and experts in different fields. In the early 1530s, a group of craft manuals known as *Kunstbüchlein* was printed in Germany. The first 50-page booklet was entitled *Rechter Gebrauch d’Alchimei* (*The proper use of alchemy*); although based on an alchemical treatise by Petrus Kertzenmacher, it did not include either Kertzenmacher’s theoretical discussions on alchemy or his recipes on metallic transmutation, yet focused just on recipes for making artificial gemstones and metalworking procedures, which could be particularly useful for craftsmen (Eamon 1996, 113–116).

Metallic transmutation remained, however, a fundamental topic in sixteenth- and seventeenth-century Europe (Nummendal 2007). For instance, at the court of Cosimo I de’ Medici (1519–1574) all the applications of alchemy, including *chrysopoeia*, were studied and put into practice in the *Fonderia* (“workshop/laboratory”) of Palazzo Vecchio. The duke asked Benedetto Varchi to compose his *Si l’archimia è vera o no quistione* (1544), where Varchi, alike Biringuccio,

praised the true alchemy (*alchimia vera*), which led to hundreds of useful discoveries: metallic alloys, medicines, colors, artillery, glass, and many other chemical compounds and instruments (Perifano 1997). All these different arts continued being practiced in the Casino of San Marco, where Francesco I de Medici (1541–1587) set a new laboratory, or in the *Fonderia* of the Uffizi Gallery (Beretta 2014). *Chrysopoeia* was discussed and practiced by the authors of seventeenth-century chymical textbooks (a tradition inaugurated by Libavius' *Alchemia*), which greatly contributed to the reorganizing of this impressive body of knowledge (Hannaway 1975). By combining a deep understanding of medieval alchemy and Aristotelian philosophy with a strong emphasis on laboratory work, Libavius was successful in composing a handbook that clearly explained the main chymical procedures (both metallic transmutation and the preparation of chymical medicines) for academic purposes (Moran 2007). The academic identity of chymistry was reinforced by the seventeenth-century textbook tradition, which brought Paracelsian and alchemical methods and theories to a new audience, namely those who attended French Paracelsians' lectures or the students of the physicians who were appointed professors of iatrochemistry in North-European universities.

Although these textbooks were mainly devoted to the preparation of new spagyric pharmaceuticals, they also included more theoretical parts discussing Paracelsus' principles and Aristotelian elements. Their authors tried to match these principles with the results of analytic practices performed in the laboratory. Joseph Du Chesne's theory of the five principles (water, mercury, sulfur, salt, earth), for instance, was endorsed by the Parisian teacher Étienne De Clave, who identified these principles with five classes of distillation products (Kim 2003, 17–63; Clericuzio 2006). Analytic and synthetic operations were already at the basis of medieval alchemy (e.g., in ps.-Geber's *Summa perfectionis*) and fire distillation became quite popular in the framework of Paracelsian spagyric alchemy, which emphasized *Scheidung* procedures to analyze substances into their main constituents. Beyond the French tradition, the mid-sixteenth-century Prussian iatrochemist

Alexander von Suchten (1520–1575) described his laboratory techniques to assay the alchemical metals produced by combining antimony compounds with other substances (e.g., silver and mercury; a method inherited by the alchemist Starkey): he dissolved these metals in mineral acids and weighted the products after distilling them. Fire analysis became a sensitive subject discussed by early modern chymists and physicians: the Heidelberg professor of medicine Thomas Erastus (1524–1583) stressed that fire does not analyze the substances into their components, but rather transforms them into new products. Within this debate Jan Baptist van Helmont (1580–1644) emphasized the role of solution analysis and introduced the concept of mass balance: scholars have convincingly shown how his emphasis on analysis and synthesis influenced Boyle's works and even Lavoisier's chemistry (Newman and Principe 2002; Debus 1967).

Moreover, laboratory procedures of analysis and synthesis were used to test and support the different conceptions of principles and elements, which were endorsed by early modern chymists (Klein and Ragland 2014). The legacy of alchemical corpuscular theories, as emerging in ps.-Geber's influential work *Summa perfectionis*, and the revival of classical atomism led chymists (such as Sennert, Billich, Saba) to introduce corporeal elements and principles in their theories of matter (Clericuzio 2000; Klein 2014). William Davidson (ca. 1593–1669), teacher of iatrochemistry at the Jardin du Roi, identified the ultimate constituents of bodies with atoms, identified as the basic components both of Paracelsian principles and of Aristotelian elements (Clericuzio 2006). Daniel Sennert (1572–1637), professor of medicine at the University of Wittenberg, used solution analysis to break up metals into their main components, namely, corporeal corpuscles. His theories and practices paved the way for the development of Robert Boyle's corpuscular theories (Newman 2006, 157–190).

Cherbury, Herbert of

Born: 1583

Died: 1648

Charles E. Snyder

Maimonides Centre for Advanced Studies,
Universität Hamburg, Hamburg, Germany

Abstract

Edward Herbert of Cherbury (1583–1648) was a diplomat, soldier, writer, and philosopher. He is considered one of the earliest

advocates of English deism. His most important philosophical treatise is his *De veritate, Prout distinguitur a Revelatione, a Verisimili, a Possibili, et a Falso* (1624). In *De veritate*, Hebert of Cherbury presents his faculty-based epistemology and defends common notions that are the rational foundation for his deism. Hebert of Cherbury writings exercised an influence on a wide range of early modern philosophers, including Grotius, Casaubon, Gassendi, Bacon, Descartes, Locke, and some of the Cambridge Platonists.

Biography

Edward Herbert of Cherbury was born in Eyton on Severn in Shropshire in 1583. He was born into a wealthy and political family. His father, Richard, was a justice of the peace and a parliamentarian. The poet John Donne served as a tutor for the Herbert children. In 1596, Herbert of Cherbury matriculated at University College, Oxford, and he remained there until 1600 when he moved to London. His education was interrupted by the death of his father and his marriage at the age of fifteen. Herbert was a soldier and a diplomat, and for many years, he divided his time between the royal courts of England and the continent. In 1603, he was made a Knight of Bath by King James I. In 1608 he moved to Paris, where he encountered many leading intellectuals of his day. His life as a soldier took him across the continent. In 1618, King James I appointed him as ambassador to Paris, a position that he held until he was recalled to England in 1624. For his service, he was awarded an Irish peerage, and in 1629, he received his title as the first Baron of Cherbury. In 1632, he was appointed to the Council of War. From the mid-1630s to his death in London in 1633, Herbert of Cherbury was involved in sundry controversies between the king and parliament and his political career languished. The

year before his death he travelled to France to meet with Pierre Gassendi.

Heritage and Rupture with Tradition

In many ways, the philosophy of Edward Herbert of Cherbury – his criticism of Scholasticism, the search for a new philosophical method, and his focus on epistemology and the mind – is representative of the early modern period. In other respects, however, Herbert articulates positions that are largely idiosyncratic in the landscape of early modern thought. Like Frances Bacon and Rene Descartes, Herbert is a harsh critic of Scholasticism. Similarly, he rejects his formal education in search for a more effective philosophical method.

Herbert's most significant philosophical treatise is his *De veritate, Prout distinguitur a Revelatione, a Verisimili, a Possibili, et a Falso*. The treatise circulated among philosophers in manuscript form until he published it in print in Paris in 1624 at the urging of Hugo Grotius. *De veritate* is ambitious and wide-ranging that primarily examines epistemological questions about truth, falsehood, and method. At the same time, he articulates his metaphysical assumptions about the nature of the mind and world. In *De veritate*, Herbert examines the nature of truth, its conditions, falsehood, and method. This treatise also presents a faculty-based philosophy of mind. Herbert grounds his view in the overarching harmony that exists between the mind and nature, a harmony that is ultimately grounded in the divine. *De veritate* also articulates many of the foundational positions of English deism, and he argues that the intellect possesses common notions, or natural instincts, for which there is common assent among all humankind. The existence of God and other theological positions are among the common notions. Herbert is also the author of posthumous *De religione gentilium*, a treatise on comparative religion in which he expands upon the common notions of the *De veritate*. In addition to philosophy, Herbert also wrote poetry, literature, and history.

Innovative and Original Aspects

In *De veritate*, Herbert defends a faculty-based philosophy of mind. Faculties are special powers of the mind that operate when a corresponding object is present. He argues that the mind is always active and never passive. Objects do not, strictly speaking, act on the mind, rather the right faculties are brought into operation when the corresponding object is present. There are countless faculties needed for the mind to know and appreciate all of nature. Herbert argues that there are distinct mental faculties that correspond not only to the generic natures of things that abound in our world, but also to the myriad and specific differences to be found in each of them individually.

Truth, according to Herbert, is a harmony that exists between objects and the mind's corresponding faculties. Truths are not limited, however, to our understanding of the natural world; the intellect has a domain of truths uniquely its own, and that do not depend on faculties associated with external objects. Herbert enumerates four kinds of truth: truth of the thing, appearance, concept, and intellect. Herbert views these four kinds of truth as a hierarchy that begins with things and ascends to the intellect. According to Herbert, error results from a faulty connection between faculty and object. Underpinning Cherbury's account of truth is the assumption of a mind-object harmony between the mind and nature, or between the mind's faculties and objects. There is a further harmony between the human mind and God. Herbert describes truth as a light that is diffused the further it travels from its source, namely, God. The mind itself, he argues, is the expression of the highest truth of the universe, Herbert argues, that exists first in God.

Herbert's philosophy of mind departs from medieval, Renaissance, and early modern theories. He diverges widely from Scholastic views by dispensing with intelligible species, and further by denying that the mind is active in abstraction of species but passive in its reception of them. At the

same time, however, does not closely resemble prominent early modern viewpoints on the mind. Herbert of Cherbury does not advance a materialist viewpoint, like Thomas Hobbes, and he is not a substance dualist, like Rene Descartes. For Herbert the body is an intermediate of sorts that bridges the natural world and consciousness. In some respects, Herbert's views resemble some Renaissance and early modern Platonists, especially G. W. Leibniz, who believed that there is a pre-established harmony between the intellect and other substances.

Today Herbert is most widely known for his doctrine of common notions that was famously criticized by John Locke in Book I of *Essay Concerning Human Understanding*. In *De veritate*, he argues for a faculty of natural instinct that is responsible for a set of common notions that enjoy common consent or universal assent. The divine light of truth, Herbert explains, is strongest in the natural instinct, which is communicated to it directly from God. For Herbert, however, there are distinctions to be made among common notions; some are immediately and intuitively known in themselves, while others require the aid of reason and discourse in order to be evident. Herbert argues that there are five common notions that pertain to religion, and for which there is common consent: (1) that God exists; (2) that God should be worshipped; (3) that virtue and piety are the core of worship; (4) that sin requires repentance; and (5) that God will reward and punish justly. These five notions are the core tenets of early English deism.

Chiaromonti, Scipione

Born: 21 June 1565, Cesena, Italy

Died: 3 October 1652, Cesena, Italy

Matteo Cosci

Università Ca' Foscari Venezia, Venice, Italy

Abstract

Italian philosopher and astronomer, Scipione Chiaromonti (1565–1652) was one of the last defenders of the Aristotelian orthodoxy in its entirety and in particular in regard of the traditional cosmological view, openly arguing with intellectual personalities of his time such as Tycho Brahe, Johannes Kepler and Galileo Galilei and their new discoveries.

Biography

Defender of old academic as well clerical interests, Scipione Chiaromonti turned out to assume the role of intransigent and conservative Aristotelian philosopher during an age in which orthodox Aristotelianism was increasingly under attack. Born in a rich and noble family in Cesena and graduated in Philosophy at the University of Ferrara, he became soon and without resistance the heir of a cultural tradition made of dogmatic scholasticism and erudite scholarship. Polemicist,

polygraph, and pedantic compiler of various works on different topics, Chiaromonti was a learned and prolific writer along all his life. About his first production, it is possible to mention his written answer about the problem of making shooting munitions, his (posthumous) treatise about scenic perspective for theatrical backgrounds, and also a couple of studies about the relation between physiognomy and living environment, but Astronomy remained a consistently favored subject of dispute. Since the beginning of his career, he taught Natural Philosophy at the University of Perugia, having become the mathematician of Cardinal Alessandro d'Este. Later, he also enjoyed the favor of the Duke Cesare of Este, to whom he dedicated his *Discourse about the comet* (Venice, 1619) where he defended in a prejudicial way the sublunar nature of some unexpected celestial phenomena, like comets and novae. Along such lines, in his *Antithyco* (Venice, 1621), Chiaromonti strongly polemicized not only against Tycho Brahe but also against the Italian astronomer Orazio Grassi, upholding the traditional Aristotelian views even against new astronomical evidence. As a late herald of Ptolemaic cosmology, he attracted many uncharitable criticisms by Kepler, who some years later publicly replied him with his *Tychonis Brahei dani Hyperaspistes, adversus Scipionis Claramontii. . . Anti-Tychonem* (Frankfurt, 1625). Kepler's attack gave to Chiaromonti the pretext to reiterate publicly his bookish knowledge, first in his *Apologia pro 'Antitychone' suo, adversus 'Hyperaspitem'* (Venice, 1626) and then in his *De tribus novis stellis* (Cesena, 1628). Despite some prudent appreciation at first, Galileo Galilei addressed sarcastic remarks against him in his *Dialogo* (Florence, 1632), and also Galileo's students and partners did not show any serious consideration of his work in their correspondence but only sarcasm and deprecation (Benzoni 1980). Nonetheless he was appointed to the position of Lecturer in Philosophy at the University of Pisa. From there he had to vindicate constantly the value of the Aristotelian doctrine, as well as his professionalism, from disreputation. He tried to accomplish this task by means of his vernacular dialogue with

the eloquent title of “Self-defence of ‘Anti-tychone’ and of my ‘Treatise of the Three Stars’ from the author of the Dialogue [namely, Galileo]’s attacks ... in favour of Aristotle’s main dogmas in regard of the heavens ... and in rejection of the Copernican system” (Florence, 1933). In the following years, his treatises fueled analogous disputes, for example, against the mathematician Giovanni Camillo Gloriosi, against the peripatetic “coreligionist” Fortunio Liceti, and also against the Jesuit Nicolò Cabeo, who replied all on their turn. The point of contention was mainly the nature and location of what seemed to be apparent generations of stars and comets over and beyond the sublunar region of the sky – something that Chiaramonti always and consistently denied in accordance with the Aristotelian view. In fact in his */De methodo ad doctrina spectantem/* (Cesena 1639) he made “no pretense of originality... The Greek commentators [were] discussed, together with Averroes and Avicenna, with the sources cited in convenient fashion... This traditional Aristotelian felt no obligation to point out the use of Peripatetic theories of method by Galileo: his discussion deal [ed] only with the text of the Master” (Neal Ward 1963, 194–196), with aversion for anything new. He regarded the images provided by the telescope as perceptual illusions, whose deceptivity should have been somehow made known. Despite the occurred death of Galileo, Chiaramonti did not renounce to publish a resentful rejection of his theories (*Antiphilolaus*, Cesena, 1643). After his commitment in Pisa, he retired back to Cesena, where he took part to the diplomatic life of his hometown as designated ambassador. Moreover he wrote some last treatises about political theory, local historiography, philosophical methodology, and further commentaries on Aristotle. Not without a shade of irony, Chiaramonti’s erudition became proverbial. In fact, although the coeval poet Pier Francesco Minozzi named him as a sort of “Aristotle of our times,” Chiaramonti seemed always to be bound more to the letter of the Aristotelian lines than to the spirit of inquiry promoted by those texts that he so often quoted and flaunted.

Chillingworth, William

Born: October 1602, Oxford

Died: 30 January 1644, Chichester

Han Thomas Adriaenssen

Faculty of Philosophy, University of Groningen, Groningen, The Netherlands

Abstract

William Chillingworth was an English Protestant theologian. In his 1638 *Religion of the Protestants*, he argued that the scriptures are our rule of faith. Although we may not be able to establish their text and meaning with

absolute certainty, we can have moral certainty or certainty beyond a reasonable doubt.

Biography

William Chillingworth was born in Oxford in 1602. Having attended a grammar school there, he was admitted to Trinity College in 1618, where he graduated B.A. in 1620 and M.A. in 1624. In 1628, Chillingworth was elected a Fellow of Trinity. During his years at Trinity, Chillingworth came into contact with the Jesuit John Percy, alias Fisher, who convinced him that an infallible church was needed to guide Christians in their faith. Under Fisher's influence, Chillingworth in 1629 converted to Roman Catholicism and in 1630 travelled to the Catholic seminary of Douai, France. Perhaps influenced by letters sent to him by his godfather William Laud, the later archbishop of Canterbury, Chillingworth at Douai soon came to doubt the Roman church's claim to infallible authority and returned to England in 1631, reconverting to Protestantism in 1634. In 1635, Chillingworth became prebendary of Chester Cathedral and in 1638 was nominated chancellor of Salisbury Cathedral. After the outbreak of the English Civil War, Chillingworth joined the Royalist party. A chaplain to the Royal army, he was taken prisoner at the surrender of Arundel Castle in 1643. In poor health, Chillingworth was held at the bishop's palace at Chichester, where he died 30 January 1644 (See also Chernaik 2004).

The Religion of Protestants

Soon after his return to England in 1631, Chillingworth had begun to frequent the meetings of scholars and intellectuals that were held at Great Tew, the country house of his friend Lucius Cary, the second Viscount Falkland (On the Great Tew Circle, see Mortimer 2010, 63–87). At Great Tew, Chillingworth and Cary discussed the ideas of Grotius and of the Socinians, who insisted that Christians should take their own critical reason, not ecclesial authority, as a guide in reading the

scriptures. This insistence on individual reason would become a major theme in Chillingworth's most important work, his 1638 *The Religion of Protestants a Safe Way to Salvation*.

The Religion was written in response to the Jesuit Matthew Wilson, alias Edward Knott. Between 1630 and 1634, Knott had been engaged in a controversy with the English clergyman Christopher Potter, attacking Protestantism on the ground that without the infallible authority of the church to decide on the correct interpretation of scripture, "every man is given over to his own wit and discourse" (Chillingworth 1838, vol. 1, 10). This was dangerous, Knott reasoned, for at least two reasons. First, the scripture is hard to understand, and so we cannot expect the untrained to discover its true message without a guiding authority. Second, if every man is to decide on the meaning of scripture for himself, subjectivism looms large.

To the first point, Chillingworth responded that those biblical truths that were necessary for salvation were "plain and easy," so that with regard to these, every reader is "a competent judge for himself" (Chillingworth 1838, vol. 1, 172). To the second, he responded that reason must guide all scriptural reading. Our rationality we share with all other men, and it is "public" in the sense that rational arguments are open to trial and examination (Chillingworth 1838, vol. 1, 282). Therefore, readings that meet the standards of reason will enjoy more than just an individual validity. When reason guides us in our faith, we will "believe many things above reason, but nothing against it" (Chillingworth 1838, vol. 2, 453). For example, we will not accept the doctrine of transubstantiation, which goes against reason. But we will still believe in a triune God, which, though above our understanding, does not contradict it.

Chillingworth believed that scripture read in the light of reason was "sufficient to inform us what is the faith" (Chillingworth 1838, vol. 1, 71). Yet he admitted that we could not be absolutely certain about the text or meaning of the scriptures. In general he denied that absolute certainty was humanly attainable. For the most part, we have but a "moral certainty," or a certainty beyond a reasonable doubt. Thus we are morally certain that a

given scriptural passage has been preserved uncorrupted or that we correctly understand its meaning. But just as certainty beyond a reasonable doubt suffices for a judge to convict a criminal, moral certainty is certainty enough to guide us in religion (Van Leeuwen 1970, 15–32).

Chivalry, Renaissance Concept of

Elizabeth Ashcroft Terry-Roisin

Department of History, Austin College, Sherman, TX, USA

Department of History, Florida International University, Miami, FL, USA

Abstract

Broadly speaking, chivalry or chivalric culture was a set of values cultivated by Europe's military elite from the twelfth to the seventeenth century. These values differed in time and in place and interacted with other cultural values, such as those of the European Renaissance movement. Chivalric values often greatly contrasted with reality and were not embraced or acted upon by all warriors, knights, or nobility. While there was no "chivalric code" that all knights ascribed to, it is possible to identify several core chivalric

ideals which appear in numerous types of sources over time. These were loyalty to one's lord, skillful fighting on horseback (prowess), and generosity to one's men (largesse). These ideals appear somewhat consistently starting in the twelfth century in both proscriptive literature for real knights and imaginative literature and chivalric romance. European chivalric culture was transformed by tensions between courtliness and prowess and between history and legend, as well as by the rise of the early modern state and the construction of its new armies and bureaucracies. Periodization for the end of chivalry helps to shape scholarly understanding of the nature of the European Renaissance and of the early modern period itself.

Introduction

The chivalric ethos developed in Northern Europe, in the aftermath of the Carolingian Empire. Vikings and Northmen settled in Normandy and built castles (Searle 1988). The practice of a lord having his warriors live with him in a castle where he provided for their needs, including a horse and chain mail, slowly became more common, just as the idea of knighthood also became fully formed, in the twelfth century. The twelfth century was a time of expansion, crusading, and conquest for Europe and also the time of chivalry's first distinct entry into European culture. The international military orders, such as the Knights Hospitaller, were founded in the eleventh and twelfth centuries, in the age of the Crusades against Muslim powers in the Holy Land. These monastic, military, and chivalric orders were real fighting organizations. Furthermore, among lay knights, the concept that there was a general "order of knighthood" also developed – that in society there was the order of marriage, the monastic order, the order of the priesthood, and the order of knighthood, which was the "most rigorous order of all" (Kaeuper 2009, 95). It was in this expansive period when lay knights began to develop an ideology of chivalry, which included religious values.

According to historian Richard Kaeuper, the religious ideology of chivalry in the Middle Ages had several components. First, knights were meant to suffer, and suffering was meritorious for their salvation (Kaeuper 2009, 95). Whether fighting Muslims or their fellow Christians, they considered fighting loyally for their lord to be meritorious. Secondly, as military heroes and suffering servants, knights emulated and imitated Christ, especially according to the soteriology of St. Anselm and others (Kaeuper 2009, 107, 116–118). The Christ-knight concept became especially popular as Cistercian spirituality developed in the twelfth century. Many of St. Bernard of Clairvaux's monks had been knights before they took their vows, steeped in the culture of chivalric romances and courtly love from Northern France, exemplified by the romances of Chrétien de Troyes and the poems of Marie de France. The chivalric values of Bernard and the young knights who joined him not only influenced a new type of monastic spirituality, distinct from the Benedictine monasticism of Cluny, but Bernard was also a spokesman and advocate for the new military orders – particularly, the first major military order, that of the Templars, in his book *Liber ad milites Templi: De laude novae militiae*.

Medieval peoples experienced the culture of knighthood in a variety of ways, but in general, there are three types of written sources they have left us which express their chivalric ideals – the writings of clerics (Bernard of Clairvaux and early members of crusading orders can be included in these), the proscriptive manuals of chivalry and histories written by secular knights and noblemen, and the imaginative literature and chivalric romance, written by a variety of authors (Painter 1940; Keen 2005). For a comprehensive history of chivalry, all three of these sources need to be examined.

Heritage and Rupture with the Tradition: Courtliness and Conquest

In these three types of sources, loyalty, prowess, and largesse were routinely praised as necessary

qualities in a knight. In one important thirteenth-century manual, written by the Catalan cleric, Ramon Llull, knighthood was given an origin story in the distant past:

In the beginning, when contempt for justice had come into the world because of the diminution of charity, justice sought to recover its honor by means of fear. And thus the entire populace was divided into groups of a thousand, and one man—more kind, wise, loyal and strong, and with nobler courage, a better education and better manners than all the rest, was picked and chosen from every thousand. (Llull 2013, 40)

This man was given a horse and was called to join the order of knighthood. In this description it is clear that both prowess and strength and education and manners were necessary qualities for Llull's legendary first knight.

One of the founders of European chivalric culture was Geoffrey of Monmouth, writing in Oxford in the twelfth century. In his *History of the Kings of Britain*, Geoffrey provided the core of the Arthurian legend – King Arthur, his round table and his knights, and Merlin and his prophecies. Significantly, Geoffrey wrote that King Arthur's court had “such a code of courtliness” that “even the man of noblest birth, once he was roused to rivalry, thought nothing at all of himself unless he works his arms and dressed in the same way as Arthur's knights.” However, Arthur was not just a man of courtly ideals; he also had imperial ambitions. “The fact that he was dreaded by all encouraged him to conceive the idea of conquering the whole of Europe” (Monmouth 1966, 222). Not merely a provincial ruler, Geoffrey's Arthur faced the Romans themselves in battle and acquitted himself well against the most powerful army in the world.

From the start, the histories of courtliness and conquest, the courtier and the knight, were intertwined. C. Stephen Jaeger, following Norbert Elias's *Civilizing Process*, describes the early history of this tension in his book on *The Origins of Courtliness, 939–1210*. For Jaeger, the courtier bishop of the Ottonian court embodied the civic ideals he took from Cicero and Roman statesmen and imposed them upon the warriors of the court, who ultimately internalized the ideals, striving to

uphold them themselves (Jaeger 1985, 4–15). These values were then reinforced by the narratives of chivalric romance (Jaeger 1985, 236–254). The question of how chivalric values civilized and controlled violence, or did not, is one of the more interesting questions in the historiography of chivalry.

One of the most famous knights of the twelfth century, William Marshal, born in England in 1147, took on multiple roles in his career, including courtier. After he learned the trade of knight in Normandy, he worked on the tournament circuit to gain wealth and a potential employer. There he met Henry, son of the English King Henry II, known as the “young king,” and then served in his retinue. After the death of the “young king,” Marshal went to Jerusalem to fulfill a vow. He fought in a variety of Angevin conflicts, married well, became a landed baron, and joined in imperial adventures in Wales and Ireland, and he was a signer of the Magna Carta. Marshal’s career peaked when he served as Lord Protector when King Henry III was a boy. On his deathbed in 1219, William renounced his wife and joined the Templar order. He was a knight and Templar but was also clearly an influential courtier and statesman (Asbridge 2014).

Late medieval proscriptive literature for knights often emphasized the need for greater asceticism and restraint. Fourteenth-century French nobleman Geoffroi de Charny, in particular, discouraged knights from excessive ease or pleasure (de Charny 2005). Some clerical authors, such as the Castilian, Alonso de Cartagena, even discouraged the joust (Fallows 1995, 129–141). Fifteenth-century Castilian nobles and *caballeros*, best exemplified by the Marqués de Santillana, became interested, as a group, in rhetoric and poetry in addition to traditional martial pursuits (Nader 1979). Baldassare Castiglione’s famous book, *Il cortegiano* [The Courtier], first published in 1528, revealed tensions between martial and courtly ideals and contains lively debates about what qualities a courtier needed most in order to best influence his prince. Juan Boscán translated the Italian original into Castilian and published it in 1534, and translations into other European languages followed soon after. Castiglione had spent

the last 5 years of his life in Spain, having been just named the Bishop of Ávila. His work emerged out of both Spanish and Italian contexts (Navarrete and Terry-Roisin 2019).

The expansion and exploration which characterized Europe in the early modern period were inspired in part by the success and momentum of the Reconquista, which moved from Iberia to a new theater in the New World after 1492. Many Iberian *conquistadores*, desirous of land and titles, were either already members of the Spanish military orders or hoped to become so – Hernán Cortés was, for example, a *caballero* in the Order of Santiago. In the sixteenth and seventeenth centuries, the Morisco Granada Venegas family used membership in the military orders as part of their strategy to enter the Spanish nobility – a quest in which they were successful, when Don Pedro de Granada Venegas became the Marqués of Campotéjar in 1643 (Terry 2015).

History and Legend

In the twelfth century, Geoffrey of Monmouth had traced the races of the British Isles to the ancient Trojans. In the cult of the Nine Worthies, popular in Valois Burgundy and elsewhere in the fourteenth century, Hector, Caesar, Alexander, Joshua, David, Judas Maccabeus, Arthur, Charlemagne, and Godfrey of Bouillon were all admired together as eternal military heroes (Huizinga 1924, 60–61). Despite Renaissance emphases on historicity, the early modern period was not immune to an interest in these figures, considering that as late as the end of the seventeenth century an Englishman wrote an extended biography of them (R.B. 1687). The cult of the Nine Worthies honored historical figures (Julius Caesar), as well as figures from Greek myth (Hector), from the Bible (King David), and from European myth and legend (King Arthur). However, there was another genre of work honoring famous men which was more concerned with historicity, known as the “lives of illustrious men” or the *De Viris Illustribus*. The genre arose in antiquity with Plutarch and Polybius and was taken up by St. Jerome in the fifth century, who, instead of

listing Caesars, included the apostles and bishops who followed them in time, starting with St. Peter. St. Isidore of Seville wrote another version in the seventh century, adding 33 more men. In the ninth century, Carolingian historian Notker the Stammerer made his own version of the lives of illustrious men that included his contemporary Alcuin (Phelan 2014, 271). In the fourteenth century, Petrarch famously wrote another version of the *De Viris Illustribus*. Paolo Giovio wrote one in the sixteenth century that followed ancient, medieval, and Renaissance precedent, but its addition of portraits with almost every entry, and its vast size and scope, covering men from across time and space, from antiquity to the sixteenth century, from Italian generals to Ottoman Sultans, connected it to both the Renaissance cult of personality and the high politics of sixteenth-century Europe. In 1568, Granadan humanists Gaspar de Baeza and Gregorio Sylvestre would translate Giovio's Latin volume on the men of war into Spanish.

One of the major differences between medieval chivalric culture and the culture of the European Renaissance is the emphasis the Renaissance movement placed on historicity and the ideal of an authentic revival of antiquity based on criticism of primary sources rather than on legend. According to scholars of Arthurian literature Rob Gossedge and Stephen Knight, "another source of Arthurian doubt was the increasing value given to classical learning over medieval tradition: Aeneas had become a more credible nation-builder than Arthur" (Gossedge and Knight 2009, 103). Though modern scholarship would probably ascribe to Arthur and Aeneas comparable claims to historical veracity, the interest in going to ancient sources *ad fontes* and the rejection of medieval authors who had also commented on those sources is an orientation of the Renaissance which its contemporary movement, the Reformation, also shared.

While there is robust scholarly debate surrounding many of these issues, two individuals, Francesco Petrarch and Lorenzo Valla, discussed together, are representative of a Renaissance view of history and a Renaissance orientation toward historical sources. Petrarch wrote in the fourteenth

century that he did not include any of his contemporaries in his *De Viris Illustribus* because he was "unwilling to carry my treatment to such a distance and through so many shadows (*tenebrae*) for so few famous men" and that he thus "set and determined the limit of my history long before our century" (Petrarch cited in Witt 2000, 281). The shadows between himself and the Ancient Rome he admired and wished to revive were a Middle Age of little historical importance. From his formulation, and those of others after him, historians have created the tripartite periodization of ancient, medieval, and modern, which is an innovation of the Renaissance. In the fifteenth century, Lorenzo Valla used the historical tools of the *studia humanitatis*, including his knowledge of Latin, to unmask the supposed Donation of Constantine as a ninth-century forgery. The admixture of history and legend was seriously challenged by Renaissance authors, but the practice did not entirely die out. Ronald Witt has argued that while Petrarch had an historian's sense of distance from his chosen Roman subjects and he understood Roman historians as imperfect men who wrote arguments, he still confused myth and history (Witt 2012).

The legend of the last world emperor was a similar fusion of history and legend to that of the Nine Worthies. This legend dated from interpretations of the book of Revelation which were made at the court of the emperor Constantine in the fourth century and were repeated and elaborated in many medieval sources. According to historian Marie Tanner, in the legend of the last world emperor:

...the Kingdom of God, which was foreshadowed in Revelation, will come when the Last World Emperor has defeated the heretic. After this, the emperor will go to Jerusalem and recover the Holy Sepulcher. When this is accomplished, he will put off his diadem, lay aside his whole imperial garb, and render the empire to Christ. This event will usher in the thousand years in which Satan is bound. At the end of this time, divine forces shall defeat the Antichrist in a final battle. (Tanner 1993, 121)

The struggle for an authentic revival of antiquity based on primary sources, *ad fontes*, constituted a large part of European culture in the fifteenth and

sixteenth centuries, yet the Habsburg dynasty remained intrigued by the legend of the last world emperor, and despite Lorenzo Valla's famous unmasking of forgeries using his humanist tools, forgeries were still being written. Courtier Antonio de Guevara, in his *Golden Book of Marcus Aurelius* (1528), used "forged" letters from the pagan emperor Marcus Aurelius to urge Holy Roman Emperor and King of Spain Charles V to stoic resolve and military triumph (Dandeleit 2014, 88–90). Finally, much Renaissance art and literature celebrated Greek and Roman gods and legends.

Impact and Legacy: The Survival of Chivalric Romance

Chivalric romance, as a genre, provides key primary sources for European chivalric culture. Medieval romances such as Chrétien de Troyes' *Yvain, Erec et Enide*, and *Le Chevalier de la Charette*, Wolfram von Eschenbach's *Parzival*, and the English *Sir Gawain and the Green Knight* established the genre. Chivalric romances like Garci Rodríguez de Montalvo's *Amadís de Gaula* (earliest remaining printing, 1508) and Thomas Malory's encyclopedic *Le Morte d'Arthur* (1485) remained popular as Europe passed into the world of print in 1450. With the exception of Geoffrey of Monmouth, early authors depicted Arthur as a weak king, and knights like Gawain and Lancelot dominated his court. In later medieval romance, many Arthurian knights became hermits, and their adventures were focused on religious pursuits and on the Holy Grail. However, the early modern Arthur became a powerful ruler again, and various English authors wrote Arthurian tales as "royal propaganda" for the Stuarts (Gossedge and Knight 2009, 104–105).

In the late fifteenth and early sixteenth centuries, a hybrid genre emerged in Italy called the epic chivalric romance, or the Renaissance epic. In this genre, epic battles reminiscent of the work of classical authors like Virgil were interspersed with typical courtly scenes taken from chivalric romance. The primary examples of this

genre are Luigi Pulci's *Morgante* (1483), Matteo Maria Boiardo's *Orlando innamorato* (1485), and Ludovico Ariosto's *Orlando Furioso* (1516). Boiardo and Ariosto follow the topic of the "matter of France" and the court of Charlemagne, which had been first substantially laid out in the twelfth-century *Song of Roland*. However, instead of the twelfth-century Roland whose emotions were tied to his love and loyalty toward his fellow knights, the Orlando of Ariosto "loses his wits for alluring Angelica" (Whitman 2015, 14). According to Eleonora Stoppino, Ariosto draws from both medieval and classical traditions, from both romance and epic. (Stoppino 2012, 9–13). In England, Philip Sidney's *Arcadia* (1590), Edmund Spenser's *Faerie Queen* (1590), and John Milton's *Paradise Lost* (1667), while substantially different, also contained some elements of this hybrid genre.

In the early modern period, chivalric romances became the object of some criticism. In sixteenth-century Granada, a bookseller became convinced that selling romances was a sin and dramatically tore up his books and became a local holy man named San Juan de Dios (Coleman 2003, 131). Sixteenth-century Spanish saints St. Teresa of Ávila and St. Ignatius of Loyola both rejected chivalric romance. It played a starring role in the "early temptation" part of their conversion stories. An Italian Jesuit named Antonio Possevino expressed his concern in 1593 that chivalric romances, including the *Orlando Furioso*, had an "immoral, heretical influence on the nobility" (Scaglione 1991, 273). According to Jon Whitman, these Italian critics "aligned poetry with history" and "treat(ed) romance as a defective form of epic" (Whitman 2015, 17). Over time, chivalric literature had come to be seen as secular literature and popular entertainment – something dangerous and worldly – yet in the early modern period, it was still extremely popular among readers and was culturally significant (Eisenberg 1982). For example, in 1575 Torquato Tasso published his *Gerusalemme liberata*, an epic poem about the First Crusade which drew on chivalric themes to engage with Counter Reformation questions and debates, which impacted his *Gerusalemme conquistata* (1593) even more.

In Cervantes' famous work of 1605, *Don Quixote*'s friends tried to rid the hidalgo of his chivalric romances, because they had "lied" and led him into madness.

Albert Ascoli writes in his Introduction to Sergio Zatti's book, *The Quest for Epic* (Zatti 2006), that

Ariosto certainly takes notable steps towards 'epicizing' the chivalric *romanzo*; Tasso is notoriously the more attentive to that defining trait of the modern novel, character psychology, and his overt attacks on what he perceives to be the corrupting ethos of chivalry in fact rather closely match the moving premise (however pretextual) of the *Qui-xote* . . . the Italian cinquecento has its own internal literary history that may tell us something different about the refashioning of classical epos and medieval *romanzo* into the forms of literary modernity. . . (Ascoli in Zatti 2006, 2).

Early modern literature drew from the epic and lyric traditions of antiquity, as well as the worlds of romance, and some imitated antiquity more than others. Vaz de Camoes *The Lusoids* (1572) is a good example of what Thomas Dandele calls an "imperial Renaissance" text, because the crew of Vasco da Gama's ship appeared in its pages like the crew of Aeneas and Roman gods influenced the plot. The work gave prestige to Portuguese imperial projects in Asia and Africa by associating them with Roman epics and with the founding of the Roman Empire. Another example is Juan Latino's Latin epic poem, the *Austrias Carmen*, celebrating the victory of Don Juan de Austria and the "Holy League" over the Ottoman Turks at Lepanto in 1571 (*The Battle of Lepanto* 2014).

Chivalry as Revival

A complicating factor in the interplay between Renaissance culture and chivalric culture is that chivalry itself was thought to be of ancient origin and was an object of revival. A statement at the beginning of Chrétien de Troyes' twelfth-century romance, *Cligés*, reads, "Our books have taught us that chivalry and learning first flourished in Greece, then to Rome came chivalry and the sum of knowledge, which now has come to

France. May God grant that they be maintained here. . ." (de Troyes, 123). As a type of revival, the Order of the Star was founded by the French king Jean II in the fourteenth century to compete with the English Order of the Garter in order to inspire more of his men to fight the English boldly. They did so at the battle of Poitiers in 1356 when Geoffroi de Charny and the knights of the Star died en masse. In 1430, the Dukes of Burgundy also founded an order to compete with the Garter, the Order of the Golden Fleece, with the stated goal of taking back Jerusalem from the Turk, and though they did build a fleet of ships to do so, this goal was not realized (Smith and DeVries 2005). The Valois Dukes, and later Maximilian I, Holy Roman Emperor (d. 1519), with his autobiographical romance, *Theuerdank*, and Henry VIII Tudor, with his jousts, sought to revive an age resembling that of William Marshal and Chrétien de Troyes in the twelfth century. The desire to revive a Golden Age was a part of both chivalric and Renaissance cultures, yet the nature of that Golden Age differed between them, for example, Florentine Coluccio Salutati's fascination with the Roman Republic and the early Tudors' fascination with Arthur and his round table.

The End of Chivalry

A number of historians of chivalry, including Maurice Keen and Richard Kaeuper, argue that the history of chivalry ends in the sixteenth century. Kaeuper points to Reformation doctrines disputing the role of good works and penance in salvation, famous peacemaking humanists who criticized war, such as Erasmus, and a revolution in military technology and strategy as causes for chivalry's end (Kaeuper 2009).

Another argument is that the independent knight of the Middle Ages became a key advisor and companion to his prince, spurning war for rhetoric, manners, and poetry – that the knight left knighthood for courtiership and was "civilized." Norbert Elias, Ignacio Navarrete, and Leah Middlebrook have all emphasized the significance of this transformation, and Ignacio

Navarrete has especially explained the role of Castiglione's *The Courtier* in representing a fascination with Renaissance courtiership in both Italy and Iberia. Both Machiavelli's *The Prince* and Castiglione's *The Courtier* were published in the early years of the sixteenth century.

Two general elements of courtiership are giving advice and seeking favor. In *The Prince*, Machiavelli's advice did not contain an exhortation to traditional chivalric values, like keeping one's word, or generosity. Rather, Machiavelli tempered these values with the practical advice that a prince should appear to have these qualities but only use them if they actually help him maintain power. He should be willing to act against them at a moment's notice, like Ferdinand of Aragon clearly was able to do, using religion as a "cloak" (Machiavelli, Ch. XXI, 77). Machiavelli wrote, in Ch. XVIII of *The Prince*:

It must be understood, however, that a prince—especially a prince who has but recently obtained power—cannot observe all of those virtues for which men are reputed good, because it is often necessary to act against mercy, against faith, against humanity, against frankness, against religion in order to preserve the state. (Machiavelli, Ch. XVIII, 63)

Machiavelli emphasized first and foremost the prince and his courtiers' duty to the success of the state. In the twelfth century, John of Salisbury had written another "mirror for princes" called the *Policraticus*, and he was also a learned man who took *exempla* from antiquity. However, to Salisbury, the primary obligation of a soldier, and a prince, was to God, not to political leaders and institutions: "In addition, this formula is to be prescribed for and fulfilled by every soldier: that he will keep unimpaired first the faith owed to God, and thereafter the loyalty owed to the prince and to the republic" (Salisbury 1990, 117). To Salisbury, chivalric virtues and ideals were worth pursuing for their own sake, "As the image of the deity, the prince is to be loved, venerated, and respected; the tyrant, as the image of depravity, is for the most part even to be killed" (Salisbury 1990, 191). Politics, in Salisbury's rubric of Christian kingship, were a holy calling, and God would ultimately judge the prince. Machiavellian politics

were that the ends (the success of the state) justify the means (any means necessary). In *The Prince*, virtue was a tool, not an end.

In between the lives of John of Salisbury in the twelfth century and Machiavelli in the sixteenth century was that of Leonardo Bruni of Florence (d. 1444). Bruni wrote a treatise, *On Knighthood*. In it, he wrote that

the miles (soldier) is nothing but the guardian of the citizens and a wager of war who has been legitimately qualified for this task by his own oath. The militia itself is a highly respectable and indispensable institution designed by nature to hold the city together (Bruni 1987, 135).

In addition to identifying the knightly profession with the urban environment, Bruni also traced the differences between soldiers on foot or on horseback to the difference between foot soldiers and the noble equestrian order of ancient Rome. He thus linked chivalry with a revival of antiquity—but his were never the knights errant of romance—they were the citizens of a Renaissance city.

On a practical rather than ideological level, knighthood clearly continued into the early modern period. Knighthood remained a real military office in the sixteenth century, and knights continued to join active military orders like the Orders of Santiago and Alcántara in Spain. One change that historians of chivalry point to is that knighthoods were increasingly granted only as gifts from a prince or ruler. Ultimately, the rise of the early modern state killed the independence of the knights, and their sacrifice began to be channeled toward national goals—the famous sixteenth-century French chevalier Bayard's battle cry was "France! France!" (Kaeuper 2009, 214). The end of Olivier de la Marche's chivalric romance and treatise on preparing to die, *Le Chevalier Deliberé* (1488), was a memorial to the house of Valois Burgundy, and its sixteenth-century versions celebrated the Tudors and the Spanish Habsburgs. Historian Nigel Saul calls this "a chivalry harnessed not to knight errantry but to the service of the state" (Saul 2011, 346). A comprehensive history of chivalry should compare the service of these early modern knights to that rendered by William Marshal to the Angevin empire. Most importantly, however, these early

modern states, with their growing bureaucracies, had the sort of war budgets that made it impossible for nobles to have enough men and arms to compete. For instance, a knight might still be required to supply his own armor and horse, but not his own cannon – the cannons belonged to his prince (Keen 2005, 241). Gunpowder and the military revolution would change the way war was waged and impact the future of the mounted knight (Rabb 2006).

Historians have identified two other trends which helped to bring knighthood and the power of the nobility to an end in the seventeenth century. One was the “inflation of honors,” in which cash-strapped monarchs like James I of England sold offices to any who were able to pay, thus cheapening the concepts of knighthood and nobility (Dewald 1996, 27; Stone 1967). The other trend was the “domestication” of the nobility by a powerful absolutist monarch like Louis XIV of France: rich territorial lords and military leaders became merely domestic servants of the crown (Elias 2000). According to these arguments, first published by Elias in 1969, far from the influential courtier of Castiglione’s sixteenth century, these seventeenth-century nobles were weak and dependent on their king. These were symptoms of an age of crisis. Jeroen Duindam, in his book, *Myths of Power*, disputes this, arguing that Elias exaggerated this change (Duindam 1995).

Interconnections

Western Europe was not the only region of the world to develop a warrior ethos. In a broad history of chivalric culture, the ideologies espoused by Islamic warriors and holy men from across the Mediterranean, including in the tenth-century *Way of Sufi Chivalry* (al-Sulami 1983), should also be examined, as should the ethos of the medieval Japanese samurai, which was laid out by Nitobe Inazo (1862–1933) in *Bushido* (Inazo 2012). It is important, however, for scholars to make precise statements about these different systems. Many historians of Japan argue

today that the samurai can be compared to European knights but should not be seen as simple analogues to them.

One of the best places to examine the interactions between Islamic and Christian warrior elites is on the border between Nasrid Granada and the kingdom of Castile in the fifteenth century, where frontier ballads like *Abenamar*, *Abenamar* praised the qualities of Muslim nobles. The king of Castile had a “Moorish guard,” which was his personal bodyguard and retinue (Echevarría 2009). During and after the Conquest of Granada (1492), a number of Muslim Nasrid knights converted to Christianity and became members of a new Morisco elite. In particular, Cidi Yahya Al Nayar (d.1506) changed his name to Don Pedro de Granada and founded the Granada Venegas family. The Granada Venegas successfully assimilated into the high Spanish nobility, sponsored a group of Renaissance poets, and entered the Spanish military orders, using both classical culture and chivalric culture to their advantage (Terry 2015).

The historiography of chivalry demonstrates how the culture of Europe’s elites can influence medieval and early modern periodization. Debates regarding the timing and nature of chivalry’s end are also debates about what early modernity was and about what the Renaissance was.

Chortasmenos, Ioannis

George Zografidis

Department of Philosophy, School of Philosophy and Education, Aristotle University of Thessaloniki, Thessaloniki, Greece

Abstract

Ioannis Chortasmenos (ca. 1370–1431) was a scholar, mathematician, astronomer, and bibliophile; under the name Ignatios he became Metropolitan of Selymbria. He taught in Constantinople philosophy (logic) and rhetoric to major intellectuals of late Byzantium (Bessarion, Scholarios) and wrote compendiums and textbooks on these fields, especially on Aristotelian logic. He continued the commentary tradition of the Palaeologan Byzantium and he compiled introductory texts for educational purposes. As a bibliophile and a copist, he contributed to the circulation of philosophical and scientific texts.

Biography

Ioannis Chortasmenos (Ignatios) was born ca. 1370. He studied in Constantinople under Michael Balsamon “the Greek courses” (the profane disciplines: logic, rhetoric, quadrivium, and physical sciences) and “the sacred letters” (mostly biblical exegesis). He was a notary and then an advocate of the patriarchal chancery, at least from 1391 to ca. 1415. After 1410, he became a monk and took the name Ignatios. The last years of his life (perhaps from ca. 1425) he was ordained Metropolitan of Selymbria. He died on October 4, 1431.

Ca. 1407/1410 he was honored with the title of “universal teacher” at the Patriarchate School in Constantinople, i.e., a teacher charged to educate the clergymen. Among his pupils were three

distinguished Byzantine theologians, all of them protagonists in the Ferrara-Florence Council (1438–39) and the last two in the Platonists-Aristotelians controversy: Marc Eugenikos (Metropolitan of Ephesus, a leading figure of the Anti-union party), Basil Bessarion (a leading figure of Unionists and later Cardinal), and George Scholarios (later Patriarch Gennadios II). He taught grammar, rhetoric, astronomy, geometry and mathematics, and philosophy (Aristotelian logic).

As many Byzantine scholars of his time, Ioannis wrote a wide range of works. His philosophical writings include a fragmentary Prolegomena to Aristotle's *Organon*; a paraphrase of *Posterior Analytics II*; and perhaps a commentary on Aristotle's *On Interpretation*. Besides some notes and collected excerpts from Aristotle, other short texts have been preserved, e.g., some moral precepts for laymen and clergymen. Chortasmenos wrote also short mathematical and astronomical treatises and exercises (1404–1415), a number of rhetorical works (political addresses, epitaphs, prolegomena to Rhetoric, paraphrases of extracts from Hermogenes), letters, scholia on John Chrysostom, poems, and historical works.

His manifold interests in philosophy, rhetoric, astronomy, geometry, history, etc. lead him to collect, copy, and annotate manuscripts (more than 30 are entirely or partially autographs), and his contribution to the manuscript tradition is significant. His codices include many ancient Greek authors as Aristotle, Plutarch, Lucian, Livianus, and Euripides. Perhaps he was involved in the oldest surviving Greek manuscript of the Bible (*Vaticanus* gr. 1209 or B), and we owe to him the restoration of the valuable for the history of medicine codex of Dioscorides (*Vindobonensis med.* gr. 1) and the rich philosophical codex called *Ocean* (*Laurentianus* gr. 85,1), as well as an enormous compilation of important ancient astronomical texts (*Vaticanus* gr. 1059).

The Commentary Practice of Chortasmenos

By the time of Chortasmenos, commentary had become an inseparable part of Byzantine

philosophical curriculum. Philosophical activity was interwoven with philosophical learning in the patriarchal and private schools, so commentary served didactic purposes though not exclusively. In the intellectual circles in Constantinople in the first decades of the fifteenth century, only few decades before the Fall, rhetoric and logic were two basic subjects of the curriculum, and Chortasmenos' effort was to provide the appropriate texts. He compiled textbooks collecting freely and without due reference from the existing material, i.e., commentaries of late Antiquity and of Byzantine scholars. All these works were meant for esoteric educational use and their copies remained unsigned:

A commentary (paraphrase, *metaphrasis*) of *Posterior Analytics II* composed for his students (main autograph: *Vindobonensis suppl. gr.* 75). More than a half originates in the commentaries of Theodoros Prodromos (twelfth century) and John Philoponus. Chortasmenos deliberately omits their names; that was quite common in Byzantium and it was not considered necessary for a school book. The text varies in the several manuscripts and in some cases is enriched by diagrams and notes. It is integrated in a larger corpus, probably compiled by him, that contains material for his teaching of logic and rhetoric. Its diffusion of the text can be attested by its transmission in ten manuscripts from early fifteenth to the second half of the sixteenth century; among the copyists were Bessarion and George Scholarios.

A logic compendium (*Lovaniensis De Wulf Mansion Centrum* 1) organized near the beginning of the fifteenth century. The manuscript comprises only the scholia concerning *Prior Analytics I*, *Posterior Analytics I-II*, and the beginning of the *Topics* but not the relevant texts of Aristotle. His model was a similar corpus compiled by Neophytos Prodromenos in the middle of the fourteenth century, with texts from the *Organon* and scholia from the Neoplatonic and Byzantine commentaries on Aristotle. Chortasmenos follows the Byzantine tradition of compendiums, mostly on logic; e.g., the "Anonymous Heiberg" (1007), George Pachymeres' *Quadrivium* (ca. 1310), and his condensed paraphrase of Aristotle's philosophical writings (the *Philosophia*). These texts are

introductory and accessible to non-experts in Aristotelian logic.

There are also short logical treatises (Hunger 1969), prolegomena to Aristotelian logic, comments (*marginalia*) on a logical epitome of Neophytos Prodromenos (*Vaticanus* gr. 1018), and collections of “definitions” for logical works of Aristotle. An anonymous commentary on Aristotle’s *On interpretation* was perhaps written also by Ioannis and has been copied by his pupil Scholarios who continued and amplified his commentary activity.

In his *Moral exhortations* and his addresses to the Emperor Manuel II, Chortasmenos refers traditionally to “spiritual” and political precepts that must be combined: compliance to moral rules and the recognition of social hierarchy is the way for the *Homo byzantinus* to be both Christian and obedient to the rules of social behavior. The Christian state is a “legitimate empire” ruled by the law (as opposed to the Turkish), and the Emperor is the animate law, the guarantor of justice, and happiness. It is interesting that Chortasmenos, in an anachronistic manner familiar to Byzantines, contrasts the ancient image of Alexander the Great (as the Byzantine Emperor) to that of Persian Kings (as he calls the Turkish rulers).

Chrysoloras, Demetrius

Born: before 1360, Thessalonica

Died: after 1417- before 1439, Constantinople?

Athanasia Theodoropoulou

Department of Philosophy, School of Philosophy, National and Kapodistrian University of Athens, Athens, Greece

Abstract

Demetrius Chrysoloras was a Byzantine anti-Unionist and anti-Thomist theologian. He was in the service of John VII Palaeologus and a member of the court of the Emperor Manuel II Palaeologus. He wrote theological, philosophical, astronomical, and rhetorical works.

Biography

Demetrius Chrysoloras' precise dates of birth and death are unknown. He was born in Thessalonica sometime before 1360. The widely held view in the past that Demetrius Chrysoloras was Manuel Chrysoloras' brother has been first rejected by Cammelli, and nowadays it remains an open question.

Very little is known about Demetrius Chrysoloras' life. Around 1384/1385 he participated in the delegation sent by John V Palaeologus possibly to the Ottoman sultan Murad I (1362–1389), and probably in the 1390s, he was in the court of John VII Palaeologus in Selymbria. From 1400/1401 to 1403, Chrysoloras stayed in Constantinople and held an official position in the service of John VII Palaeologus. On 28 July 1403, he delivered a thanksgiving oration addressed to the Virgin Mary on the first anniversary of the battle of Ankara. Later that year, he moved to Thessalonica, where he served as representative (*mesazon*) of John VII Palaeologus. In 1407 he was sent by John VII Palaeologus to Constantinople, but the reason for this mission is still unknown. After John VII Palaeologus' death, on September 1408, Chrysoloras returned to Constantinople. In August 1409 he participated as a member of the senate and a domestic (*oikeios*) of the Emperor Manuel II Palaeologus in the synod which excommunicated the former bishops Macarius of Ankara and Matthew of Medeia. Chrysoloras also participated as an imperial delegate in the synod of April–May 1416 for the election of the new Patriarch of Constantinople.

Chrysoloras' death should be placed presumably in Constantinople after 1417 and before 1439, based on the chronology of his correspondence and writings, according to which he received a letter (no. 61 in Dennis' edition) from the Emperor Manuel II Palaeologus in 1417, and he wrote his *Διάλογος ἀναιρετικὸς τοῦ λόγου, ὃν ἔγραψε κυρὸς Δημήτριος ὁ Κυδώνης κατὰ τοῦ μακαρίου Θεσσαλονίκης, κυροῦ Νείλου τοῦ Καβάσιλα* (*Dialogue on Demetrius Cydones' Antirrhetic against Neilos Kavasilas*) after 1425 and shortly before 1439 (Pasiourtidis' 2013).

Innovative and Original Aspects

Demetrius Chrysoloras is known for his anti-Unionist stance. He wrote several theological treatises on the procession of the Holy Spirit and on the primacy of the Pope in which he defended the Orthodox teachings against the Latin doctrines of the *Filioque* and the primacy of the Pope. Chrysoloras also provided a summary of Neilos Kavasilas' argumentation in favor of the procession of the Holy Spirit only from the Father (see Chrysoloras 1998). Furthermore, Chrysoloras wrote an anti-Thomist fictitious dialogue among Demetrius Cydones, Neilos Kavasilas, Thomas Aquinas, and himself, in which Chrysoloras defended Kavasilas' arguments against Cydones' positions on the *Filioque* and the syllogistic method in theology. In addition to these works, Chrysoloras authored an encomium to Saint Demetrios and many homilies on the birth and ascension of Christ, as well as on the Annunciation and Dormition of Virgin Mary.

Apart from theological treatises, Chrysoloras' corpus includes one astronomical work, two philosophical treatises, and a number of rhetorical writings dedicated to the Emperor Manuel II Palaeologus: a description of the ideal emperor in comparison with the previous emperors (Chrysoloras 1926) and a collection of hundred laconic letters praising the Emperor (Chrysoloras 1984).

Impact and Legacy

Demetrius Chrysoloras' rhetorical writings as well as his extensive correspondence with the Emperor Manuel II Palaeologus are an important historical source for the Palaeologan period.

Abstract

Manuel Chrysoloras was a Byzantine scholar and diplomat. He is best known as the first notable professor of Greek language in Italy.

He occupied the chair of Greek at the Florentine *Studium*, and he also taught Greek occasionally in Pavia, Milan, and Rome. Among his students were some of the prominent early Italian humanists including Leonardo Bruni, Uberto Decembrio, Guarino of Verona, Pier Paolo Vergerio, Palla Strozzi, Roberto Rossi, Jacopo Angeli da Scarperia, Cencio de' Rustici, and others. His method of teaching Greek language and literature was innovative and was continued by some of his students. He had a significant impact on the revival of Greek studies in the West through his *Erotemata*, as this work became the central textbook of Greek grammar until the sixteenth century. He was a pioneer of the so-called *transfere ad sententiam* method for translating Greek texts into Latin, and he was the first who translated Plato's *Republic* (in collaboration with his student Uberto Decembrio). His other writings are mainly rhetorical epistles; he engaged in extensive correspondence with many of his contemporaries, eminent humanists and ecclesiastical and political figures, such as the Emperor Manuel II Palaeologus and Coluccio Salutati. He was appointed to a number of important diplomatic missions on behalf of Emperor Manuel II Palaeologus, and he was in the service of Pisan Pope John XXIII. He spent most of his life visiting the European courts in an attempt to secure help for Byzantium and to negotiate the Union of the Churches. He was an ardent unionist, he participated in the Council of Constance, and he may have converted to Catholicism.

Alternate Names

[Crisolora, Manuele](#); [Crisolora, Emanuele](#); [Chrysoloras, Emmanuel](#)

Biography

Manuel Chrysoloras was born in Constantinople into a noble Byzantine family. His exact date of birth is unknown, albeit it is commonly accepted that he was born around 1350. The widely held

view in the past that Demetrius Chrysoloras was Manuel Chrysoloras' brother has been first rejected by Cammelli (1941, pp. 198–201), and nowadays it remains an open question (cf. Thorn-Wickert 2006, pp. 12–15).

Almost nothing is known about Manuel Chrysoloras' early life. The first mention of Chrysoloras dates back to 1386, when Demetrius Cydones makes reference to Chrysoloras' deep knowledge of Latin in a letter sent to an unidentified recipient (Thorn-Wickert 2006, pp. 33–34). Another piece of information dates back to 5 July 1388, when the Byzantine senator John Lascaris Calopherus named Manuel Chrysoloras and Demetrius Cydones as executors of his will in case they were in Venice at the time of his death; this indicates that both Cydones and Chrysoloras were soon expected in Venice. There has been considerable disagreement among the scholars about Chrysoloras' first trip to Italy. According to Thorn-Wickert (2006, pp. 36–37) and Wilson (1992, p. 8), who follow Loenertz (1950, pp. 64–65), Chrysoloras accompanied Demetrius Cydones to Venice in 1390–1391. There Chrysoloras first met Roberto Rossi (ca. 1355–1417) to whom he gave instruction in Greek. Cammelli (1941, pp. 25–29) and Setton (1956, p. 57n95) dispute Loenertz's view and along with Thomson (1966, p. 76) argue that in 1394–1395, Chrysoloras with Cydones arrived in Venice to request financial and military aid against the Turks. The diplomatic mission failed, but their presence attracted the attention of two young Florentine students of the Florentine chancellor Coluccio Salutati (1331–1406), Roberto Rossi and Jacopo Angeli da Scarperia (ca. 1360–1411), who went to Venice to meet them. Jacopo Angeli da Scarperia followed them in Constantinople (1395–1396) in his determination to study Greek under Chrysoloras, whereas Roberto Rossi returned to Florence.

In a letter on 8 March 1396, Coluccio Salutati informed Chrysoloras, who was at that time in Constantinople, that he had arranged for him to teach Greek in Florence. On 28 March 1396, Chrysoloras received the invitation of the Florentine state, also written by Coluccio Salutati, to teach Greek language and literature in Florence's highest institution known as the *Studium* (text in

Thorn-Wickert 2006, pp. 41–42). He had been initially offered an annual salary of 100 gold florins and a 10-year contract. On 11 December 1396, when his appointment as a professor of Greek at the University of Florence was announced, the final terms offered to him were an annual salary of 150 gold florins and a 5-year contract. The following autumn (probably in October), Chrysoloras and Cydones returned to Venice where they spent the winter of 1396–1397. At the end of January, Chrysoloras moved to Florence where he remained for almost 3 years (1397–1400), being one of the first Byzantine scholars who moved to Italy long before the fall of Constantinople. His *Erotemata*, a sort of text for teaching Greek grammar, dates from this period, perhaps written in the first months of his stay in Florence (Cammelli 1941, p. 83; cf. Thorn-Wickert 2006, p. 199). Chrysoloras gave his opening lecture at the Florentine *Studium* on 2 February 1397. One year later (14 March 1398), his salary was raised again, reaching 250 gold florins annually. On 31 October 1399, the onset of plague necessitated the Republic of Florence to give permission to Chrysoloras to stop lecturing temporarily at the *Studium*. In the winter of 1399–1400, Chrysoloras took shelter in Casentino, in the villa of the wealthy Florentine nobleman Palla Strozzi (1372–1462), who had taken a leading part in the negotiations regarding his appointment. Before his 5-year contract had expired, Chrysoloras' teaching activity in Florence ended officially on 9 March 1400. During his 3-year tenure at the *Studium*, he taught Greek to a small number of humanists. Among his students were the Florentine Palla Strozzi, Roberto Rossi, and Jacopo Angeli da Scarperia and, from October 1398, the Paduan teacher of arts Pier Paolo Vergerio (ca. 1370–1444/5). His most famous student in Florence was Leonardo Bruni (ca. 1370/72–1444), the apostolic secretary to four popes, the future Florentine chancellor (1427), and the official historian of Florence (Hankins 2002). Niccolò Niccoli (1364–1437) and Poggio Bracciolini (1380–1459) should not be thought of as regular students of Chrysoloras, since they took only a few courses at the *Studium* (Cammelli 1941, ch. 2; Thorn-Wickert 2006, p. 47). It is worth noting that Coluccio Salutati had never

been a student of Chrysoloras, even though he was a correspondent and an ardent admirer of him. Contrary to what is often claimed by scholars (Thomson 1966, p. 64n3; Mergiali-Sahas 1998, p. 4n18), who follow older sources (Bolgar 1954, p. 403), Carlo Marsuppini (ca. 1398/9–1453) and Ambrogio Traversari (1386–1439) could not have been Chrysoloras' students; during Chrysoloras' teaching in Florence, Carlo Marsuppini was in his early childhood, and Ambrogio Traversari had not yet arrived in Florence (Cammelli 1941, pp. 66–67; Geanakopoulou 1989, pp. 283–284; Thorn-Wickert 2006, pp. 45–47).

Chrysoloras left Florence on 10 March 1400, the day after he announced his resignation as the chair of Greek at the *Studium*. Undoubtedly the reason for his early departure from Florence was the arrival of Emperor Manuel II Palaeologus in Italy, who has left Constantinople on 10 December 1399 to visit the European courts in an attempt to secure help for Byzantium. After a quick stop in Pisa, where he met his nephew John Chrysoloras on 11 March 1400, Manuel Chrysoloras joined Emperor Manuel II Palaeologus in Pavia. From 1400 to 1403, Chrysoloras stayed in Pavia and in Milan. During this period he moved around in Lombardy trying to collect funds for the Byzantine Empire. In the same period, he taught Greek intermittently, but very little is known about his teaching activities. There are some indications (listed in Thorn-Wickert 2006, p. 55) that he offered private lessons in Pavia and in Milan, in the circle of the Duke of Milan, Giangaleazzo Visconti (1351–1402), who supported him financially during his stay in Lombardy. While Chrysoloras was still in Florence teaching Greek (1397–1400), Duke Giangaleazzo Visconti, who was Florence's hated enemy, had already invited him several times to join his court at Pavia and to teach Greek and rhetoric to the scholars of his dominions; Chrysoloras however continued to refuse the Duke's invitations until Emperor Manuel II Palaeologus visited his court to request financial assistance (Hankins 1991, p. 105). It is without doubt that Chrysoloras did not occupy the chair of Greek at the University of Pavia, given that it had been transferred to Piacenza before his arrival in Pavia, because of the plague, from 1398

to 1403; and in addition it is known that Chrysoloras never taught at the University of Piacenza (Thorn-Wickert 2006, p. 55). Chrysoloras' best and only known student, since there are no records of his tutoring from that time, was Uberto Decembrio of Vigevano (ca. 1350/1370–1427), a humanist and an influential figure in the service of Duke Giangaleazzo Visconti of Milan (Cammelli 1941, ch. 4). The first translation of Plato's *Republic* into Latin, composed by Chrysoloras and his student Uberto Decembrio, dates from this period (see below for details). After the unexpected death of Duke Giangaleazzo Visconti, in September 1402, Chrysoloras remained in Lombardy continuing his diplomatic missions until he joined Emperor Manuel II Palaeologus either in Genoa (22 January 1403) or in Venice (21 March 1403). Chrysoloras had already spent almost 6 years in Italy, when he decided to return to Constantinople accompanying Emperor Manuel II Palaeologus at the beginning of April 1403. A few months later (probably after 21 August 1403), the Italian humanist Guarino of Verona (1374–1460) went to Constantinople to learn Greek under Chrysoloras (Thorn-Wickert 2006, pp. 67–68). He stayed in Chrysoloras' house most of the time, perhaps until 1406 (Thomson 1966, p. 69). In Chrysoloras' absences from the city, due to diplomatic missions, Guarino of Verona studied with his nephew, John Chrysoloras. During the time Guarino of Verona was in Constantinople (1403–1408), he made a compendium of Chrysoloras' *Erotemata* which he also translated into Latin (Cammelli 1941, p. 84; Thorn-Wickert 2006, pp. 199–200). Guarino's Greek-Latin compendium of Chrysoloras' *Erotemata* was widely circulated in Italy in the late fifteenth century (see below for details).

Chrysoloras stayed in Constantinople in the period 1403–1407, but not constantly. He travelled twice in Italy as an imperial envoy; he was in Venice in December 1404 and early in 1406 and in Padua on 3 January 1406. We know that he was in Constantinople by the end of 1405, when he requested Pope Innocent VII (1404–1406) to be ordained in the Roman Catholic Church with permission to perform the Latin rite in Greek.

Although the permission was granted by the Roman Pope on 19 February 1406, Chrysoloras was never actually ordained. Therefore, it is uncertain if and when he formally embraced Roman Catholicism. Thomson (1966, p. 81) claims that Chrysoloras' conversion to Catholicism took place at the end of 1405, whereas Hankins (2002, p. 180) suggests the year of 1406. Thomson (1966, p. 81) further asserts that his conversion to Catholicism was perhaps sincere, but it is also possible to be seen as another diplomatic move to reconcile with the West (cf. Loenertz 1950, p. 68). Cammelli (1941, p. 141) and Thorn-Wickert (2006, p. 70), however, doubt that Chrysoloras was indeed converted to Roman Catholicism (cf. Dennis 1977, p. xxxvi).

By the end of 1407, Chrysoloras left Constantinople for the last time and moved permanently to the West where he spent the rest of his life travelling from one country to another in order to form new alliances against the Ottoman Turks and to negotiate the Union of the Churches (the Greek Orthodox Church with the Latin Catholic Church). In the course of the following years, he was appointed to a number of important diplomatic missions on behalf of Emperor Manuel II Palaeologus; from 1407 to 1410, he travelled round the courts of Europe (Italy, France, England, and Spain). Little is known about the reason for and the outcome of these diplomatic missions. In addition, there is no evidence that Chrysoloras taught Greek in the period 1407–1410. He was in Venice in December 1407 and in January 1408. According to Cammelli (1941, pp. 144–145), who draws from Leonardo Bruni's correspondence with Niccolò Niccoli (dated 16 December 1407), Chrysoloras' mission was to discuss a possible union of the two Churches with Pope Gregory XII (1406–1415), who had succeeded Pope Innocent VII. Based on other sources cited by Thorn-Wickert (2006, pp. 75–76) and Mergiali-Sahas (1998, p. 7), Chrysoloras' mission was to request financial support for the fortification of Hexamilion in Peloponnese. Later that year, on 18 April 1408, Chrysoloras was in Genoa as it is evidenced by an official document, according to which he was

granted tax exemption for buying horses (Cammelli 1941, p. 146; Thorn-Wickert 2006, p. 76). No later than May 1408, Chrysoloras arrived in Paris. His duty there was to deliver as a gift an eleventh-century illuminated manuscript (bound in gold and ivory) of Dionysius the Areopagite's writings to the royal abbey of Saint Denis on behalf of Emperor Manuel II Palaeologus (Dennis 1977, pp. xxxvi–xxxvii; Mergiali-Sahas 1998, pp. 7–8; Thorn-Wickert 2006, p. 77). The following year, in 1409, Chrysoloras travelled to London and Salisbury as attested in his *Comparison of Old and New Rome* written in 1411, where he mentions that he was in London 2 years earlier (Mergiali-Sahas 1998, p. 8; Thorn-Wickert 2006, p. 77). His presence in England is also confirmed by a letter of Emperor Manuel II Palaeologus (letter no. 55 in Dennis 1977, pp. 154–157), written sometime in 1409, in reply to Chrysoloras' discouraging report which he had probably sent to the Emperor either from England or on his way from there to Spain. Nevertheless, the reason for this mission is unknown. On 7 April 1410, Chrysoloras arrived in Barcelona in order to deliver as diplomatic gifts a series of precious relics associated with Christ's Passion to King Martin I of Aragon who died upon his arrival in Spain, on 31 May 1410; and thus it remains unclear whether Chrysoloras accomplished his mission or not (Thorn-Wickert 2006, pp. 78–80; cf. Mergiali-Sahas 1998, p. 9). The final destination of his long-lasting diplomatic mission was Bologna, which he reached after 4 May 1410 and before the end of June 1410 (Thorn-Wickert 2006, p. 82). He was sent by Emperor Manuel II Palaeologus to Pope Alexander V (26 June 1409–3/4 May 1410) who died before his arrival and succeeded by Pope John XXIII, and hence he entered the service of the newly elected Pope, in which he remained until his death. On 31 August 1410, he followed Pope John XXIII to Saint Michele in Bosco and then on 14/15 September 1410 to the castle of Saint Pietro in Bologna, where Pope John XXIII stayed until 14 November 1410 to protect himself from the plague. Chrysoloras stayed at the papal court in Bologna until April 1411, when he accompanied Pope John XXIII to Rome. In this period,

according to Cammelli (1941, pp. ch. 6), who follows older sources, Chrysoloras returned for one last time to Constantinople, sometime after 4 May and before 29 December (which is the date of a letter addressed to Leonardo Bruni written in Bologna). The reason for this trip was to deliver letters from the Pope (probably Pope John XXIII) to the Patriarch of Constantinople Matthew (1397–1410). Thorn-Wickert (2006, pp. 82–83), however, argues that it was Chrysoloras' nephew, John, who was sent to Constantinople and not Manuel himself.

In April 1411, Chrysoloras accompanied the papal curia from Bologna to Rome, where he stayed for 2 years, until 1413, in an effort to promote the Union of the Churches and to receive financial and military assistance for Byzantium. While in Rome, Chrysoloras taught Greek in private to the humanists Cencio de' Rustici from Rome (ca. 1390–1445), the official historian of the Roman curia, and Bartolomeo Aragazzi from Montepulciano (after 1350–1429), the papal secretary of John XXIII (Thorn-Wickert 2006, pp. 91–95). Nevertheless, there was nothing on the scale of the widespread enthusiasm that Chrysoloras encountered in Florence in 1397 (Cammelli 1941, pp. 154–155). The available main body of his correspondence dates from this period, including his three famous letters addressed to Emperor Manuel II Palaeologus which is widely known as the *Comparison of Old and New Rome* (text in PG 156: 23–53; cf. no. 6 in Thorn-Wickert 2006, pp. 223–229); to his nephew John Chrysoloras (text in PG 156: 53–58; cf. no. 7 in Thorn-Wickert 2006, pp. 229–230); and to Demetrius Chrysoloras (text in PG 156: 57–60; cf. Baxandall 1965, pp. 197–199; no. 8 in Thorn-Wickert 2006, pp. 230–231). In these letters Chrysoloras deals with the physical beauty of Rome, providing a theoretical basis of the Byzantine aesthetics. From the same period are also his letters to Palla Strozzi and Guarino of Verona (nos. 9–11, 14 in Thorn-Wickert 2006, pp. 231–236, 240–242). It is not yet clear whether Chrysoloras was in Rome or in Florence, when he addressed a letter to Ambrogio Traversari about friendship (Cammelli 1941,

p. 181; cf. no. 13 in Thorn-Wickert 2006, pp. 237–240).

On 8 June 1413, Chrysoloras left Rome following Pope John XXIII to Florence, where he stayed for a few months. On 6 September 1413, he was sent by Pope John XXIII, together with the cardinals Antoine de Challant (ca. 1350–1418) and Francesco Zabarella (1360–1417), to the king of Hungary and the future Holy Roman Emperor Sigismund (1433–1437), whom they met in Tesserete (north of Lugano) on 13 October 1413, in order to determine a suitable location for the forthcoming ecumenical Church Council regarding the Union of the Churches and the Great Western Schism which divided the Roman Catholic Church for almost 40 years, from 1378 to 1417, when there were two, and later three, rival popes: Pope Gregory XII (1406–1415) in Rome and antipopes Benedict XIII (1394–1417) in Avignon and John XXIII (1410–1415) in Pisa. After the mission ended, Chrysoloras rejoined the papal curia either first in Florence and then in Bologna or direct in Bologna, where Pope John XXIII arrived on 25 February 1414 (Cammelli 1941, p. 163; Thorn-Wickert 2006, p. 101). His *Discourse to the Emperor Manuel II Palaeologus* dates from his sojourn in Bologna (see below for details).

In the middle of July 1414, Chrysoloras left Bologna and, in company with Guarino of Verona, travelled to Venice; the reason for this journey is unknown. In the late summer or early autumn of 1414, Chrysoloras may have visited Emperor Manuel II Palaeologus in Thasos or in Thessalonica (Loenertz 1950, pp. 70–71; Dennis 1977, p. xxxvii; cf. Thorn-Wickert 2006, pp. 104–105). According to Cammelli (1941, pp. 163–164), however, Chrysoloras, after visiting Venice, returned to Bologna and from there departed with the papal delegation on 1 October 1414 for the Council of Constance, the proceedings of which he attended from the start as representative of the Greek delegation. It is undeniable that Chrysoloras travelled to Constance in the autumn of 1414, albeit it is disputable whether or not he accompanied Pope John XXIII, who arrived in Constance on 28 October 1414 (Loenertz 1950, p. 71; Thorn-Wickert 2006,

p. 107). What is certain is that Chrysoloras participated in the Council of Constance (1414–1418), which ended the Great Western Schism with the election of the new Pope, Martin V, in November 1417. Chrysoloras' death occurred a few months after the Council of Constance had begun, on 15 April 1415; he died from high fever and was buried in the Dominican convent. From Pier Paolo Vergerio's funeral oration on Chrysoloras (text in Thorn-Wickert 2006, pp. 118–119; cf. Cammelli 1941, pp. 167–168), we learn that Chrysoloras' presence at the Council of Constance was so dominant that he was considered as one of the possible candidates for the papal throne. This is also demonstrated by Guarino of Verona's letter addressed to Jacopo de Fabris (on 1 July 1416), as well as by Battista Guarino's letter addressed to his father Guarino of Verona (Cammelli 1941, p. 166; Thorn-Wickert 2006, p. 115).

Innovative and Original Aspects

For teaching Greek language in the Florentine *Studium*, Chrysoloras composed a grammar under the typical Palaeologan title *Erotemata* (*Ἐρωτήματα*) which means *Questions*. This however was not modelled on the traditional Byzantine type of grammar manuals, since it provided a simplified and abridged grammar of Greek. As Wilson (1992, p. 9) notes, a comparison of Chrysoloras' *Erotemata* with Manuel Moschopoulos' *Erotemata* (fourteenth century) reveals that the categories of the noun have been reduced from 56 to 10. Chrysoloras' success in teaching Greek lays in his innovative approach to the theoretical system of Greek grammar, in particular the noun declensions (Nuti 2012, p. 241; cf. Thorn-Wickert 2006, pp. 190–199). His *Erotemata* was written in question-and-answer form, containing examples of sentences but no texts for reading, and it was soon abbreviated and translated into Latin by Guarino of Verona. Both versions were originally used in manuscript; Chrysoloras' *Erotemata* is preserved in more than a hundred manuscripts, and Guarino's Greek-Latin compendium survives in at least 30 manuscripts. It is noteworthy that Guarino's

compendium was printed several times before Chrysoloras' *Erotemata* appeared in print in its original form by Lorenzo de Alopa in Florence in 1496, which was once thought to be the editio princeps. From 1475 to 1491, the Guarinian compendium was printed five times: three in Vicenza (1475, 1490, 1491), one in Parma (1481), and one in Venice (1484). At the same period dates one more edition; in 1471, Adam of Ammergau/Ambergau, one of the earliest European printers in Italy (Venice), issued an abridged Latin version of Chrysoloras' *Erotemata* whose author has not yet been identified, albeit it seems unlikely to be Guarino (Thorn-Wickert 2006, pp. 200–201). Moreover, Chrysoloras' *Erotemata* had been more useful than other traditional Greek grammars distributed throughout the West, such as those of Constantine Lascaris' and Manuel Moschopoulos', given that it was the first Greek grammar provided with a Latin translation (Geanakopoulos 1962, p. 286). From the fifteenth century until the sixteenth century, Chrysoloras' *Erotemata* was widely circulated in numerous manuscripts (in various long and short versions) as well as in multiple printed editions and reprints, including those of Aldus Manutius' in Venice in 1512, Demetrios Ducas' in Spain in 1514, and Zacharias Calliergis' in Venice around 1520–1522 (Geanakopoulos 1962; Thorn-Wickert 2006, pp. 199–205; Rollo 2012, ch. 2; Nuti 2012).

Chrysoloras left no account of his teaching methods. All the details known are drawn from the testimonies of his students: Leonardo Bruni's treatise entitled *De studiis et litteris* (ca. 1425) which was the first exposition of Chrysoloras' pedagogic technique; the correspondence of Guarino of Verona and Cencio de' Rustici; and Battista Guarino's famous treatise on education, *De modo et ordine docendi et discendi* (ca. 1459), in which he outlined his father's teaching methods, Guarino of Verona, that were adopted by his teacher Chrysoloras (Cammelli 1941, ch. 3; Thomson 1966, p. 67; Wilson 1992, pp. 9–12). Chrysoloras method of teaching Greek could be summarized as follows. In the beginning he taught vocabulary and grammar, emphasizing the importance of constant revision and regular discussion

of subject matter as the most effective ways of learning: a method of learning that has already been in use in scholarly circles of Florence. When his students possessed a good knowledge of Greek, he taught original texts of ancient authors, focusing on the correct pronunciation, on the use of mnemonics, and on the thorough study of a text with emphasis on *methodice* (vocabulary, grammar, syntax) and *historice* (the historical context of the text) (Thomson 1966, p. 67). In the early stages, they were introduced to prose authors writing history, biography, oratory, and moral philosophy, such as Lucian and Xenophon; in the advanced stages, they were instructed in poetry (starting from Homer), tragedy, and comedy. The favorite authors of Chrysoloras and his students were Plutarch, Demosthenes, Xenophon, Plato, Aristotle, Lucian, and Claudius Ptolemy (Hankins 2007; cf. Wilson 1992, p. 10). Hankins (2007) points out that Chrysoloras' practice of studying prose before poetry is one that has lasted down to modern times in Western educational practice.

Another important aspect of Chrysoloras' teaching process is that he introduced a new method for translating Greek texts into Latin. He was opposed to the well-known *ad verbum* translation, namely, a literal translation word by word, as well as to a free translation. Both practices of translation were inadequate and could entirely falsify the meaning of the original text; an *ad verbum* translation could not preserve the author's style of writing, and an overly free translation could lead to a commentary. Chrysoloras suggested rendering a passage according to the sense, but without changing the textual nuances. His method of translation into Latin is known as *transfere ad sententiam* (transfer to thought), and it was followed by all his students, particularly by Leonardo Bruni and Uberto Decembrio (Cammelli 1941, pp. 88–92; Geanakopoulos 1989, p. 10; Wilson 1992, pp. 11–12). Furthermore, while Chrysoloras was teaching Greek at the Florentine *Studium* (1397–1400), he began to translate Plato's *Republic* and Ptolemy's *Geography* into Latin for teaching purposes; nonetheless, both translations were completed later. Chrysoloras translated the *Republic* in collaboration with his student in Pavia Uberto Decembrio;

the philological part of the translation was almost certainly done by Chrysoloras and the style improved by Uberto Decembrio. The first Latin translation of the *Republic* was published before the summer of 1402; being an unsatisfactory translation, with an abundance of errors and omissions, it was later corrected by Uberto Decembrio's son, the eminent Milanese humanist Pier Candido Decembrio (1399–1477), who may have taught himself Greek in the early 1930s from Chrysoloras' *Erotemata* (Hankins 1991, pp. 105–153, esp. p. 108; cf. Cammelli 1941, ch. 4; Thorn-Wickert 2006, pp. 57–60). The Latin translation of Ptolemy's *Geography* was completed in 1409/1410 by Chrysoloras' student – first in Constantinople (1395–1396) and then in Florence – Jacopo Angeli da Scarperia, who was encouraged by Cardinal Peter Filargis of Candia (later Pope Alexander V of Pisa) to revise and complete Chrysoloras' version for publication; Jacopo Angeli da Scarperia's translation was circulated under the title *Cosmographia* (Geanakopoulos 1989, p. 10; Hankins 2003, pp. 457–459; cf. Gentile 1992).

Chrysoloras' best known work is a lengthy letter written in Rome in 1411 (in April or later but before October) and addressed not to the future Emperor John VIII Palaeologus (1425–1448), son of Emperor Manuel II Palaeologus, as it was widely held in the past (Cammelli 1941; Dennis 1977, pp. xxxvii), but to Emperor Manuel II Palaeologus himself (Rollo 1999, pp. 77–78; cf. Crisolora 2001, p. 13; Thorn-Wickert 2006, p. 223). It bears the title *Σύγκρισις τῆς παλαιᾶς καὶ νέας Ρώμης* (*Comparison of Old and New Rome*), and it is also known in the secondary literature by its abbreviated form as *Synkrisis* or *Syngrisis*. In the first part of his *Synkrisis*, he provides a detailed description of architectural and sculptural monuments of Ancient and Christian Rome (Smith 1992; Webb 2012); in the second part, he makes a systematic comparison between Rome and Constantinople which he regards as the new Rome (Crisolora 2000, 2001, pp. 13–25). Chrysoloras' purpose in this letter was to promote good relations between the East and the West by showing that these two cities, Rome and Constantinople, share a common bond which is nothing other than their cultural heritage dating

back to Greco-Roman antiquity (Thomson 1966, p. 70; Mergiali-Sahas 1998, p. 2). His letter is highly rhetorical in both style and structure, and it represents a fine example of the Greek rhetorical tradition (Webb 2012, pp. 127–131). Chrysoloras' *Synkrisis* was successfully distributed throughout Northern Italy by his devoted student Guarino of Verona, who had received a copy of the letter from him in October 1411 (Thomson 1966, pp. 69–70; cf. letter no. 10 in Thorn-Wickert 2006, pp. 233).

Chrysoloras' longest and probably most significant work is a discourse addressed to Emperor Manuel II Palaeologus, written in Bologna in 1414, between 25 February and 15 July (Patrinelis 1972). Since the first folio of the sole extant manuscript is missing, the title *Λόγος κατ' ἐπιστολὴν περὶ τοῦ βασιλέως λόγου* (*Discourse to the Emperor Manuel II Palaeologus*), which is found in the literature, was created by its editors, Patrinelis and Sofianos (see Chrysoloras 2001, p. 50). His *Discourse* was composed at the request of Emperor Manuel II Palaeologus (letter no. 56 in Dennis 1977, pp. 158–160), and its original purpose was to improve the funeral oration which the Emperor had written for the second anniversary of his brother's death, the Despot of Morea Theodore I Palaeologus (Chrysoloras 2001, pp. 38–39, 44–48; cf. no. 15 in Thorn-Wickert 2006, pp. 242–245). The *Discourse* is divided into two main sections. In the first part, which is the largest, Chrysoloras discusses the funeral orations as a literary genre, and then he eulogizes the deceased Despot Theodore I Palaiologos and comments extensively on the Emperor's funeral oration in a laudatory tone. In the second part, consisted of four paragraphs and written as an addendum, Chrysoloras expresses his deep concern about the growing Ottoman threat, and he proposes a series of educational reforms based on a revival of the Greco-Roman heritage that would prevent the imminent collapse of the Byzantine Empire (particularly in the first two paragraphs). Chrysoloras advocated the promotion of education (establishments of schools, support to scholars, and a systematic study of the literary corpus of the Greco-Roman antiquity) as a measure for the salvation of Byzantium, and he underlined the twofold lineage of its citizens; he was one of the first exponents of the racial

identification of the Byzantines with the Greeks and Romans. Therefore his conception of Byzantium as being the cultural and political continuity of both Greek and Roman Antiquity is of great importance (Patrinelis 1972, pp. 500–502; Chrysoloras 2001, pp. 48–52).

Apart from the four works mentioned above (the *Erotemata*, the first Latin translation of Plato's *Republic*, the *Synkrisis*, and the *Discourse*), Chrysoloras translated the Liturgy of the Roman Catholic Church into Greek and plausibly composed a pro-Latin theological treatise on the procession of the Holy Spirit (Cammelli 1941, p. 178). Chrysoloras' correspondence should also be included in his writings, being rhetorical and literary in character; besides the letters addressed to Emperor Manuel II Palaeologus (the *Synkrisis* and the *Discourse*), 13 letters are known to be extant today (listed in Cammelli 1941, pp. 180–182 and in Thorn-Wickert 2006, pp. 217–245), 2 of which are written in Latin (those addressed to Pope Innocent VII and to Uberto Decembrio). He engaged in correspondence with his relatives and his friends, as well as with many of his students. Among his correspondents were prominent humanists of the early Quattrocento, eminent ecclesiastical figures, and leading personalities.

Impact and Legacy

Chrysoloras had a significant impact on the revival and the development of Greek studies in the Italian Renaissance. He introduced the *transfere ad sententiam* method for translating Greek texts into Latin which was followed by the Italian humanists. Chrysoloras' students contributed significantly to the dissemination of Greek culture in the Latin West. They became distinguished translators of Greek literature as well as teachers of Greek language. Leonardo Bruni produced influential translations of Greek authors (mainly of Plato's dialogues); Uberto Decembrio, Cencio de' Rustici, and Jacopo Angeli da Scarperia also engaged in the translation of Greek texts; Palla Strozzi and Pier Paolo Vergerio taught Greek at the Florentine *Studium* and introduced the teaching of Greek at Padua; Roberto Rossi founded a

Florentine center of Greek and Latin studies; Guarino of Verona established the first humanist school in Venice, in which the study of Greek literature was an essential part of the curriculum, and he promoted the pedagogic technique of his teacher (Cammelli 1941; Thomson 1966; Geanakopoulos 1989; Hankins 2007).

Ciceronianism

Fosca Mariani Zini
 University of Tours, Tours, France
 Department de Philosophy, Centres d'Etudes
 Supérieures de la Renaissance, Université
 François Rabelais, Tours, France

Abstract

The force of Ciceronian discourse does not only depend on its clarity, but also on its masterly usage of multiple registers and styles, according to the circumstances and the literary

genre. Therefore, Cicero seems to be an author who difficulty lends himself as a united model of writing and thinking. Nonetheless, this is exactly what happened during the Renaissance. The term Ciceronianism dates back to the nineteenth century and signifies an important trend among the Humanists who were looking to imitate Ciceronian writing, understood as the norm of correct Latin. In this regard, Erasmus of Rotterdam's (Rotterdam, 1467–Basel, 1536) reaction, in his fictional dialogue *Ciceronianus* (1528), was extremely violent. It is a satirical dialogue that dramatizes three figures: Bulephorus, who represents Erasmus, Hypologus, who asks the questions, and Nosoponus, who embodies the unconditional follower of Cicero. But Erasmus' criticism is of a literally and theological nature. From a literary point of view, he denounces the pedestrian imitation of Cicero. The only true Cicero, as Erasmus point out, was Cicero himself. From a theological point of view, the faithfulness to Cicero, as well as the cult of the vocabulary of Latin culture, distorted the Christian spiritual message. The only veritable imitation must be, for Erasmus, the imitation of Christ. Even the title of *Ciceronianus* text takes up Saint Jerome's letter 22, in which he opposes the fact of being *ciceronianus* to the fact of being *christianus*.

Heritage and Rupture with Tradition

Marcus Tullius Cicero (Arpino, -106/Formia, -43) was a coherent author, although manifold. Politician, lawyer, and philosopher in Rome, he wrote just as well treatises in rhetoric, such as the *De Oratore*, as moral essays, on the therapy for the soul and the definition of goods and evils, such as the *Tusculanes*, the *De Officiis*, as well as numerous speeches and discourses. As a lawyer in ancient Rome, Cicero was able to plead in a variety of trials and cases: corruption, murder, inheritance, fraud, etc. Numerous were his victories. His extraordinary intelligence, his persuasive ability, and his rhetorical talent were celebrated by his contemporaries, both friend and enemy. Such

renown has spanned the ages with a rare consistency in the history of culture.

However, the force of Ciceronian discourse does not only depend on its clarity, but also on its smart practice of multiple styles, according to the circumstances and the literary genre. Moreover, Cicero looked to establish a philosophical language in Latin, this is why he did not limit himself to translating Greek terms, but rather invented novel Latin terms, complaining of the poverty of the Greek language. At the level of contents, his writing was equally varied. It is not a matter of a versatile attitude, but of the claim, on his own behalf, of his affiliation to a specific philosophical school, the Academy. Cicero constantly defined himself as *academicus*, a partisan following the school that had stayed faithful, after Plato's death, to Socratic doubt. It is not so much a radical skepticism, but rather the expression of doubt concerning any form of certainty: every subject, in philosophy, in politics, in morality, in jurisprudence, is controversial. Only an argumentation *in utramque partem* (which weighs the arguments for and against every time) can determine a credible and plausible conclusion, because the interrogation is never closed once and for all.

Therefore, Cicero seems to be an author who difficulty lends himself as a unified model of writing and thinking. Nonetheless, this is exactly what happened during the Renaissance. The term Ciceronianism dates back to the nineteenth century and signifies an important trend among the Humanists who were looking to imitate Ciceronian writing, understood as the norm of correct Latin. At first sight, it is a matter of a stylistic quarrel, which implies however a deep disagreement about the idea of language and of culture. The dispute between Paolo Cortese (Rome, 1465–1510) and Angelo Poliziano (Montepulciano, 1454–Florence, 1494) during the fifteenth century is, in this respect, significant. Cortese considers that Cicero is the only model of writing for Neo-Latin culture. Poliziano, on the contrary, asserts that such a conception of imitation would make us similar to parrots. If the ancient culture must be a model for any imitation, this must not be understood in a servile manner, because the exclusivity of the paradigm is a form

of impoverishment. Moreover, the ancient tradition provides a variety of forms, of solutions, and of authors, that must be read and assimilated by the new humanist writers.

Innovation and Original Aspects

Behind these remarks hides a specific idea about language and culture. Poliziano, who wrote in three tongues (Greek, Latin, and Vernacular), is aware that all language has its own historical development, so that the Latin of Cicero cannot be taken back up because the idiom itself is no longer the same, and no longer has the same significance. Therefore, it is necessary to follow new paths, even though in the footsteps of the Ancients. As a grammarian and philologist, Poliziano endorses the position of Crates of Mallus (the ancient librarian of Pergamum) against Aristarchus (the librarian of Alexandria). Language is not an immutable system of rules, whose irregularities can be resolved by recourse to analogy, but rather a composite field, characterized by accumulation, variety, and anomalies. There are changing rules, so Cicero cannot be the unique model of all Latin writing; this approach is foreign to the living practice of the language.

In this respect, Pietro Bembo (Venice, 1470–Rome, 1547) supported an opposite conception. In his letter *De Imitatione* (“On Imitation,” 1512), he criticizes the eclectic style and the multiple references of the prose of Giovanni Pico della Mirandola (Mirandola, 1469–1533), who had reprised Poliziano's conception. For Bembo, it is necessary to adopt a unique model of writing according to the literary genre: Cicero for prose, Virgil for poetry. The same point of view is assumed in the *Prose della volgare lingua* (“Prose of the Vernacular Language,” 1525): here Bembo is looking to set up grammatical criteria for literature in the vernacular language (actually Tuscan). The unique models must be Petrarch for poetry and Boccaccio for prose, just as Virgil and Cicero were for Latin writing. On the contrary, the language of Dante is criticized as

trivial because it is too close to the insignificant things in life.

In fact, Pietro Bembo, the Secretary to Pope Leo X, was at the head of an intellectual circle that professed a profound cult for ancient Roman culture, notably for Cicero, as a stylistic model. Within this circle were Jacopo Sadoleto (Modena, 1477–Rome, 1547) and the Franco-Flemish humanist Christophe de Longueil (Malines, 1488–Padua, 1522), a highly contrasting figure, who had started by criticizing the cult of Latinity and then was conquered by Bembo's Ciceronian ideas. So the necessity of using Ciceronian and Virgilian turns of phrase was maintained in order to compose hymns to the Saints or in order to translate the Bible.

Impact and Legacy

Against such an attitude, Erasmus of Rotterdam's (Rotterdam, 1467–Basel, 1536) reaction was violent. He wrote the fictional dialogue *Ciceronianus* (1528). It is a satirical dialogue that dramatizes three figures: Bulephorus who represents Erasmus, Hypologus, who asks the questions, and Nosoponus, who embodies the unconditional follower of Cicero in a pedantic manner. From a literary point of view, Erasmus denounces the slavish imitation of Roman philosopher by adopting her own criteria. The contemporaries who recognized themselves in this portrait were appalled. The only true Cicero was, for Erasmus, Cicero himself. From a theological point of view, Erasmus blamed the pagan attitude of the papal court. The faithfulness to Cicero, as well as the cult of the vocabulary of Latin culture, denies the simplicity of the Christian spiritual message. Even the title of *Ciceronianus* text takes up Saint Jerome's letter 22, in which he opposes the fact of being *ciceronianus* to the fact of being *christianus*. However, we can suggest that these oscillations characterize Erasmus' writing.

The erudite public recognized either Pietro Bembo or Christophe de Longueil behind the figure of Nosoponus, so that a fierce polemic followed. Giulio Cesare Scaligero (Riva del Garda, 1484–Agen, 1558), an Italian philologist

and a specialist in the Latin language who had immigrated to France, wrote a defense of Longueil entitled *Oratio pro Cicerone contra Desiderium Erasmum* ("Speech for Cicero against Erasmus" 1531–1537) and Etienne Dolet wrote a significant pamphlet: *Erasmianus* against *Ciceronianus* (1535). In a much drastic way Guillaume Budé (Paris, 1467–1540) broke any relationship with Erasmus,

A more interesting use of Cicero's works was the commentary of his speeches before the court, in which the humanists appreciated the civil and political engagement of the orator. If the imitation of the Ciceronian speeches progressively became a repetitive pedantic exercise, it was, at its start, an effective model of argumentation in order to formulate credible and plausible arguments in the circumstances of an active life. In this respect, around 1390, Antonio Loschi (Vicenza, 1368–1441) wrote a commentary of 11 Ciceronian orations, analyzing as much the argumentation as the style. The enthusiasm for Cicero's orations was very strong in the fifteenth and sixteenth centuries, when for example, Guarino Guarini (Verona, 1370–Ferrara, 1460) commented the *Pro Roscio Oratio* and Rudolph Agricola (Bafflo, 1443–Heidelberg, 1485) examined the arguments of the *Pro Milone Oratio*, which was one of the most commented texts in the history of ciceronian tradition). However, the most significant author was the Byzantine George of Trebizond. For Trebizond (Crete, 1395–Rome, 1484) in his *Rhetoricorum libri V* ("The Five Books of Rhetoric" 1433–1444), rhetoric is essentially a political discipline, detached from philosophical speculation and moral obligations. A political speech must be effective, in the sense that it must convince the public. Cicero's orations therefore offer the best living model of the link between politics and rhetoric. This is why, Trebizond commented the *Pro Ligario Oratio*, in which Cicero defended, with an unhoped-for success Ligarius, who had been accused of high treason with regards to Caesar. The trait is significant: Cicero had equally been one of Pompey's supporters against Caesar. The orations in favor of exiles, partisans of Pompey, were the occasion for Cicero, sidelined from political power after

Caesar's victory, of developing the peace after the civil war.

After all, a substantial change took place between the Middle Ages and Humanism. In the Middle Ages, Cicero was considered above all a *magister* of dialectic, thanks to his rewritings of Aristotle's *Topics*, which were commented by Severinus Boethius. He was equally read as a moral philosopher, as much by Albert the Great as by Thomas of Aquinas, thanks to his interrogation of the true happiness. In the Renaissance, the necessity of elaborating an effective rhetoric in political, juridical, and social conflicts led to considering Cicero as a model of eloquence.

Circulation of Blood in Renaissance Medicine

Fabio Zampieri, Alberto Zanatta and Gaetano Thiene
 Department of Cardiac, Thoracic and Vascular Sciences, University of Padua Medical School, Padua, Italy

Abstract

From the antiquity to the Renaissance, the heart was figured as a container, rather than a pump of blood. Galen's system hypothesized that blood was produced in the liver and that some amount of it passed from the right to the left ventricle through invisible pores. Since the rediscovery of human anatomy in the Renaissance, all Galenic dogma around cardiovascular anatomy and physiology were gradually discredited. Andreas Vesalius denied the patency of interventricular septum. Matteo Realdo Colombo proved that blood passed from the right to the left ventricle through the lungs (pulmonary circulation). William Harvey, basing on Hieronymus Fabricius' finding of valves in the veins and on Aristotle's concept of circular movement, discovered blood systemic circulation and demonstrated that heart was a pump, rather than a simple container, or vase, of blood. Harvey's concept of the heart as a pump and his quantitative and experimental method influenced seventeenth- and eighteenth-century medicine, which was characterized by a mathematical and mechanical approach to living creatures.

Heritage and Rupture with the Tradition

The discovery of blood systemic circulation has a long history, even though the complete

understanding of cardiovascular physiology arrived only in modern times, while all antiquity and middle ages were characterized by a totally different conception of the structure and function of the heart and blood vessels.

Since the Egyptian medicine (3500 BC), the heart was believed to be the center of the organism and the site of human passions, will, and intelligence. Morphologically and physiologically, it was considered a vase or container from which a system of channels transported throughout the body, blood, feces, semen, benign and malignant spirits, and even the soul (the *metw*) (Wilson 1962; Nunn 1996). The fundamental idea that the heart was a vase, rather than a pump, characterized in some way all ancient cardiovascular physiologies. The main synthesis arrived with Galen of Pergamon (129–217 AD). According to him, the right atrium and ventricle of the heart were the sites in which blood arrived through the vena cava, after having been produced by the liver. Then, pushed by the continual arrival of new blood, it was distributed through the veins to other organs and tissues of the body (to the lungs it arrived by pulmonary arteries), where it was continuously consumed and replaced by new blood (Nutton 2004). Because of its ability to conciliate elements from Platonic and Aristotelian philosophy and Hippocratic and Alexandrine medicine, Galen system persisted almost unvaried until the whole Renaissance (Singer 2014; Hankinson 2008). Moreover, the finalistic approach at the base of his medical and philosophical view, according to which any biological feature was perfectly designed by the wisdom of the creator, represented the crucial feature of its fully integration in the scientific and philosophical orthodoxy of Christianity. An integration that turned his medicine in a dogmatic system which endured, in some of its aspects, even until the XIX century.

Innovative and Original Aspects

One of the central dogmas of Galen's cardiovascular anatomy and physiology was the patency of interventricular septum. His system, in fact, presumed that some blood passed from the right to

the left ventricle, where it was mixed with air coming from the lungs through pulmonary veins for the creation of the vital spirit, one of three fundamental spirits in psychosomatic functions (Temkin 1951; Donini 2008). From the late fifteenth century, through a more rigorous philological approach to Galen's corpus and an even more diffused practice of dissection, the ideal conditions were established for physicians' emancipation from Galen dogmatic system (Landucci Ruffo 1981). The first step for rethinking this system was done at the peak of Renaissance rediscovery of human anatomy, thanks to the work of Andreas Vesalius (1514–1564). Vesalius, professor of anatomy at the University of Padua (1537–1543), revolutionized the study and teaching of human anatomy because he was the first to base his research exclusively on his own dissections and observations on human cadavers. Thanks to his new empirical approach, which had an important influence also on Renaissance and modern philosophy and epistemology (Cassirer 1943), Vesalius could prove, in his famous *De humani corporis fabrica*, that septal interventricular pores did not exist (Vesalius 1543). In the second edition of the *Fabrica*, Vesalius claimed that this discovery forced him to rethink cardiovascular physiology, even if he was not able to propose any new theory (Zampieri et al. 2014; Vesalius 1555). Matteo Realdo Colombo (1516–1559), student and for some time successor of Vesalius at the chair of anatomy of the University of Padua, pursued his studies, discovering (and experimentally proving by vivisection) pulmonary circulation, that is, the transit of blood from the right to the left ventricle through the lungs (Elmaghawry et al. 2013; Ongaro 1971; Colombo 1559). Another Padua professor of anatomy contributed decisively to the discovery of blood systemic circulation by William Harvey (1578–1657) in 1628 (Harvey 1628): Hieronymus Fabricius ab Aquapendente (1537–1619). He was professor of Harvey during Harvey's stay in Padua (1599–1602). Exactly in this period, Fabricius discovered the valves in the veins (Fabricius ab Aquapendente 1603), which gave to Harvey a pivotal insight to think about the centrifugal distribution of blood in the body. Interestingly, both Fabricius and Harvey were admirers

of Aristotle. In the introduction of his revolutionary *Exercitationes de generatione animalium*, Harvey mentioned Aristotle as his “general” and Hieronymus Fabricius as his “guide” (Harvey 1651). From Aristotle, Harvey took the idea that the perfect movement in nature was the circular one. He hypothesized that this kind of movement should exist also in the human body, because it was a microcosm reflecting the same laws and functions of the macrocosm (Zampieri et al. 2013).

Impact and Legacy

The discovery of blood circulation revolutionized not only medicinal theory and practice but also epistemology. Harvey used a quantitative and experimental argument for denying Galen’s centripetal theory of blood distribution (from the liver to the organism without return). He estimated the volume of blood passing through the left ventricle in half an hour (about 12 k, or 26 lb), clearly indicating that the liver was unable to produce so much blood in such a short period of time. Only a close circulatory system could keep it constant. This mathematical approach and the concept that the heart was a pump influenced seventeenth- and eighteenth-century physiology, which was developed through a mechanistic approach. Marcello Malpighi (1628–1694) discovered capillary vessels (Malpighi 1661) and Thomas Bartholin (1614–1680) gave the first complete description of the lymphatic system (Bartholin 1653), thus closing the circle of cardiovascular system understanding.

Cities and Urban Life, Renaissance

Caspar Pearson
University of Essex, Colchester, UK

Abstract

At the time of the Renaissance, Europe was already heavily urbanized. The Middle Ages had witnessed an extraordinary period of city building in which many new settlements were founded. During the Renaissance, this activity dramatically slowed. However, the Renaissance did give rise to new ways of considering the city and to new discourses regarding urban life. These included innovative forms of city description and the birth of the modern architectural treatise, something that, arguably, also initiated the modern discourse of urbanism. Simultaneously, there were multiple developments in the visual representation of the city, with the genre of city views becoming increasingly popular throughout the sixteenth century. Renaissance thinkers of various kinds concerned themselves with the ideal city, formulating schemes that ranged from the practical to the unrealizable. While these projects frequently remained unbuilt, colonialism did give rise to new city building in other continents – particularly “Spanish America” where the grid became more or less ubiquitous. Among the small urban projects that were executed in Europe, some have continued to exert enormous influence on discussions of urban planning. For example, the Tuscan city of Pienza – a hilltop village that was given a new central piazza, a cathedral, and a number of other monumental buildings in the fifteenth century – continues to be held up as a model for development by urbanists adhering to a

variety of different views. Meanwhile, the works of the architectural treatise writers of the period are still regarded by many as foundational documents for the theory and practice of urbanism.

Cities and Urban Life

By the middle of the fourteenth century, the European network of cities was mostly complete (de Vries 1989). Medieval builders had consolidated what survived from the urban legacy of antiquity, incorporated the formerly Moorish cities of Sicily and the Iberian Peninsula into a broader Christendom, and founded over 1,000 new towns (Benevolo 1993). To this day, the distribution of cities across the continent largely conforms to the medieval pattern. This extraordinary period of urban growth did not continue into the Renaissance. The Black Death of 1348 ushered in a century of economic and demographic decline during which few new cities were built. Simultaneously, political changes, particularly in the heavily urbanized peninsula of Italy, saw the widespread collapse of communal governments and their replacement by seignorial regimes. Nonetheless, the urban population remained stable, bolstered by immigration from rural areas, and the life of the cities continued (de Vries 1989).

The Renaissance inherited not only the medieval city network but also a powerful urban imaginary populated with what might be termed “cities of the mind.” Of these, Rome and Jerusalem were the two most important, just as they had been in the Middle Ages. However, where medieval Christians seriously entertained the idea of occupying Jerusalem (and succeeded briefly in doing so), this prospect sharply receded in the Renaissance, notwithstanding frequent fifteenth-century calls for a new crusade. Increasingly difficult to access, Jerusalem – which always occupied an unstable position as both a lamentably flawed earthly city and a longed-for spiritual paradise that would appear at the close of history – retained its place in the religious imaginary, even as the actual city slipped from view. While it often stood at the center of medieval *mappae mundi*, the

discovery of the Americas and the development of new forms of cartographic projection displaced Jerusalem from the center of the map. By the time of Gerardus Mercator's famous world map of 1569 – a landmark in the establishment of the modern world's cartographic image – Jerusalem had to take its place as one city among many. Pilgrimage to the city was sometimes replaced with visits to substitutes such as the “sacred mountain” established above the Italian hill town of Varallo in 1491, where the Jerusalem pilgrimage route was recreated (Siew 2015).

Rome, by contrast, continued to draw pilgrims to its holy sites and tourists to its ancient wonders. Abandoned by the papacy for the majority of the fourteenth century and left without stable government during the papal schism, the entry of Martin V into the city in 1420 initiated a long and often faltering period of urban transformation. From Martin's reestablishment of the *maestri della strada* (Masters of the Streets) to Sixtus V's major reorganization of the city in the 1580s, Rome was gradually converted from an anarchic and depopulated backwater into the impressive seat of a major spiritual and political power – albeit one that was proven by the Sack of 1527 to be militarily defenseless (Ackerman 1982; Frommel 1986; Kostof 1995; Taylor et al. 2016). Rome's ancient ruins, often repurposed or mined for building materials, continued to inspire wonder in visitors and stimulated humanist writers to ponder both the collapse of a great urban civilization and the manifest differences between contemporary cities and those of antiquity. Humanists were often painfully aware that ancient Rome exceeded the urban society of their own times according to almost every measure. In Roman literature and particularly the works of writers from the late Republican period such as Cicero, they found a rich source of thinking about the res publica that offered a fertile stimulus for their own works.

Depending on the observer, Rome might exceed expectations, as it did for Petrarch (2008), or fall horribly short of them, as it did for Luther among others (Marius 1999). The desire to achieve a full architectural understanding of the ancient city, as articulated in a famous letter

written by Raphael and Baldassare Castiglione to Pope Leo X, remained constant throughout the sixteenth century, spurring the activities of many architects and architectural treatise writers, artists, mapmakers, historians, and topographers (Shearman 2003). The comparison between ancient and modern Rome was a staple of both literary and visual descriptions of the city (Fall 2012). Like Jerusalem, Rome was thus always essentially “double” – ancient and modern, pagan and Christian, real and ideal – creating a gap in which desire thrived and creativity flourished.

Such was the length of Rome's shadow that many cities styled themselves as new Romes in order to enhance their status in the eyes of the outside world. Cities could be troublesome entities for the larger territorial powers that often sought to control them. Whether in the hands of a local aristocracy, a communal government, or a despotic regime and whether existing as city-states or simply as cities within a larger state, cities regularly aspired to a degree of autonomy that the kingdoms, imperial lands, and papal dominions with which they rubbed shoulders found intolerable. In an age in which monarchy was routinely considered the most natural and legitimate form of government, the cities had long bolstered their own claims to legitimacy by pointing to illustrious founders who ranged from Roman emperors all the way back to Noah. Additionally, the Middle Ages had developed a distinct genre of descriptions of cities in which the major monuments were enumerated, the antiquity of the city was vaunted, and the illustrious deeds of the citizens were praised (Hyde 1965–1966).

Leonardo Bruni's *Laudatio florentinae urbis* (*Panegyric to the City of Florence*), composed 1403–4, marks a major development in this literature. Bruni had learned Greek from the Byzantine scholar Manuel Chrysoloras (who himself wrote an important text regarding cities: the *Comparison of the Old and New Rome*, in which the author lauded Constantinople – a city that, after its capture by the Ottomans in 1453, would become ever more a “city of the mind” for the Christian west). His command of Greek allowed Bruni to use a new kind of source, modeling his

panegyric on Aelius Aristides's *Panathenaicus* and thereby introducing considerable novelty to the literature of Italian city descriptions (Witt 1978). Bruni praises Florence for its situation and climate, its cleanliness, abundance of ancient ruins, numerous bridges, and fine buildings. He repeatedly invokes the beauty of the city and argues that all who see it will be immediately convinced of its greatness. Placing the city in its territory according to a concentric hierarchy, Bruni employs the simile of a round buckler, arguing that Florence, in like manner, sits within circles, surrounded by its walls, suburbs, country houses, towns, and castles. Writing in the wake of Florentine victory in the recent war with Milan, Bruni casts the Florentines as the ancestors of the Romans of the Republican period, praising the city's republicanism and arguing that true liberty cannot exist under the rule of a single individual (Bruni 1978).

Despite its highly literary and deeply idealizing (and indeed ideological) character, the *Laudatio* does nonetheless relate to other orders of writing that emerged from the administration of cities themselves. Bruni's insistence on the beauty and cleanliness of the city mirrors the preoccupations of a wealth of urban statutes regulating a wide range of activities – building, commerce, waste disposal, street cleaning, and so forth – of which particularly complete records exist for the Tuscan city-states. Also related to this discourse is another monumental work of Neo-Latin prose dating from the fifteenth century: Leon Battista Alberti's architectural treatise *De re aedificatoria*, which was partially completed by 1452 (Alberti 1988). Drawing on the treatise of the ancient architect Vitruvius, as well as a huge variety of ancient and medieval sources (not to mention his own experiences), Alberti – a humanist of the highest pedigree who also practiced architecture – sets out to establish generative rules for the construction and regulation of the entire built environment. It has been argued that, with this treatise, Alberti initiates the modern discourse of urbanism (Choay 1996). Certainly, questions of the city (how it might be made secure, how it will differ when ruled by a tyrant as opposed to a king, how it ought to be ordered and made beautiful) are

confronted throughout the treatise (Pearson 2011). The cool tone in which Alberti weighs up the strategies of different political regimes anticipates the writings of Machiavelli, while his discussion of the relationship between buildings and civic life establishes a key theme for architectural treatise writers throughout the period. Concepts from political philosophy easily cross into Alberti's discourse on urbanism and continue to flow into the writings of his successors. Thus Francesco di Giorgio Martini's design for a fortified town based on the human form coheres happily not only with Vitruvius's analogies between architecture and the body but also with the notion of the body politic articulated by writers such as Marsilius of Padua (not to mention a broader tradition of political thinking that goes all the way back to antiquity) (Di Giorgio Martini 1967; Marsilius of Padua 1956; Barkan 1975).

Modern commentators have mostly agreed that Alberti does not describe an ideal city in his treatise. Indeed, throughout his substantial literary output, Alberti reveals a marked ambivalence regarding cities and urban life. Aristotle had argued in the *Politics* that anybody who is able to live without the *polis* must be either a beast or a God. Alberti, who drew heavily on Aristotle, often inverts this position, arguing that the city-states make beasts out of men. Other significant distortions of Aristotle occur in the architectural treatise, where Alberti modifies the philosopher's discussion of the relationship between the household and the state to argue that a city should be considered a large house and a house a small city. In fact, a fascination with the interrelated scales of palace and city can be found throughout the Renaissance, for example, in Castiglione's observation that Urbino was a city that seemed to be a large palace and in reactions to the palace of Diocletian at Split, where a huge palace really did enclose a small city (Castiglione 1967; Payne 2014). However, despite the correspondence that Alberti draws between city and house, the relationship between the social units of city and family was far from settled in his thinking; in his treatise on the family, it is raised as a question that the participants in the dialogue are unable fully to resolve. Speaking as a character in

another dialogue, Alberti flatly contradicts Aristotle's assertion that the city exists by nature, asserting instead that it is the product of chance (Pearson 2011).

Although Alberti did not offer an ideal city, many subsequent architectural writers did. Antonio Averlino, known as Filarete, dedicated his treatise (completed c. 1464) to Francesco Sforza, the Duke of Milan, and described within it *Sforzinda*, an ideal city designed for the Duke. In the center of the city, a group of monumental buildings clusters around a rectangular piazza from which radial streets lead outward to walls that describe an eight-pointed star made from two squares (Filarete 1972). Polygonal shapes of this kind would become a staple of the many ideal cities that were designed during the Renaissance, both in Italy and beyond (Kostof 1991). They encapsulate the Renaissance attraction to abstract geometries and the central plan on the one hand and the exigencies of fortification with which architects were often intensively involved, on the other (just witness Francesco di Giorgio's many designs for fortresses and radial cities). A number of towns were constructed in Europe on the basis of such polygonal planning. For example, Palma Nova was founded by the Venetian Republic from 1593 as a fortified town with a hexagonal central piazza from which straight streets lead to a polygon made from nine bastions (later encompassed by successive phases of further polygonal fortification works). Far from constituting an "ideal" town or fortress, however, Palma Nova was beset by intractable problems from the outset (Howard 2011). It is tempting to consider such projects "utopian," and indeed there is some relationship between them and utopian thinking. They are, however, in many senses quite different from Thomas More's *Utopia* (published 1516) which, although it does include the description of a city, exists essentially as a complex critique of European society.

More wrote *Utopia* as a dialogue, set in a city that was among the most important in Europe at the time: Antwerp. By the dawn of the sixteenth century, the urban situation within Europe had changed. A growing population led not to the widespread construction of new towns but to the

expansion of existing large cities. As ever, port cities provided the motors of economic growth. Venice, Genoa, and Bruges had dominated in the fifteenth century; for the best part of the sixteenth, Antwerp was preeminent. Among the many reasons for the precipitous rise of this city, one might cite its connections to a large web of international trade. The city provided a convenient entry to continental markets for English cloth merchants. Additionally, its links with German traders in precious metals were attractive to Portuguese merchants who required silver to exchange for spices in Asia and copper and other metals that could be traded in ports along the West African sea route (Limberger 2001). This activity was part of a nascent European colonialism that provided the most significant occasion for the building of new cities during the Renaissance period. In particular, the Spanish established many new settlements in the Americas, sometimes on existing Aztec and Inca cities (whose sophisticated urban layouts they seem mostly to have disregarded) and other times on land that had not previously been heavily urbanized. In every case the grid, which had also been fundamental for the medieval new towns, provided the basic organizing structure. Across the course of the sixteenth century, this practice of orthogonal planning in the Americas was gradually formalized by the Spanish into detailed instructions for the founding of new towns and cities. European urban planning in the Spanish Americas thus partook of a high degree of uniformity, although improvisation *within* the grid could lead to the creation of very different urban environments (Benevolo 1993; Kostof 1991; Kinsbruner 2005). There were also a number of exceptions. Most striking among these are the initiatives of Vasco de Quiroga, a bishop and judge of the royal audiencia in Mexico who, from 1531, founded two hospital villages from his own funds, in which he intended the local Indian population to live according to principles derived from More's *Utopia* (Benevolo 1993). In so doing, Quiroga brought *Utopia* "back" to the continent in which More had located the fictional island in his book. This extraordinary episode was, however, thoroughly atypical. Quiroga's proposals for a "utopian" structuring of Spanish

America had been rejected outright by the Spanish crown, and he founded his villages in spite of official policy and at his own expense (Zavala 1955).

In most cases, Utopia remained on the page. Tommaso Campanella's *The City of the Sun*, the first version of which was completed in 1602 while the philosopher was in a Neapolitan jail for his part in an anti-Spanish conspiracy, takes clear inspiration from More's *Utopia*. Where Plato's *Laws* was an important text for writers on both politics and architecture, the *Republic* and particularly the description of the philosopher kings, looms large for both More and Campanella. *The City of the Sun* takes aspects of the ideal city tradition and fuses them with utopian thinking in order to create a city of philosophy that contains splendid buildings and impregnable fortifications built, in concentric circles, around an astrological temple (Campanella 1981). Campanella himself was given to prophecy and was influenced by hermetic philosophy and the teachings of Joachim of Fiore. These teachings had, from time to time, affected thinking about a number of cities, including Florence – a city that was inclined to nurture a prophetic sense of its own destiny. In the fifteenth century, as André Chastel first pointed out, both Florence and Rome occasionally appeared in manuscripts to illustrate St Augustine's *City of God*, while Girolamo Savonarola proclaimed Florence to be the New Jerusalem (Chastel 1954; Weinstein 1968). Indeed, the city appears in the place of Jerusalem in the background of Botticelli's *Mystic Crucifixion* (c. 1500). The claim to have established the New Jerusalem was also made, with dramatic consequences, by the Anabaptists at Münster. In the same years that Quiroga was building his hospital villages in Mexico, the Anabaptists began a radical utopian experiment of their own in this German city, one that would end in terrible violence.

Examples of city-making in Renaissance Europe, particularly from the fifteenth century, are relatively rare. When they did occur, they were often on a small scale; one need think only of the Tuscan micro-city of Pienza. From one point of view, this city is little more than a hilltop village with the addition of a trapezoid piazza and

a few monumental buildings. However, it has had an enormous influence on discussions about planning and is still held up as a model by the New Urbanism movement today. The Renaissance did witness sustained and vigorous efforts to theorize and to represent the city, inventing new modes of understanding and new urbanistic frameworks in the process, and this must be considered one of its chief legacies. A steady accumulation of literature devoted to the description and analysis of the city was produced following Bruni's *Laudatio* and Alberti's architectural treatise. The visual representation of the city also continued apace. The subject is too extensive to be explored here; we might merely observe that the genre of the city view gained steadily in popularity from the late fifteenth century (Fall 2012). The publication of the *Civitates orbis terrarum*, a collection of representations of the major cities of the world, printed in Cologne in six volumes between 1572 and 1616, attests to the existence of a substantial market for such images (Swift 2008). By this time, Antwerp was already in decline and Amsterdam was on the rise. The focus of economic activity continued to drift from the Mediterranean to the cities of the North Sea. Meanwhile, in Rome, Sixtus V and his architect Domenico Fontana sought to convert the city into an enormous pilgrim shrine with straight roads that could be easily navigated by coaches. In the process they quite literally paved the way for the new city planning of the Baroque.

Citizenship, Renaissance

Guy Lurie

Abstract

In the fourteenth, fifteenth, and sixteenth centuries, civic conceptions and practices flourished in Western and Central Europe,

beginning in northern Italy but later in other places, including France, Flanders, Spain, England, and Poland-Lithuania. Classical influences and political reality saw the rise of a Republican political sense of citizenship, i.e., a conceptualization of elites as engaged in self-rule of their independent political community, called a *civitas*, a republic, or a commonwealth (which could be a town, a region, a kingdom, or the Church). As such, Republicanism emphasized Classical civic traditions and historical awareness, and it manifested itself in elites' conceptions of politics and in forms of political practice and rhetoric. As part of this process, political identity grew more attached to these political communities. Elites developed ethics of good citizenship, based on the active participation and contribution to the political community of armed citizens and an unequal conception of citizenship that excluded people outside the elites. Jurists legally elaborated citizenship through the formalization of rules on who was or was not part of the political community, how citizenship was gained, and what the grades of civic status were. The sixteenth century saw a transformation of citizenship as the state began its long and gradual process of monopolizing it.

Analytical and Contemporary Conceptions of Citizenship

"Citizenship" has many meanings. Among the conceptions of citizenship regularly used today by scholars in the field of citizenship studies, four conceptions are especially important for an understanding of Renaissance citizenship. First, political citizenship is understood as membership in an independent community entailing participation in its self-rule. Second, legal citizenship is an understanding of citizenship as a legal status conferring rights or privileges, such as protection of the law, welfare rights, political rights, etc. While today these two definitions of citizenship often converge, both historically and analytically, the two senses are distinct: the first sense refers to

being an active political citizen and the second to being a passive national and subject to the law. The third regular sense is citizenship as the identity of individuals through membership in communities or social associations. Today, citizenship as identity is often equated with nationality (i.e., membership in a nation). The fourth sense of the word is more closely related to the ethics of being a citizen. Ethical citizenship is a political virtue or a cultural activity, to which we allude when we exhort someone to "good citizenship" or admonish someone for displaying "bad citizenship" (Kymlicka and Norman 1994; Smith 2002; Joppke 2007; Lurie 2015).

These four concepts of citizenship (political, legal, citizenship as identity, and ethical citizenship) convey our own contemporary analysis of citizenship. While we use these analytical concepts to discuss historical conceptions of citizenship, we should remember that Renaissance conceptions of citizenship varied. For instance, during the Renaissance, regular meaning and usage of the words "citizen" and "citizenship" sometimes simply meant "free city dwellers." Various regions of Europe had various terms to call such people, not only "citizens" but also, for instance, "burghers." Such urban discourse was of course distinct from religious discourse, seen in works of Fathers of the Church such as St. Augustine that elites continued to read and to translate, which discussed "citizens of the heavenly city" (Presles 1486).

Beyond these urban and religious meanings, contemporaries had conceptions of citizenship that were closely related to citizenship in its aforementioned four analytical senses. Political culture, language, and theory resonated with these conceptions, as elites developed and transformed them throughout the period. We shall now turn to these developments.

Heritage and Rupture with the Tradition

Two Classical conceptions of citizenship are especially important for the history of citizenship in the Renaissance. The first conception is the ancient Greek and Roman traditions of political

citizenship practiced in the Greek *polis* and in the Roman Republic and articulated in writings of philosophers such as Plato, Aristotle, and Cicero. The second important ancient tradition is imperial Roman citizenship. Imperial Rome replaced the political form of citizenship in Republican Rome (and ancient Greece) with an imperial form of citizenship, which fits better with the second sense of citizenship, i.e., passive enjoyment of rights (protection of courts and of Roman troops) (Pocock 1998, 2003).

Beyond these somewhat forgotten two Classical forms of citizenship, several important medieval traditions of citizenship flourished long before the Renaissance. Medieval Western Europe saw as many forums for political participation as there were communities. Both urban centers and rural countryside were permeated by communities, each with its own forum for political participation and collective action (Reynolds 1984). The various political forums were based on the idea that the lord should govern through the counsel of his subjects and on Church-based ideas on the legitimacy of power. Ideas on the legitimacy of authority were a major reason for the practice of ruling through negotiation and political participation. Another reason was often a lack of enough power by rulers to enforce their will on reluctant and sometimes distant subjects. Contemporaries based political legitimacy in a large measure on the concepts of “aid” and “counsel,” with strong ideas and practices of contractual relationships among the rulers and the ruled (Bloch 1939; Canning 2011). In the cases of towns, communal ideas of political participation also manifested themselves (the result, in part, of the so-called communal movement, of the High Middle Ages in which towns gained political privileges of self-government through communal institutions).

Against the background of political fragmentation and periods of upheaval, the political and ethical senses of citizenship were underdeveloped before the Renaissance (Heather 1990). Still, ideas about the political body circulated through much of the Middle Ages (Tierney 1982; Black 1992). The eleventh-century rediscovery of Roman law in northern Italy had important consequences for civic ideas. Jurists rearticulated

ideas relating to imperial Roman citizenship as they related to their own social and political reality. Writers on the political authority of rulers relied on precepts of Roman and Canon law to buttress the king’s (or the Pope’s) authority in the kingdom; he was “emperor in his realm.”

Writers in northern Italy and beyond wrote of political virtues in texts used to teach reading and writing and in books of advice to princes. In the thirteenth century, such writers began to incorporate the Roman Republican ideas of Cicero through Macrobius’ *Commentary on Scipio’s Dream* by Cicero and Cicero’s *De officiis*. Brunetto Latini’s *Book of Treasure* (1260s), for instance, elaborated on political virtues and the virtues of the ruler. The translation of Aristotle’s *Ethics* and *Politics* into Latin in the thirteenth century, and later into various vernaculars, was a development that had a profound influence on European political thought, in general, and on civic ideas in particular. Scholastic writers and others began to incorporate Aristotelian ideas into the Christian faith and into their own political reality. Beginning with Albertus Magnus (c. 1200–1280) and Thomas Aquinas (c. 1225–1274) but continuing with many other writings such as Dante’s *Monarchia* (composed between 1309 and 1313) and Marsilius of Padua’s *Defensor pacis* (1324), writers discussed politics as the art of ruling an independent political community (a commonwealth, a polis, or a res publica) in justice for the common good. Writers on the Church (e.g., “conciliarist” writers such as Jean Gerson [1363–1429]) also developed these ideas, for instance, in the context of the Great Schism (beginning in 1378) (Skinner 1978; Black 1992; Viroli 1992).

Jurists in the cities of northern Italy (and beyond) wrote more and more under the influence of Aristotle and Classical Roman Republicanism, especially in the school of jurists called the “Post-Glossators.” Thus, Bartolus of Sassoferrato (1313/1314–1357) applied corporation theory and ideas on imperial sovereignty to the *civitas*, an independent urban commonwealth. Accordingly, citizens were members of such a *civitas* either by birth, naturalization, or privilege. Baldus de Ubaldis (1327–1400) further developed the concept of citizenship, its grades, and how to

acquire it. He also developed the idea that a kingdom may have citizens just as a republic may have subjects. He did so through inserting Aristotelian terms into the legal discourse on citizenship, i.e., recognizing the Aristotelian analysis of “the citizen as both ruler and ruled” (Aristotle 1984). He thus accepted that the citizen of the *civitas* acts also as a subject when he must obey the laws of the city (Canning 1987; Riesenberg 1992; Wells 1995). Similar conceptual moves were followed in other places in Europe in this period. Nicole Oresme of France (in a manuscript written in 1372), for instance, described the *civitas* as potentially a kingdom or a region. He also described the citizens as “subject citizens” who as “citizens” could “participate in ruling, in counseling, and in judging” and as subjects must “obey and suppose and consider that the prince commands well” (Oresme 1970).

The jurists and theorists were embedded in the elitist social and political reality of the towns. As such, the citizens were part of a legal estate or status, free people of means dwelling in towns. Town governments (or other local or realm-wide rulers) defined who in the towns enjoyed full political citizenship and how newcomers could become citizens. The conditions varied somewhat and included heredity, residence, participation in communal expenses, and property qualifications (Riesenberg 1992). These elites often faced pressure for change by rising new social forces within the towns and thus feared civil strife. By defining citizenship legally through heredity and property qualifications, these elites excluded the vast majority of the population: women, artisans, workers, small merchants, and lower classes such as prostitutes and the poor. The excluded majority had various other legal statuses, such as inhabitants and subjects. The work of the jurists, such as Bartolus and Baldus, remained exclusionary and simply gave an Aristotelian theoretical conceptualization of those elite citizens.

Fifteenth-century northern Italy saw a particularly impressive flourishing of civic ideologies, based on Roman sources but connected to the social and political realities and to attempts of the elites to preserve liberty and Republican institutions in the face of the replacement of republics

for single rulers. Today scholars call these civic ideologies “civic humanism.” Writers in that age, especially in northern Italian urban centers (particularly Florence), such as Leonardo Bruni (1369–1444), Coluccio Salutati (1331–1406), Niccolò Machiavelli (1469–1527), and Francesco Guicciardini (1483–1540), to name a few illustrious figures, developed political citizenship and Republicanism in the fifteenth and sixteenth centuries. They developed the idea that ideal politics were based on equal and free citizens who are active and participating members of an independent republic governed by a “mixed constitution” (involving the Aristotelian three good forms of government). Their writings were based on liberty of the republic, anti-monarchical conceptions, individualism, humanism (although humanists in northern Italy did not always take a Republican stance), and Ciceronian-Republican virtues of the citizens. These writers discussed the level of participation citizens needed to display. They exalted not only Republican liberty but also individual civic virtue and an armed and active citizenry (Skinner 1978; Viroli 1992; Pocock 2003).

Republicanism and civic humanism were not confined to northern Italy. In the fourteenth, fifteenth, and sixteenth centuries, Republicanism gained ground throughout much of Europe, including not only Italy but also France, Flanders, Spain, England, and Poland-Lithuania. Social and political realities varied greatly, including devastation of wars and epidemics, social and religious strife, levels of towns’ independence, degrees of bureaucratization, and political integration. Thus, civic practices as well as civic ideologies also varied. Generally speaking, Republicanism emphasized Classical (particularly Roman) civic traditions in rhetoric and stressed historical awareness in chronicles and other writings. Republicanism manifested itself in elites’ conceptualization of politics, in their ideas on the active citizen and his involvement in politics for the common good, as well as in ideas on the Classical virtues. The varied attempts of the Western European monarchies to integrate and coalesce their powers, and reactions of elites to these attempts, influenced civic conceptions. No less influential were regional and urban powers with which they sometimes worked and

sometimes contended. The Reformation too became influential as civic ideas intertwined with it.

Innovative and Original Aspects

The relatively rich sense of political citizenship, seen in conceptions of active participation of free and equal citizens in the self-rule of an independent *civitas* and in Republican rhetoric, retained elitist and exclusionary features as before. That said, popular pressures on the social boundaries of citizenship remained both in political practice and in civic ideas (see, e.g., Nederman 2002). Public opinion too remained important as before (Connell 2016) and sometimes even gained in importance through a growing politicization of the public sphere and a rise in popular participation in politics (Bourquin and Hamon 2010). Civic ideas reflected these pressures through precise definitions of unequal political citizenship, namely, who may participate in exactly what manner. Elitist mechanisms remained almost constant (Magnette 2005). Thus, while popular pressure sometimes rose and while civic humanism rhetorically celebrated the participation in politics of free and equal citizens, the social function of this civic discourse remained not only elitist but also exclusionary: the elite citizens needed to participate in self-rule; the rest needed to obey.

Legal discourse on citizenship also had a dual aspect. While, as detailed, the period saw a formalization of the rules pertaining to citizenship in the political sense, there was also greater formalization of who were citizens only in the legal sense. More elaborate rules were also developed pertaining to issues of naturalization as well as the privileges of citizens versus foreigners in Italy, France, England, Castile, and various other places in Europe. Such more and more detailed rules regarding the status of foreigners, their disabilities, and their ways to attain civic privileges and naturalization, all came to define – through such liminality – what it meant to be a legal citizen, how one acquired such status, who was part of this group, and what were their duties (e.g., taxation) and privileges (Riesenberg 1992; Wells 1995; Kim 2000; Herzog 2003).

At the same time, a growing sense of citizenship as identity potentially also enlarged the *civitas*. This political community in the Aristotelian sense was not the city of old but also the contemporary political bodies such as kingdoms. The Republican discourse had the effect of exhorting activism in defense of these political bodies, for the love of the *patria*. The greater personal commitment to the political body of citizens exhorted by writers sometimes entailed also greater identification with these political entities and even with grander regional or realm-wide entities (such as France or England).

Perhaps nothing shows the innovative nature of Renaissance conception of Republicanism more than the issue of civic agency. While medieval thinkers such as Thomas Aquinas subordinated human institutions to divine institutions, Renaissance thinkers brought back to the forefront worldly concerns and human institutions. Thus Machiavelli's conception of citizenship, for instance, was focused on achieving personal glory in this world (rather than salvation in the next) through success within and through political society. Machiavelli argued that it was essential to channel civic activism toward political achievements of the commonwealth (Machiavelli 1950).

One of the distinctly new aspects of Renaissance civic conceptions was its greater Classical awareness and historical self-reflection. Instead of older notions focused on the universal entities of Church and Empire, contemporaries had a greater sense of history. They conceived of their own times and of contemporary republics, in chronicles and in other forms of expressions, often with historical Classical context (with comparisons, e.g., to Republican Rome) (Skinner 1978; Viroli 1992; Pocock 2003; Nederman 2005).

Impact and Legacy

The sixteenth century gradually saw another transformation of the language and practice of citizenship. Political and social processes contributed to shifting the focus from political citizens to legal subjects. By the seventeenth century, the centrality of the republic was coming to be

eclipsed by the rise of the state. Over the centuries, the state gradually monopolized the granting of citizenship (though the process was by no means linear). Subsequently, nationality and citizenship gradually came to mean almost the same thing, as the nation-state gained a monopoly of providing citizenship (Skinner 1978; Viroli 1992; Sahlin 2004). The legacy of the Renaissance jurists was very important in the rising legal definition of citizenship. The formalization of rules pertaining to civic status began with these Roman and Canon laws jurists, even if later elaborated by modern jurists and finally incorporated into a state (rather than a republic).

Walter Ullmann has argued that the Middle Ages ended when “citizens” in the political world replaced “subjects” in the Christian world (Ullmann 1961). Yet this supposed end of the Middle Ages came only gradually. The legacy of political citizenship in the Classical Republican tradition, which resurfaced in the Renaissance in northern Italy as well as in other regions in Western and Central Europe, remained important but not ubiquitous in light of the aforementioned sixteenth- and seventeenth-centuries’ transformations in political language and the rise of the state. The heirs of this type of political citizenship included the English Commonwealth of the seventeenth century, the French Revolution, and the United States of America in the eighteenth century (Pocock 1998, 2003).

Clavius, Christophorus

Johanna Biank
Max Planck Institute for the History of Science,
Berlin, Germany

Abstract

Christophorus Clavius (25 March 1537/8 – 6 February 1612) was a Jesuit mathematician from Bamberg who defended Ptolemaic astronomy. At the same time, he confirmed Galileo's contradicting observations, such as

the moons of Jupiter and the phases of Venus. However, he was hesitant to interpret them. As an expert mathematician, he contributed to the reform of the Gregorian calendar. His largest success was the promotion of mathematical studies in European and even Chinese Jesuit chairs and colleges. During his life he was famous for his commentary on Euclid's *Elementa*.

Alternate Names

Christoph or Christopher Clavius. The origin of the first name is uncertain. The *Allgemeine Deutsche Biographie* (Bruhns 1876) suggests that “Clavius” is derived from the Latin word *clavis* meaning “Schlüssel” (“key”), whereas the *Catholic Encyclopedia* (Müller 1908) assumes that the original surname was “Christoph Clau.” Other suggestions for Clavius' original name are “Nagel,” which is Latin *clavus*, or “Klau(e).”

Biography

Little is known about Clavius' early life (Lamalle 1957). He was born in Bamberg on 25 March 1537 or 1538. In 1555, at nearly 17 years of age, Clavius entered the Roman Jesuit order (Romano 1996), and the following year began his studies at the University of Coimbra in Portugal under Pedro Nunes, where he excelled in mathematics. While in Coimbra, Clavius witnessed the solar eclipse on 21 August 1560, which probably inspired his later career as astronomer. He is recorded as having been in Rome in 1561 and 1562, where he studied physics, metaphysics, and theology. In 1567, Clavius became a professor of mathematics. In the same year, he observed the total eclipse of the Sun with the telescope. Aside from a brief stint as a professor in Naples between 1595 and 1596, Clavius taught at the Collegio Romano until his death. However, his theological career had a slower start: ordained in 1564, he only became a full member of the Jesuit order in 1575. On 6 February 1612, Clavius died in Rome (The Galileo Project 1995).

Heritage and Rupture with the Tradition

Clavius followed the medieval tradition of Ptolemaic-Aristotelian astronomy (Lattis 1994, 2–7). For that reason he upheld the geocentric cosmos: the theory of solid spheres and of uniform planetary motions, against the increasing attempts to replace Ptolemy and other ancient astronomers with new theories (Jardine 1979). In 1581, Clavius published *Gnomonices libri octo*, an evaluation of rival cosmologies. Here, he addressed the theories of medieval and Renaissance philosophers, such as Agostino Nifo, Bartolomeo Amico, and Clavius's colleague in Rome, Benito Pereira, who believed that Ptolemaeus' astronomy was not compatible with Aristotle's physics. Clavius instead supposed the epicycles and eccentrics were derived from reality, since they explained the celestial phenomena. Moreover, he tried to save Ptolemaic cosmology by combining it with Copernican mathematical devices. However, Clavius failed to draw physical or philosophical conclusions from his observations.

April 1611, he confirmed Galileo's observations to Cardinal Roberto Bellarmino of the Holy Office, but he did not follow Galileo's interpretations (Snow 2005, 3). These findings are mentioned in Clavius' last version of the *Sphaera* (1611–1612) and included the following: the lighting on the surface of Venus (named “phases of Venus”), the moons of Saturn (known today as Saturn's ring), and the moons of Jupiter. Referring to Galileo's *Sidereus Nuncius* (1610), Clavius doubted that the lunar surface was uneven or mountainous, because he maintained the Aristotelian concept of the perfect spherical shape of the celestial bodies. Moreover, the phases of Venus observed by Galileo contradicted Ptolemy's planetary order (The Galileo Project 1995).

Clavius had been acquainted with Galileo since his visit to Rome in 1587, and from then on exchanged letters and books with him (Clavius 1992a, vol II, 1, no. 42–45, vol V, 1, no. 240, vol VI 1, no. 318, 319, 327). He had a large influence on Galileo's thinking and methods. There have even been suggestions that Cardinal Bellarmino was influenced by Clavius in testifying to

Galileo's abnegation when Galileo was first tried by the Inquisition in 1616.

Innovative and Original Aspects

Clavius was not so much an innovative mathematician (Knobloch 1995a, 41–54), but a promoter of mathematical studies (Smolarski 2002). He revised the mathematics curriculum at the Collegio Romano, where he taught for almost 50 years. The textbooks he wrote at the Collegio Romano were read by Jesuit chairs throughout Europe and also China. For example his early commentaries on Sacrobosco's *Sphaera* (1570) (Clavius 1999a), in which Clavius gives a precise account of mathematical problems (Pantin 2013, 93) and on Euclid's *Elements* (1574) Clavius 1999b were published in multiple editions during his lifetime (Sommervogel 1891; Knobloch 1990a; Knobloch 1995b; Snow 2005, 3f.).

In his work on the *Astrolabium* (1593), Clavius was the first to use the decimal point in goniometric tables (O'Connor and Robertson 2008), a system to study the phenomena in luminous reflection. With his *Algebra* (1608), Clavius attempted to elevate the status of this discipline, referring to the late ancient mathematician Diophantus (Sasaki 2003, 74–76). At the end of his life, Clavius collected his works in five volumes entitled *Opera mathematica*, published between 1611 and 1612 in Mainz (Bruhns 1876; Delambre 1827; <https://clavius.library.nd.edu/>). Moreover, he also intended to write a *Theorica planetarum*, which he never completed and of Clavius solar theory only.

Clavius was one of the first to make telescopic observations verifying Galileo's phenomena. He observed eclipses of the Sun in Coimbra on 21 August 1560 and in Rome on 9 April 1567, and he experienced the *novas* of 1572, 1600, and 1604. Moreover, Clavius was a constructor of astronomical instruments; in particular, he constructed an instrument used to determine fractions of angles, sundials, and quadrants. He also improved and described the Nonius, a system of concentric circles used to improve the measuring of angles. This instrument made a scale more

sensitive so that subdivisions of a distance could be determined.

Furthermore, Clavius introduced the globe composed of land and water into Scholastic theory (*terra firma*), combining Aristotelian physics with the evidence of the Earth being above sea-level (Baldini and Casanovas 1996; Echeverría and Amunátegui 2013). In particular, he analyzed the physical relation between the four elements in detail to develop a structure of the sublunary world.

Another great achievement lies in the calendar reform (1577–1582) (Lattis 1994, 20f.). Clavius took part as the oldest member of the commission selected by Pope Gregory XIII, which also included names of other noteworthy individuals. As a consequence of the inaccuracies in the Julian calendar, Christian holidays were changing over the years in relation with the seasons. The problem was that there were three more leap years within 385 years. For this reason, the spring equinox, which is the date from which Easter and the subsequent holidays had been calculated, was not compatible with the calendar. In 1579, Clavius computed the basis for a modern “Gregorian” calendar, modifying a proposal by Luigi Lilio. Clavius’ solution was that 4 October 1582 should be followed by 15 October so that 11 days of the calendar could be skipped. Moreover, he introduced the idea that all years divisible by four are leap years, as well as years ending with 00, if they are divisible by 400. For this he used Erasmus Reinhold’s *Prussian Tables* along with Luigi Lilio’s book. His calendar reform was prescribed in 1582 in the bulla *Inter gravissimas* by Pope Gregory XIII.

Impact and Legacy

Clavius’ fame remained untouched in the seventeenth century, because his writings were not dangerous to the Catholic Church. Clavius owes his epithet, “Euclid of the sixteenth century,” to his commentaries and editions of Euclid and Sacrobosco (Rommevaux 2005; Claessens 2009). His works became the standard university textbooks for mathematicians and astronomers for almost 200 years. They were, for example

mentioned by René Descartes, Tycho Brahe (Lerner 1995, 145), Johannes Kepler, Galileo Galilei, and Gottfried Wilhelm Leibniz and René Descartes, (O’Connor and Robertson 2008) in their works. Also the critics of Copernicus and Galileo learned mathematics partly from Clavius’ textbooks. These commentaries were even introduced in China, for example by Clavius’ student Matteo Ricci, who translated Clavius’ *Euclid*, *Geometria Practica*, and *Trigonometrica* into Chinese (Lattis 1994, 5; Sigismondi 2013).

The missing 11 days in Clavius’ new calendar were opposed by scholars such as François Viète, Joseph Scaligar, Michael Maestlin, and the Protestants for confessional and political reasons. However, despite these criticisms, the Gregorian calendar was quickly introduced in Spain, Portugal, and most of Italy, as well as the other Catholic countries 1 or 2 years later. In Germany, the Gregorian calendar was adopted in 1700, in Great Britain in 1752, in Russia in 1918, and in Turkey in 1927. Today it is used worldwide and it is fragments survived (Clavius 1992b) assumed that it will function correctly for over 3,000 years until an error occurs.

Bernardino Baldi (Baldi 1998), a younger contemporary of Clavius, wrote Clavius’ biography. He probably knew Clavius personally; at least in one letter he requested information on his life (Clavius 1992a, vol II, 1, 128–130, no. 52). Furthermore, Johannes Kepler mentioned Clavius’ *Sphaera* in the dedicatory letter to his *Epitome of Copernican Astronomy* (written 1617–1621) (Kepler 1866, 117). The English clergyman and natural philosopher John Wilkins cited the words that Clavius spoke on his deathbed in his *Discourse Concerning a New Planet* (1640). Here, Clavius expressed the need for a new theory besides Ptolemy’s to explain the phenomena observed by Galileo. In this treatise, Wilkins tries to prove that the Moon is inhabited.

There are also two personal judgments by contemporaries. First was Franciscan Pope Sixtus V, and judged Clavius with these words: “If the Jesuit order had not achieved more than Clavius, it should have been praised for his sake alone.” Second was Joseph Justus Scaliger, a Dutch religious leader and scholar, who had suggested an

alternative calendar reform, and mentioned that “a critique by Clavius was for him more worthy than an appraisal by any other man.”

Claymond, John

Born: c. 1468, Frampton, Lincolnshire

Died: December 1536, Oxford

Grantley McDonald

Faculty of Music, University of Oxford,
Oxford, UK

Institut für Musikwissenschaft, Universität Wien,
Vienna, Austria

Abstract

John Claymond was a prominent representative of early Tudor humanism and the first president of Corpus Christi College, Oxford. His most

extensive scholarly work is a 20-volume commentary on the *Natural History* of Pliny the Elder (Corpus Christi College, Oxford, MSS 178–181; Basel, Universitätsbibliothek, MS K I 4). His commentaries on Plautus and Aulus Gellius are lost.

Biography

Claymond was admitted to Magdalen College, Oxford, in 1484, and appointed fellow in 1488. In 1499 he was ordained as priest and perhaps met Erasmus, who later spoke admiringly of Claymond's moral probity, and dedicated to him an edition of Chrysostom's *On fate and divine providence* (1526). In 1507 Claymond was appointed as president of Magdalen and lectured on Peter Lombard's *Sentences*. In 1517, Bishop Richard Fox appointed Claymond as first president of Corpus Christi College, a trilingual institution intended to promote humanistic education, like similar institutions at Alcalá (1508), Leuven (1518), and Paris (1530). Claymond held several benefices and used their income to support students at Magdalen, Brasenose, and Corpus Christi Colleges. Besides his own extensive (and extensively annotated) library, Claymond built up the college library at Corpus Christi College, for example, with books from the estate of the English Hellenist William Grocyn. Corpus Christi College would train many prominent figures in sixteenth-century England. Its strength in medical learning was probably a result of the influence of Thomas Linacre on Claymond and other early members of the college, such as John Clement and Edward Wotton.

The earliest curriculum of Corpus Christi is somewhat unclear. Fox prescribed seventeen authors whose works were to be expounded by the lecturer in humanities, an office that Claymond apparently held until the end of his life. Among these was Pliny, whose encyclopedic but uncritical writings on political and natural history – astronomy, geography, zoology, botany, and mineralogy – were known throughout the Middle Ages. Despite the strong reception of Pliny in the Middle Ages, the received text in print, based principally on

continental manuscripts, was partially corrupt. Although the accuracy of some of Pliny's statements was questioned in the fifteenth century – in 1492, Niccolò Leonicensio published a refutation of Pliny's errors in medicine – many scholars remained hopeful that improving the text of Pliny or gaining further insight into his technical vocabulary would resolve these apparent difficulties.

Several important early manuscripts of Pliny were preserved in England, and some medieval British writers – Aldhelm, Bede, John of Salisbury, and Roger Bacon – had commented upon his work. Claymond used manuscripts at Oxford to improve the received text by using the philological methods developed by Poliziano and Beroaldo. He mined the works of ancient authorities – Galen, Hippocrates, Dioscorides, Celsus, Paul of Aegineta, Ptolemy, Strabo, Pomponius Mela, Columella, Varro, Cato, Aelianus, Solinus, Aristotle, and Theophrastus – and modern writers – Barbaro, L'Aigue, Rhenanus, Budé, and Tunstall – to verify Pliny's assertions. (It was not until later in the sixteenth century that readers of Pliny tested his assertions more persistently against natural observations.) However, he sometimes heaped up authorities uncritically and occasionally repeated their errors of citation. Claymond was perhaps prompted to pursue philology rather than engage with the controversies of the *vita activa* after witnessing the fall of the political humanist Thomas More.

Two plans to publish Claymond's Pliny commentary foundered. The first was initiated by the Basel humanist Simon Grynaeus and the printer Johannes Bebel, who gathered manuscript materials in England in 1531 and 1532. Sixteen volumes of Claymond's commentary are preserved in Basel, presumably brought in preparation for this edition, which never appeared. In the 1560s, the Basel printer Johannes Oporinus tried to revive the project, soliciting further materials from the English medical humanist John Caius, but this plan also failed, probably because the work was simply too long. Among the few contemporaries who cited Claymond's commentary was Edward Wotton, who drew upon it for his commentary on Aristotle's *On the parts of animals* (1552). Despite its limited reception,

Claymond's commentary on Pliny represents a peak of early Tudor humanist erudition.

Clocks, Renaissance

Lily Filson
Dipartimento di Filosofia delle Scienze
Formative, Ca' Foscari University of Venice,
Venice, Italy

Abstract

The reintroduction of time-keeping technology to the Latin West from the thirteenth century and its subsequent submission to new applications produced the appearance of both large and small-scale clocks in the Renaissance. The great bulk of these works often replicated principles preserved from Classical antiquity and Medieval Arabian sources, but major technological advances appeared intermittently in the Renaissance which propelled clock-making technology forward. Just as we would no sooner exchange the precision of an atomic clock today for a sand-glass, so too in the Renaissance did old ways of clock-making rapidly become obsolete with the invention of new systems: weights, spring-drivers, wheels, gears, and organ-barrels. A similar phenomenon comparable to modern trends also has been observed with the Renaissance explosion of

technology; as it became more advanced, it became smaller and more compact. What had been housed in the monumental proportions of Medieval Cathedral clock-towers had by the late Renaissance been reduced at its most extreme to the size of a ring to be worn on an emperor's finger. The Renaissance aim of mastering the natural world around, space as well as time, can be inferred in the increasingly masterful method devised to standardize and measure the passage of not only the sun but the moon, the planets, the zodiac, and other visible astronomical phenomena as well.

Synonyms

Automation; Clockwork mechanics; Time-keeping technology

Innovative and Original Aspects

The time-keeping device, whatever its operating principle – sun, water, weights, springs, or gears – had stood in the culture of Classical antiquity inherited by the Renaissance humanists as the quintessential symbol of the ordered cosmos. In scholarship of the early-modern period, the clock became a seminal image for how many Enlightenment-era philosophers began to reimagine the cosmos and man's place within. In the period directly preceding this flourishing of thought, the thirteenth through the mid-seventeenth centuries, the development of time-keeping technology mirrored what was on a macroscale humanity's ever-increasing command and quantification of the surrounding natural world. Technologically and artistically, the Renaissance continued to develop and refine a phenomenon most properly traced to the Medieval Period, as returning Crusaders and invigorated trade routes are credited with the reintroduction of time-keeping technology to Western Europe. The line of direct descent from Classical (predominantly derived from the work of Ctesibius and Hero of Alexandria) sources of clocks in Western Europe is believed to have

been severed sometime after the documentation of a sixth-century clepsydra by Cassiodorus. That technology would not reappear until it had been filtered through the cultural influence of the Medieval Muslim East, through the preservation of Classical technology and subsequent original elaborations and novel applications, such as the dimension of human comfort, previously absent from known Greco-Roman mechanical devices, but prominent in the ideation of the robotic serving-girl in the *Book of Knowledge of Ingenious Devices* by Al-Jazari. Many mechanical arrangements observable in Arabic-engineering works have had to varying extents their corollaries located in existing medieval mechanical treatises. The water-clock, with its origins developed into the "turret clocks," which substituted solid weights in lieu of water-weight. The most monumental assimilation of this reinvigorated mechanical and technological knowledge was put on display in the clock-towers of the great medieval Cathedrals (Strasbourg and Venice are early, large-scale examples of astrological clocks) built from the thirteenth century to the seventeenth, and in some cases beyond. As clocks became household objects and correspondingly diminished in size to a comfortable portability, they increased proportionally in prestige and esteem as objects of luxury and social status in Renaissance courtly and educated circles. The development of spring-technology in the 1400s facilitated the ever-increasing intricacy of minute clockwork, primarily in the German craft centers of Augsburg, Nuremberg, Dresden, and Ulm. Works created by the Habrecht brothers in the 1550s have been recognized as the earliest documented departures from strictly Heronic components: wheel-work replaced levers, gears replaced strings, and organ-barrel programming replaced hydraulically delayed sequences. Clockwork technology began to infringe upon the monopoly of previously hydraulic-powered organs in princely gardens and some churches of the same time period. In the majority of cases, time-keeping technology was further ornamented with and embellished by mechanically driven moving automata, from the large cathedral-jacquemarts (bell-ringers) and assortment of angels, shepherds, and other major

characters from predominantly (but not always) Biblical sources in religious and secular theatrical tableaux to the smaller automated minutiae of the opulently crafted mechanical *nefs* which propelled themselves around the tables of Rudolph II and other European rulers in the sixteenth and seventeenth centuries. In the case of the former, the prevailing inclination to veil the mechanical operations of mechanical devils, angels, animals, and humans in church dramas and elsewhere was intermittently lifted by engineers such as Giovanni Fontana, who wrote openly of the purely mechanical processes causing statues to spit fire or move their eyes and wings. A fifteenth/sixteenth-century automaton of a chained devil in the Collezione Permanente of MUDEC Milano provides perhaps the only surviving example in size, function, and style of the automata whose workings Fontana's manuscript drawings reveal. The sixteenth-century automata of Juanelo Turriano, a lute-player in the Kunsthistorisches of Vienna and an automated monk currently in the Smithsonian's collection, are miniaturized iterations of the larger theatre-automata powered by spring-driven clockwork and belong with the *nefs* in the latter class of objects created for the personal delight of a single patron (in the Turriano automata's case Emperor Charles V) rather than an audience to a spectacle with religious or entertainment aims. Fantastic tales of mechanical inventions which made use of the rapidly developing engineering facilities of the Renaissance range from those generally acknowledged to be apocryphal (the android of Albert the Great or the iron fly of Regiomontanus and Bishop Virgilius of Naples) do not necessarily fall too far from descriptions of documented automata created by Leonardo da Vinci and Hans Bullman.

Collège de France

Luigi-Alberto Sanchi
CNRS, Institut d'histoire du droit, Paris, France

Abstract

A long-lasting Renaissance creation, the Collège de France was precariously founded under King Francis I thanks to Parisian humanists who asked the monarchy to protect free studies on ancient and oriental tongues against the powerful, traditional Sorbonne University. The professorship of Petrus Ramus, from 1551 to his assassination in 1572, set the

acme of sixteenth century's Institution des Lecteurs Royaux. Its building was not officially decided before King Henri IV and was opened after 1610, under Louis XIII. Less brilliant during the seventeenth century, and then called Collège royal, it still allowed new disciplines, ranging from languages and history to maths through medicine, to be taught in stable conditions and at international standards by French or foreigner scholars.

The Background: A Long Struggle for Humanism in Paris

Thanks to the spread of Italian Humanism, early sixteenth-century Western Europe was in conditions to start permanent university teaching in ancient and oriental tongues. This was no longer meant for practical purposes, such as obtaining religious conversions by Orientals, but for building and spreading a scientific knowledge in itself. More than in Italy, ancient Greek and Hebrew interested many European scholars aiming to better understand biblical texts, a cultural movement known as “Christian Humanism.” Towns with important theological universities, like Oxford and Cambridge, launched chairs in Greek and Hebrew; Louvain opened in 1517 its “Collegium Trilingue” (dedicated to the “Three Tongues”: Greek, Hebrew, and classical Latin); Rome itself had a college for Greek studies, founded by Janus Lascaris in 1515; new universities were founded, like Vienna's Collegium Poetarum et Mathematicorum in 1501 or Alcalá de Henares, Spain, in 1508.

Medieval Paris was par excellence the theological capital with its Faculté de Théologie, also called La Sorbonne, and was bound to keep traditional university practice without changes. That is probably the main reason why the Parisian equivalent for Louvain's Collegium Trilingue took until 1530 to be established – and that in a precarious

way. Attempts to charge Erasmus, in 1517, and Lascaris, in 1518, of founding this kind of new “college” in Paris were not successful (Lefranc 1893, 1932; Gadoffre 1997; Tuilier et al. 2006; de La Garanderie 2010).

Led by Jacques Lefèvre d’Étaples and, later, by Guillaume Budé (de La Garanderie 1995; Fumaroli 1998; Maillard et al. 1999, 2010), the Parisian humanist movement struggled during King Louis XII’s reign to be recognized but obtained the Court’s favors only after 1515, with King Francis I, who will be afterward remembered of as the “Father of Arts and Letters.” Budé introduced his philological masterpiece *Commentarii linguae Graecae*, printed in September 1529 (Budé 1529), with a Greek Preface to the King which is considered to be the starting point of Collège royal, because he vibrantly asked the King, to whom the preface was read in a French version (Paris, B.n.F., ms. fr. 25445), to fulfill an old promise to finance the construction of a majestic building for the teaching of the “two languages” (Greek and Hebrew) and to appoint French and international scholars in order to educate the French (Sanchi 2006). Shortly after, beginning of 1530, the first scholars were given the professorship, but no building was started; this will officially be decided only by King Henri IV and opened after 1610, under Louis XIII (Chamard and Girot 2001).

Humanists in Paris took full advantage of such important protectors and sponsors as the King’s sister Marguerite de Navarre, Paris’ bishop Étienne Poncher, the King’s confessor Guillaume Petit, and a few others, like Jean Du Bellay, the future cardinal, who represented an enlightened wing of the French catholic Church as decisive as the Parisian humanist movement for the survival of Collège de France during its first years (Bulæus [Du Boulay] 1673; Lefranc 1932; Tuilier et al. 2006). Such protections were really necessary. Defined as the chief of the intellectual “Conservative Party” (Farge 1992), Noël Bêda, the dean of the theological Faculty from 1520 to 1533, actively menaced any scholar in Paris who tried to teach biblical Greek or Hebrew or criticize Jerome’s Vulgate, without a Ph.D. degree in Theology. The trial that Bêda called in 1533 against

the first “lecteurs royaux” is a famous moment in Collège de France’s history and a fundamental, if silent, humanist victory on the theological faculty (Lefranc 1893, 1932; Tuilier et al. 2006). That guaranteed the Institution even from the prosecutions which took place the next year, after the “Affaire de Placards” scandal (October 1534), a radical anti-Catholic bill-sticking which provoked emotion in Paris and potentially endangered every humanist or printer in France, systematically suspected of being a Lutheran.

Textual Approach, Scientific Horizons

Founded on a thorough study of ancient tongues, pushed at the best time’s standards, the teaching of the first “lecteurs royaux” extended quickly to all the sciences, since the proficiency in Ancient Greek opened the way to enlarge knowledge in many scientific areas, ranging from medicine to mathematics. That is why the first chairs in 1530, allowed to the French Pierre Danès and Jacques Toussain in Greek and to the Italians Agathias Guidacerius and Paulus Paradisus (Paolo Canossa) in Hebrew, came together with one in mathematics, offered to the French Oronce Fine (Parenty 2009; Kessler-Mesguich 2013). Because of the opposition of the university, the Institution had to wait until 1534 to get a chair in Latin Eloquence (Bulæus 1673), appointed to Barthélémy Latomus, from Luxembourg. In 1538, Guillaume Postel was appointed with a new chair dedicated to the “Oriental Tongues” (Arab and others) which also helped developing the study of sciences; in 1540 a second chair in mathematics was created, and, in 1542, the new medicine teaching was opened by the Italian surgeon and anatomist Guido Guidi (Vidus Vidius). The lectures were announced by billposting in the Latin Quarter and open to the public, as it is attested by a register of the Paris Parliament, where the contents of some bills are quoted (Paris, Archives Nationales, X1A 4895).

An important step forward to strengthen the legal existence of the Institution was done in 1546 with a “Committimus,” a King’s letter setting the Royal Professors out of the reach of ordinary justice – a privilege giving them a

prestigious status. After that, the second half of sixteenth and early seventeenth century made the glory of the Collège with key scholars as Adrien Turnèbe, Denis Lambin, and Isaac Casaubon in Greek and Léger Du Chesne and Frédéric Morel in Latin; new chairs in surgery, Arab, anatomy, and botany were founded (see a list of professors in Lefranc 1932). Jean Dorat, professor in Greek, educated the poets of the Pléiade group, like François Ronsard and Jean Du Bellay.

It was ordered in 1566 that any new candidate for professorship be elected after a public examination by the other Royal Professors and, in 1594, that they take the loyalty oath to the King, after the Civil War.

The most successful as well as revolutionary teaching was Petrus Ramus' teaching in Greek and Latin philosophy, which was characterized by a bold anti-Aristotelian point of view, from 1551 to his assassination in 1572 (Couzinet et al. 2004). In his 1568 testament, Ramus also left an amount of money to fund a chair in sciences, called "Ramus chair," which lasted until the French Revolution (Lefranc 1893; Chamard and Girot 2001).

A Still Living Heritage

The Institution of the Royal Professors was the central organization for what has been called a "Cultural Revolution" in France (Gadoffre 1997): it operated the long-term shift in the selection of French *élite* from mainly military or merely legal to scientific and erudite. The educational strategies of families who wanted to have power and government responsibilities in France mirror this major change. The renewal of French and European universities as well as general culture received an important contribution from the first Parisian humanists. These scholars took the legacy of Italian Renaissance, then, in a more mature phase, by sixteenth-century Royal Professors and finally by the Collège Royal as it was established in the seventeenth century. These professorships were narrowly associated to the activity of the most celebrated French printers – and, among them, the Royal printers, such as Robert Estienne (Stephanus) or Morel, aiming to give Europe a

new generation of Classical editions in all fields, after the first, mostly Italian, generations of humanist printers.

Collège Royal's impact needs to be measured more precisely by adding each professor's teaching and legacy during his period of activity at the Collège, especially for the most famous of them. It can also be said that fields of Classical and Oriental philology, medicine, and physical sciences took a great advantage from the existence of the Collège, given the King's protection it had in an era of heavy control on public teaching in Catholic Counter-Reformation countries, when several intellectuals and scholars were pushed to leave France and its censorship. The privileged status that was granted to Collège Royal ensured its survival also through the French Revolution and until today. A characteristic point of its legacy is the call for scientific innovation and excellence and for the creation and fostering of new disciplines, which became a major feature from the nineteenth century on.

Colombo, Realdo

Born: Probably between ca. 1510 and 1515

Died: 1559, Rome

Frances M. Gage
Buffalo State – The State University of New York,
Buffalo, NY, USA

Abstract

Realdo Colombo was a pupil, colleague and later rival of Andreas Vesalius. He studied and subsequently taught at the University of Padua. A major anatomist of Vesalius' generation,

Colombo's only published work was *De re anatomica* (1559). He was a friend and physician of Michelangelo Buonarroti, with whom he intended to collaborate on an anatomical treatise.

Biography

Documentation concerning Colombo's life and work is minimal. After a youthful stint in his father's pharmacy, Colombo transferred to Venice, apprenticing between ca. 1531 and 1538 under the anatomist Giovanni Antonio Lonigo, who performed dissections at the *Studio* in Padua, though he was not a member of the faculty. In 1538, a year after Andraes Vesalius had assumed the chair in surgery and anatomy at Padua, Colombo matriculated there. Colombo was evidently no ordinary student; already a year before he received his degree (1541), he was appointed to the chair of logic. In 1542, while Vesalius temporarily vacated his chair to oversee the publication of *De humani corporis fabrica*, Colombo assumed Vesalius's post. At this point the two men's relationship was amicable, but it was shortly thereafter to turn sour, and Vesalius and Colombo became bitter rivals. Nevertheless, Colombo took over Vesalius' chair when he vacated it permanently in 1544. Colombo remained in Padua only briefly, however, transferring to the *Studio* in Pisa by 1546. His stay in Pisa was likewise short. By 1549, Colombo had moved to Rome permanently, where he would pass the remainder of his life, holding positions at the *Collegio Medico* and the *Studium Urbis* (Moes and O'Malley 1960; Colombero 1982; Colombo 2014).

In an important letter of 1548, Colombo addressed his patron Cosimo I de' Medici, requesting leave to reside in Rome in order to undertake research for an anatomical treatise. For this work he declared his intention to collaborate with Michelangelo Buonarroti (1475–1565). The nature of their collaboration remains subject to considerable speculation. Colombo's sole treatise is *De re anatomica*, published posthumously by his sons in 1559, though it may have been completed earlier. The degree to which Michelangelo may have contributed to this treatise, if at all,

is debated (Parronchi 1968; Cunningham 1997; Stringer and Becker 2010).

Colombo frequently remarked in *De re anatomica* on Vesalius' errors, but his primary points of departure remained Galen, the Alexandrian anatomists Herophilus and Erasistratus and Vesalius (Cunningham 1997). In contradistinction to Vesalius, however, who leant emphasis to dissection, Colombo was the leading advocate of vivisection, the subject of the fourteenth book of *De re anatomica* (Cunningham 1997; French 1999). Colombo promoted vivisection for the purpose of studying the function and movement of the body. He underscored the role of experience in anatomy and sought clarity in his textual presentation (Cunningham 1997; Shotwell 2013; Colombo 2014).

Colombo claimed two major anatomical discoveries, that of the pulmonary circulation (making him an important predecessor of William Harvey), and that of the clitoris. In neither case could Colombo claim absolute primacy, though his knowledge of the work of Michael Servetus (1509/11–1553) and the Arab anatomist Ibn al-Nafis (1213–1288) in the case of the pulmonary circulation is unlikely. Although several writers had previously remarked on the existence of the clitoris, Colombo certainly considered its function in detail, emphasizing the importance of female pleasure in generation (Colombero 1982; Stringer and Becker 2010).

Colonna, Vittoria

Born: 1490 or 1492, Marino (Rome)

Died: 25 February 1547, Rome

Eleonora Carinci

Università Ca' Foscari, Venezia,
Venice, Italy

Abstract

The noblewoman and poet Vittoria Colonna, Marchioness of Pescara, was an exceptionally influential and complex figure of Renaissance Italy. She experienced a crucial and delicate period for Italian history, and she participated actively in contemporary cultural, political, and religious debates. She had epistolary exchanges and long friendships with the most relevant figures of her time, and throughout her sophisticated and successful poetry, and her acute and effective letters she contributed in different and original ways to the development of Early-Modern Italian culture and tradition. Moreover, she was the first woman of the Italian Renaissance to publish her collections of poems under her name, opening the way to other women writers.

Biography

Daughter of the military leader Fabrizio Colonna and Agnese da Montefeltro, Vittoria received a

fine humanistic education. Since her youth, she used to be involved in aristocratic circles and had a role in the administration of her family's territories. In 1509, she married Ferdinando (Ferrante) Francesco d'Avalos, Marquis of Pescara, to whom she had been betrothed when she was a young child. During the years of the marriage, while Ferrante was in war, Vittoria moved to the Aragonese Castle in Ischia, at the court of her husband's aunt Costanza d'Avalos, where she entertained cultural relations with the Neapolitan cultural circles and literati. In December 1525, Ferrante died in war, and this grief signed profoundly Colonna's life. The widow, who was dissuaded to become nun by Pope Clemente VII and refused to marry again, chose an austere, pious, and mostly secluded lifestyle. This, however, never stopped her from travelling in different parts of Italy, from writing sophisticated poetry, and from maintaining intense epistolary exchanges with contemporary intellectuals, literati, and relevant political figures. She was undoubtedly a thoughtful observer of the complex political, cultural, and religious life of her time, and she was part of the intellectual elite who contributed actively to its development. Indeed, during her lifetime, which coincided with the apex of Italian Renaissance literary, artistic and philosophical flourishing, important events such as the wars in the Italian peninsula and the protestant reform changed radically Italian and European politics and culture. In early 1530s, in Rome, Colonna was involved in the – successful – defence of Capuchin friars against the Pope's decision to submit them to the Observants. The Capuchin movement, based on humility and charity, was particularly important for Colonna. The friars represented a model of new spirituality and renovation of the Church, which would have been crucial aspects for the development of her spirituality in the following years. In the same period the Marchioness met Bernardino Ochino and Michelangelo Buonarroti, who would have become important friends and reference points for her, and she began a long and fruitful epistolary exchange with Pietro Bembo. Between 1537 and 1538, Colonna spent 9 months in Ferrara, where she had contacts with Renée of France and Marguerite de Navarre, both involved

in Reformed movement. In 1538, she travelled to Prato, Bologna, Pisa, and Lucca to attend Ochino's sermons, and in the same year the unauthorized *princeps* edition of her *Rime* came out in Parma.

In 1541, the Marchioness moved to the Convent of Saint Catherine in Viterbo. In those years, the group of *Spirituali*, known as *Ecclesia Viterbiensis*, close to Valdesian Evangelism, were meeting in Viterbo. Figures such as Reginald Pole, Marcantonio Flaminio, and Pietro Carnesecchi were active in the movement and met to discuss religious issues and to find a peaceful compromise between Reformers and Catholic Church in order to avoid the scission. Colonna participated in the meetings and discussions of the group and established a close friendship with Cardinal Pole, who became a crucial figure for the development of her spiritual thought. Between 1539 and 1542, she wrote her religious proses – the *Pianto sopra la Passione di Christo* (*Plaint on the Passion of Christ*), which was originally a letter addressed to Ochino, and the *Orazione sopra l'Ave Maria* (*Oration on the Hail Mary*), both printed posthumously for the first time in 1556. In 1544, Colonna moved back to Rome, guest of the Benedictine convent of St. Anne, and died in 1547 in the Palazzo Cesarini.

Heritage and Rupture with the Tradition

With her *Rime* Vittoria Colonna reinvented the lyrical tradition from a female perspective, throughout her very own poetical pursuit and sensitivity. She used Petrarchan model in a moment in which Sixteenth-century Petrarchism was still being codified, and she contributed to its development. Therefore, it would be misleading and reductive to define her as just a Petrarchist poet. Her poetry includes Petrarchan, Dantean, Platonic, and Biblical references, all interpreted from a personal and original perspective. The result is a very original and sophisticated poetry, which reinterpreted and elaborated the models, seeking its own words and images (Sapegno 2016b).

Her theological thought, which emerges in her poems, in her letters and in her religious prose writings, is certainly based on the deep knowledge of Christian tradition but also reflects the delicate and complex historical and religious moment she experienced, her network of friends as well as her extra-ordinary personality. She never adhered to the Reform, as some of her friends, such as Ochino, did, but she had probably read the same books that reformers read, while accepted and elaborated some philo-reformed concepts like the doctrine of justification for *sola fide* (Brundin 2008).

Innovative and Original Aspects

Colonna was the first woman author of an entire collection of poems printed under a female name in the Sixteenth century. From a female and widowed point of view, she modified radically the tradition of love lyric poetry, based on the paradigm of a male lover and a female beloved. She gave a female and authoritative voice to the lyrical “I,” and reflected on poetry and its definition from a female point of view. By using, re-interpreting and modifying the lyrical tradition, she realized a new and original form of poetry/meditation/prayer, in which a profound attention both to meaning and form emerges, as well as a continuous pursuit of knowledge (Sapegno 2016a, b).

The central theme of Colonna’s poetry is indeed the poetic writing itself, developed through the analysis of the relationship between suffering and writing, and the capacity of reason to dominate the senses. These topics, associated with the construction of an inner view and thought, crucial for writing poetry, are on the basis of all Colonna’s poetic production and its evolution, transformation, and sublimation. They are recognizable in both the so-called *rime amorose*, addressed to the dead husband, and the more mature *rime spirituali* (Sapegno 2016b).

Colonna’s religious prose and spiritual letters, focused in particular on the figures of Christ and the Virgin Mary, reveal a profound understanding of the Christian tradition. However, at the same time, they reflect a very personal,

original, empathic, and introspective interpretation of the figure of the Virgin Mary and her role in salvation, a topic which emerges also in some of her *Rime* (Brundin 2008; Carinci 2016). In the letters to Costanza D’Avalos Piccolomini on contemplative life of St Catherine of Alexandria and on the active life of Mary Magdalene, Colonna also considers the role of women in learning and teaching (Brundin 2008).

Her vast correspondence depicts an exceptionally powerful woman, well aware of and actively involved in the political and religious issues of her time. She had a political impact in several questions, such as the abovementioned defense of the order of Capuchins, while relevant figures, including the Emperor himself, asked for her advice.

Impact and Legacy

In spite of a withdrawing character, Vittoria Colonna was an influential and well-known woman, greatly estimated by her contemporaries. As her epistolary exchanges demonstrate, literary and relevant figures of her time, such as Pietro Bembo, Baldassar Castiglione, Paolo Giovio, Gasparo Contarini, Michelangelo Buonarroti, Bernardino Ochino, Reginald Pole, Marguerite de Navarre as well as Popes Clemente VII and Paolo III, and the Emperor Carlo V, took under great consideration her literary, religious, and political view (Chemello 2016). A number of works, both in print and in manuscript, were dedicated to her, and the praises for her were uncountable (Ranieri 1985). The several, all unauthorized, editions of her *Rime*, printed when she was still alive and beyond, had a great success (Crivelli 2016). Selections of her poems circulated widely, copied in different internal order even before the printed editions came out. However, despite the enormous dissemination of her poems, the only manuscript collection of spiritual poems certainly assembled by the author was a gift manuscript for Michelangelo (Colonna 2005). This complicated editorial situation is one of the reasons because a proper and satisfying critical edition of Colonna’s poetry has yet to appear (Sapegno 2016b).

Colonna had the primacy in a number of achievements: In addition to being the first woman whose work was printed under her name, she inaugurated the genre of spiritual poetry as well as that of spiritual letters, which would have had a great success in the following decades. Moreover she was the first author for whom a commented edition of her poetry was written and printed by a contemporary scholar, in part when she was still alive (Sapegno 2016a, b). On the wave of her incredible success, other women such as Veronica Gambarà, Chiara Matraini, and Gaspara Stampa, just to cite the most famous, published their poems, but Vittoria Colonna was the only woman writer of her time to remain in the literary canon almost continuously until today, and whose name was never forgotten.

Comedy in Renaissance Literature

Laura Carotti

Scuola Normale Superiore, Pisa, Italy
INSR, Florence, Italy

Abstract

After centuries of condemnation by the Church, classical comedies were revived and staged in Latin or in translation at the courts and cities of the fifteenth century. However, in the sixteenth-century original theatrical productions in the vernacular appeared and flourished (mainly before the public of the courts), aiming to represent reality and its demystification with the aid of *contaminatio* between different literary genres.

Heritage and Rupture with the Tradition

The fifteenth-century rediscovery of the Latin texts of playwrights Plautus and Terence, soon staged in the original language or in translation, marked the beginning of a new flowering of comic theater, fallen into oblivion during the Middle Ages due to severe condemnation by the Church. The initial phase, characterized by the *imitatio* of classical theater, was followed in the sixteenth century by a period of intense and distinctive production of comedy in the vernacular. The highest comedy – as distinguished over the course of the century from popular comedy, presented by companies of amateur actors such as the “compagnie della calza,” composed of aristocratic devotees of the dramatic arts – arose in the setting of the courts to entertain nobles and lend prestige to princes and was increasingly perfected with regard to stage machinery.

First and foremost among Renaissance playwrights was Ludovico Ariosto, who drew situations and characters from classical comedies, ably re-adapted them to the changing social and cultural situation of the courts. His plays in prose and verse profoundly influenced the comic genre of the time, and he personally directed their staging at the court of Ferrara. Emblematic of Ariosto’s comic *vis* is *Cassaria*, a dramatic text in prose of 1508. As counterpart to its Latin heritage (mainly Terentian), it contains numerous references to contemporary life and reflects a new taste for the multiplication of intrigues and adventures.

In dispute with Ariosto, in 1513 Cardinal Bernard Dovizi of Bibbiena staged *Calandria* at the court of Urbino; it departed considerably from the Latin models, contaminated by the Italian tradition of short stories and in particular by the *Decameron*, and was programmatically proposed as “new” comedy for a world by now irremediably mutated from classical antiquity.

Also noteworthy were the productions of Anton Francesco Grazzini, called Lasca, author of lively plays written in the popular Florentine dialect anticipating several solutions of the seventeenth-century Commedia dell’Arte, and the anonymous *Venexiana*, probably written in 1535, distinctive for its anticlassicist alternation of literary Florentine, Venetian, and Bergamasco dialects and for the raw realism of its theme, an uninhibited love triangle.

Mention must be made of two authors who turned their backs on the cultural life of the court and fiercely criticized the rigid literary customs of the time: Pietro Aretino and Angelo Beolco, called Ruzante. Aretino wrote five comedies (*La cortigiana*, *Il marescalco*, *La Talanta*, *Lo ipocrito*, and *Il filosofo*) with a modern setting and realistic, even gloomy tones. But his theater was not only innovative regarding content; he also proceeded to destroy *ab interno* the traditional canons of the genre, reshaping them in a grotesque way to describe a world in disarray, lacking the comfort of religion and traditional values. Ruzante as well analyzed current issues in his comedies, such as the socio-economic crisis in which the Republic of Venice found itself; a distinctive connotation of his dramatic art was the use of Pavano dialect –

thanks to the expressive realism of this dialect, Ruzante succeeded in accentuating the features of his violent and bitter comedy.

To conclude this survey, thanks to the philosophical inspiration that pervades these works, *La Mandragola* by Machiavelli (1518) and the *Candelaio* by Giordano Bruno (1582) – that also influenced the flourishing of comedies in Elizabethan England – deserve a place at the forefront. The two philosophers describe a corrupt world dominated by profit and greed, and their primary goal is to represent, with ruthless and disillusioned gaze, the reversal of values afflicting the world around them – a world at the mercy of blind Fortune. With *Candelaio*, we may consider concluded the upward trajectory of sixteenth-century comedy: the schizophrenic proliferation of paratextual elements has “avant-garde” connotations that reflect the final “implosion” of this literary genre. Its heuristic capabilities now exhausted, and Renaissance comedy will give way to the fixed masks of the *Commedia dell’Arte*.

The rediscovery of classical theater and the great period of sixteenth-century Italian comedy encouraged the flowering of the comic genre in Europe. An example is the case of France, where Jean-Antoine de Baif’s comedies, modeled on Plautus’ and Terence’s themes, coexisted with *Eugène* by Étienne Jodeue (1552) a work of politico-religious propaganda, and *Les corrivaux*, a 1573 comedy by Jean de La Taille, who also gave us a translation of Ariosto’s *Il Negromante*. In Lutheran Reformation Germany, vernacular farces enjoyed great success (masterfully represented by Hans Sachs’ work) but there was also room for the erudite theater, influenced by Aristophanes and Plautus, of Nicodemus Frischlin, author of *Priscianus Vapulanus* (1578), and *Julius Redivivus* (1585). Popular farces were common in England as well, while at the same time court entertainment flourished, with its interludes and masques. A key date in English comedy is 1553, when Nicholas Udall wrote *Ralph Roister Doister*, taking themes from Plautus’ *Miles gloriosus* and inserting them into a rural and popular context. English comedy reached its peak with the extraordinary work of William Shakespeare: a tangible sign of a now-consolidated literary genre is the *Love’s Labour’s*

Lost, dating from circa 1593–1596, a true self-reflection on the value of the word and the compositional possibilities of comedy.

In Spain, Félix Lope de Vega y Carpio was the prolific author of many comedies – with historical, religious, mythological, and amorous themes – and of the *Arte nuevo de hacer comedias en este tiempo* (1609) in which he declares the need to leave behind Aristotelian precepts, recommending the fusion of the comic and tragic and sustaining the importance of the playful role played by the *gracioso*, an irreverent character. Finally, a masterpiece of Spanish comedy was *La vida es sueño* by Pedro Calderón de la Barca (1635) in which a careful reflection on reality offers the author an opportunity to strongly assert the existence of free will.

and pedagogical legacy, today it is his philosophical and theological works that are gaining increasing attention. These are represented mainly by the extensive treatise *De Rerum Humanarum Emendatione Consultatio Catholica* (*General Consultation on the Improvement of Human Affairs*), in which Comenius contemplates the ways to remedy the three basic human institutes (philosophy, politics, and religion) through the systematization of knowledge based on a new methodology, a new system of education, and a new universal language and through building new social organizations. Comenius' works as such were heavily influenced by eschatology, rejection of violence, and the pursuit of religious reconciliation.

Abstract

John Amos Comenius was a Czech theologian, philosopher, writer, and educational reformer. Although renowned primarily for his didactic

Biography

John Amos Comenius, a Czech theologian, philosopher, writer, and educational reformer, was born on 28 March 1592 in southeast Moravia, today's Czech Republic. The exact place of his birth is uncertain (it could have been Uherský Brod, Nivnice, or Komňa). His family belonged to the Unity of the Brethren, a Czech church, of which Comenius later became a bishop. In 1608 he began studying at a Latin school in the town of Přerov, which he left in 1611 for an academy in Herborn, where he met Johann Heinrich Alsted. He then continued his studies in Heidelberg, only to return in 1614 to Přerov to head the local Latin school. In 1616 he was ordained a preacher. After the defeat of the Czech uprising in 1621, Comenius was forced to hide in various places in Bohemia and Moravia because he refused to convert to Catholicism. In 1628 he fled Bohemia for Leszno, Poland, which became the center of the Brethren faith and a second home to Comenius. Between 1641 and 1642, Comenius visited London; in the

fall of 1642, he went to Sweden in order to implement a program of educational reform. Growing disagreements with the Swedish monarchy made him return to Leszno in 1648. In 1651 he accepted an invitation of the Hungarian prince Sigismund Rákóczi to Sárospatak in order to organize another educational reform. While living in Leszno once again between 1654 and 1656, a fire swept the city, destroying a large part of his unfinished work. Comenius spent his final years in the Netherlands (Amsterdam), where he took refuge at the invitation of Louis De Geer. Comenius died on 15 November 1670. He was buried in Naarden.

Innovative and Original Aspects

The first philosophical works of Comenius are largely influenced by the encyclopedism of J. H. Alsted. Like him, Comenius aspired to write a great encyclopedic work, but unfortunately his attempts, *Theatrum Universitatis Rerum* (1616–1618) and *Amphitheatrum Universitatis Rerum* (1624–1627), were never fully completed or survived as fragments only.

The time when Comenius was forced to hide in his own country is reflected in his writings of “consolation”: *Truchlivý (The Mournful)*, *Centrum Securitatis*, and *The Labyrinth of the World and the Paradise of the Heart* (1623).

Texts that would be philosophically significant began to appear only at the turn of the 1630s. It was then that Comenius began to believe that it would be feasible to reform contemporary knowledge. This conviction resulted in Comenius’ idea of pansophia (*all science*), materialized in *Pansophiae Praeludium*, *Conatuum Pansophicorum Dilucidatio*, *Pansophiae Diatyposis*, and *Via Lucis* (written in 1641). In these writings, Comenius presents his idea of a reform and unification of fragmented contemporary knowledge in a single science – pansophia – which would be a synthesis of philosophy and theology.

Comenius’ pansophic concept transformed into panorthotic (emendation) efforts in the 1640s. The pivotal aim of Comenius was no longer only to build a pansophia, but also to fully

remedy all of key human affairs (philosophy, religion, and politics). This is addressed in his masterpiece *De Rerum Humanarum Emendatione Consultatio Catholica*, which the philosopher worked on from 1644 until his death in 1670. Although the treatise was nearly completed, Comenius died before it could be finalized or published. In addition, shortly after his death, it was considered lost, and it was not until the 1930s that it was discovered. The Latin edition was published in Prague in 1966, and its Czech translation came out in Prague in 1992.

The philosophical core of *Consultatio Catholica* that Comenius laid out in seven interrelated volumes is introduced in the dedicative preface, where Comenius presents the nature and intentions of his work. He explains that it is an extraordinary attempt to remedy **contemporary knowledge** (*eruditio* or *philosophia*), **politics** (*politia*), and **religion** (*religio*). Comenius argues that universal remedy is only possible through collaboration, while all human affairs are remedied simultaneously. Another major point is, according to Comenius, to define what human affairs (*res humanae*) are. This question is addressed in the first of the seven volumes, *Panegersia*. Comenius discusses the definition of human affairs, but also their current sorry state and the need to awaken a desire for their remedy in humans. The second volume, *Panaugia*, contemplates the path that would facilitate success for the emendation efforts. The philosopher proposes focusing on examining three divine books (nature, mind, and *Scripture*) through the senses, reason, and faith, using three methods, the analytical, synthetic, and syncretic ones (the latter involving knowledge acquisition based on analogy between the created and the uncreated). The third volume of the treatise is *Pansophia*, which systematizes the new knowledge. Such corrected and organized knowledge empowers and binds us to contribute to its distribution among all people. The most appropriate means to achieve this is, as Comenius states, a universal language that all nations of the world would comprehend. Universal education, *Pampaedia*, and a universal language, *Panglottia*, thus constitute volumes 4 and 5 of *Consultatio*. Once all these conditions are met, we may

anticipate the emendation of philosophy, politics, and religion, as recounted in detail in the sixth volume, *Panorthosia*. The entire work would not be complete without the seventh, final volume, *Pannuthesia*, which encourages the reader to initiate the remedy.

Comenius' work was greatly influenced by his strong **eschatological** beliefs. In his view, this temporal world is coming to its end, and we must not postpone the remedy of human affairs any longer. This attitude is inextricably linked to Comenius' faith in new **revelations**, which only strengthened with advancing years. Testifying to this is their publication (*Lux in Tenebris*, *Lux e Tenebris*), as well as an unfinished manuscript of Comenius entitled *Clamores Eliae*, based on which the new revelations are extraordinarily important. The same work introduced the invention of the perpetuum mobile (*machynka*).

Comenius' work is highly valued also for the author's opposition to all forms of **violence**. In terms of confessional disputes, the thinker is generally regarded as representing non-confessional or **supra-confessional Christianity** (Válka 1994) for his attempts at harmonizing the differences between confessions. His late *Unum Necessarium* is eloquent in this regard, as Comenius himself viewed the tenth chapter as his intellectual testament. The text provides insight into his most intimate opinions: If inquired about his theology, Comenius would name the *Apostles' Creed*, with which he fully identified.

Apart from philosophy and theology, Comenius' thinking also greatly influenced **pedagogy**. Already in his early works, he highly valued the importance of education. He believed that no child should be excluded from education. Comenius tried to determine the conditions of schooling, including a number of practical aspects, and divide the educational process into phases. He pointed out the fact that education is a lifelong process – from the prenatal stage to the school of death – preparing us for eternal life. In particular his explanatory textbooks and encyclopedias, *Janua Linguarum Reserata* and *Orbis Sensualium Pictus*, became eminent. The pedagogical writings of Comenius were published all together as *Opera Didactica Omnia*.

Heritage and the Rupture with Tradition

The philosophical and theological work of Comenius greatly benefits from a broad intellectual base. The main source and the highest authority for Comenius is the *Scripture*, which he leans on heavily. The inspiration for his philosophical thought included St. Augustine (triadism, reception of the triad of nosse/scire – velle – posse), Nicholas of Cusa (triadism, the idea of coincidentia oppositorum, panharmony), Francis Bacon (efforts for knowledge emendation), Tommaso Campanella (three sources of human knowledge, the Neoplatonist concept of the universe), Johann Heinrich Alsted (encyclopediaism), and Johannes Piscator (eschatology).

Impact and Legacy

Comenius' work is especially appreciated for its didactic and pedagogical dimensions. Comenius is considered the predecessor of special education and developmental psychology (especially for the valuation of the uniqueness of children's psyche). Shortly after his death, Gottfried Wilhelm Leibniz commended Comenius' work. The philosophical dimension of his work could only be fully appreciated after his magnum opus, *De Rerum Humanarum Emendatione Consultatio Catholica*, was rediscovered (1934–1937). The twentieth century praised in particular Comenius' democratism and humanism and sought to find (although often rather unnaturally) analogies between Comenius' peace and irenic efforts, on the one hand, and the idea of the UN, international court or ecumenism, on the other hand.

Comets in Renaissance Science

Dario Tessicini
Durham University, Durham, UK

Abstract

The study of comets in the Renaissance is here presented from the viewpoint of the reception of ancient philosophical theories and of their interplay with astronomical observation and quantification. The ideas of prominent natural philosophers and astronomers are discussed in chronological order. Renaissance cometary theory is thus retraced through its intellectual shift from the Aristotelian meteorology to being a constitutive component of early modern cosmology.

Heritage and Rupture with the Tradition

At the dawn of the Renaissance, comets had long been conceived as meteorological phenomena similar in nature to the clouds, the rainbows, and the morning dew (Fig. 1). They all had in common their location in the terrestrial region, which extended from the center of the Earth to the lower border of the sphere of the Moon. Natural phenomena within this realm were taken to be unstable, transient occurrences owing their origin to conditions that we would now call “atmospheric,” a word that would come into use in the early seventeenth century (Martin 2015). The model of explanation for comets that was most widely accepted in the West from Late Antiquity to the end of the Renaissance was devised by Aristotle in his *Meteorology* (I, 6–7). His approach derived from the principles that inform his cosmology, as developed in *On the Heavens* and in *Physics* (Wilson 2013). The Aristotelian

cosmos is spherical and finite and is divided in two realms differentiated by both substance and motion. The celestial region comprises everything from the Moon to the sphere of the fixed stars and is composed by one perfect and unchangeable substance called ether. This is accorded perpetual circular motion and does not allow for any other change that is not of place. By contrast, the terrestrial region, nested within the celestial one and occupying the center of the universe, is the realm where substances generate and corrupt. Generation and corruption are produced by the interactions of the primary bodies (or “elements”) of which the sublunary sphere is formed, that is, earth, water, air, and fire. The elements have a common substrate and are mutually dependent. Moreover, they are affected by the motion of the celestial region and by the heat coming from the sun, both of which intervene in the formation of comets. Like clouds are formed by humid vapors exhaling from warm water, heated earth releases a hot dry exhalation which ascends to the upper regions of the terrestrial realm. Comets appear when the earthly exhalations reach the fiery region and ignite. The quantity of exhalation, the strength of the spark that ignites them, and the motion of the sphere of fire, which in turn depends on the circular celestial motion, determine the duration and the shape of the comet (*Meteorology*, I, 7, 344a8–25). While largely theoretical and conceived in harmony with physics, Aristotle’s cometary theory also takes into account direct observation. The appearance of several comets is recorded in the *Meteorology*, two of which at least were witnessed by Aristotle, who, in turn, links them to meteorological events, such as dry winters and northerly winds (Heidarzadeh 2008). The connection between comets and the earthly natural environment is explained by positing that comets, winds, and droughts are concomitants from the same causes, that is, the large concentration of dry exhalations in the aerial and fiery regions.

Scholastic and Renaissance philosophers accepted the main tenets of the Aristotelian meteorology, which became part of the medieval university curriculum, thus ensuring the transmission of the cometary theory. The principal interpreters

Comets in Renaissance Science, Fig. 1 Comets as meteorological phenomena similar to the halo, the Milky Way, and the rainbow. The illustration comes from a popular sixteenth-century textbook, confirming the transmission of the Aristotelian theory in the Renaissance. Woodcut from Gregor Reisch, *Margarita philosophica*, Freiburg im Breisgau: J. Schott, 1503, f. E2v

of Aristotle, such as Albert the Great, Thomas Aquinas, Agostino Nifo, Pietro Pomponazzi, Giacomo Zabarella, and Ludovico Boccadiferro, wrote commentaries on the *Meteorology*, and all of them invariably included sections on comets that perpetuated the Aristotelian doctrine, although occasionally with some variants and additions. Starting from the fifteenth century, however, the meteorological theory of comets came under increasing pressure from competing philosophies and new observations.

Ancient cometary theories different from, or actively opposing, Aristotle's were revived by Renaissance natural philosophers. Some ancient sources were transmitted, while critiqued, by Aristotle himself (*Meteorology*, I, 6). Among

them, there were the theories by Anaxagoras and Democritus, who took comets as mere optical illusions produced by the reflection of the combined light of two planets. Conversely, the Pythagoreans thought that comets were celestial bodies similar to planets, although seldom seen, while Hippocrates of Chios and his pupil Aeschylus speculated that the tail is not of the same nature of the comet's body, but is an optical effect produced by the light reflected by the humidity near the comet's body (Wilson 2013). Another source that did not align with the Aristotelian theory was the Latin Stoic philosopher Lucius Annaeus Seneca (4 BC – 65 AD), who speculated in his *Natural Questions* that comets were among the "eternal works of nature"

(7, 22, 1), a kind of celestial bodies whose course in the heavens still remained to be understood. Seneca was a unique and important authority for Renaissance cometology, as his account was the most extensive after Aristotle and provided powerful arguments against the theories of his predecessors, including Aristotle himself. Stoic doctrines were studied with renewed interest in the Renaissance and for some represented a theoretical alternative to the Aristotelian cosmology and physics. Sixteenth-century natural philosophers and astronomers, such as the French professor of mathematics Jean Pena and the German astronomer Christoph Rothmann, used Stoic arguments and doctrines in their works to contradict the Aristotelian theory. Particularly important for the later developments of the cometary theory is the work of Jean Pena. In his preface to Euclid's *Optics* (1557), he combined Stoic physics and Euclidean optics to argue against the Aristotelian doctrine of the elements and to deny the existence of the sphere of fire, the place where comets ignite according to the Aristotelian theory (Barker 2008). Pena also observed, in the wake of some of his contemporaries, that the tail of the comet always pointed away from the Sun, a sign that it may have been an optical illusion, and that the slow motion of some comets was incompatible with their sublunary position.

Innovative and Original Aspects

At the height of the Renaissance, comets became the subject of new investigations from the part of astrologers, astronomers, and physicians. Astrological concerns were often the main center of interest of the authors of works on comets and of their readers. A relevant part of cometary literature is astrological in nature. In this respect, comets were in the same category as other celestial signs, such as eclipses and planetary conjunctions, whose astrological interpretation could anticipate the occurrence of natural calamities, wars, and death of princes (Niccoli 1990).

In the fifteenth century, the Florentine humanist physician and astrologer Paolo Dal Pozzo Toscanelli (1397–1482) took regular observations

of comets along 50 years of activity. His attempt to chart cometary paths with respect to the fixed stars and to determine their position accurately was the first application in the Latin West of mathematical and astronomical techniques to the study of comets. Toscanelli did not elaborate on the consequences of his work in relation to the Aristotelian physical theory, but his work was taken up by the German astronomers Georg of Peurbach (1423–1461) and Johannes Regiomontanus (1436–1476), whose investigations became largely influential at a crucial time for cometology. Peurbach sought to determine the 1456 comet's distance from Earth by measuring its parallax. His findings were at odds with the Aristotelian theory, as the comet appeared to be located in the sphere of the air, and not in the fiery region. Regiomontanus continued and extended his master's work, improving the methodology of cometary observation and producing a work on parallax (the *Sixteen Problems Concerning the Magnitude, Longitude and True Position of a Comet*, published posthumously in 1531) that influenced the astronomers of the second half of the sixteenth century. On another front, the German astronomer Peter Apian (1495–1552) and the Italian physician Girolamo Fracastoro (c. 1478–1553) observed that the comets' tails always pointed away from the Sun. The regularity of this phenomenon could not be explained by the chance movements of inflamed exhalations. A solution to this problem came from optics. According to Apian, followed by others later in the century, the refraction of the sunlight affected the appearance of the tails. Girolamo Cardano (1501–1576) further elaborated this theory in his *De subtilitate* (Cardano 2004) and argued that the entire body of the comet was transparent and reflected the sun rays, which produced the optical effect of the antisolar tail. Cardano also believed that comets were located in the celestial region, as their motion was similar to that of the planets.

It was in the last quarter of the sixteenth century that the discussion over comets and other celestial novelties, most prominently the two supernovas of 1572 and 1604, brought about momentous changes to the consideration of comets as astronomical phenomena. In the wake

of the appearance of the new star of 1572 and of the comets of 1577 and 1585, the German astronomer Christoph Rothmann (c. 1560–1601) and the Danish Tycho Brahe (1546–1601) subverted the fundamental tenets of the Aristotelian cometary theory and of his celestial physics (Rothmann 2014). Their observations led to the conclusion that comets were located in the celestial region (Fig. 2). Not only the commonly accepted cometary theory was put into serious question, but also other fundamental cosmological concepts came under scrutiny, such as the inalterability of the heavens, and the celestial spheres that moved the planets and the fixed stars (Lerner 1997). In the following years, the matter of the heavens also became the subject of a wide philosophical debate that led to the abandonment of the Aristotelian quintessence (Granada 1996). From this point of

view, cometary observations offered a decisive input to the intellectual shift that marks the passage from the medieval to the early modern cosmology.

The early seventeenth-century debate on comets continued to address the questions of the location of the comets and of their nature, that is, whether they were transient occurrences, optical phenomena, or celestial bodies. Undoubtedly, the advent of the telescopic era in the 1610s opened up the possibility of new insights for cometary theory, but these did not come about until the mid-seventeenth century. In 1618–1619, the appearance of three comets sparked a heated debate between Galileo Galilei and the Jesuits, whose allegiance was to Brahe's theories on the celestial position and nature of the comets. Galileo replied first with a *Discourse on Comets* (signed

Comets in Renaissance Science, Fig. 2

Tycho Brahe's diagram of the motions of the comet of 1577. The comet moves together with the other planets, far removed from the terrestrial region. Also note the antisolar position of the tail (From Brahe (1610) (first edition 1588), p. 191)

by his friend, Mario Guiducci) and then with the *Assayer* (Galilei 2005). As he could not observe the comets directly, since he was bedridden at the time of their appearance, Galileo had to rely on his friends' accounts. However, the *Assayer* gained him considerable fame and intellectual credit, as well as powerful enemies. Galileo's position on comets was somewhat indebted to the Aristotelian meteorology, since he considered comets transient phenomena originated by the earthly exhalations and by the action of the sunlight. Differently from Aristotle, though, Galileo's comets were not fiery inflammations, but optical effects similar to the auroras (or "northern lights") moving straight upwards from Earth to the celestial region (Camerota 2004, 370). Around the same time as Galileo's activity, Johannes Kepler (1571–1630) engaged at some length with cometary theory. He supported a version of the optical theory according to which the comet's body is formed by transparent and perishable celestial matter (Kepler 1619). In turn, the tail is produced by sunlight refracted through the body, which releases its matter as a visible "effluvium" that, over time, completely depletes the comet's head. As for the motions of the comets, Kepler believed they moved rectilinearly and that only some comets were visible from the Earth (Boner 2013). Kepler was the last major thinker to support a cometary theory whose fundamental principles could still be brought back to the Renaissance period. Although there is no clear watershed moment in the cometary history from the Middle Ages to the early modern period, cometary theory after Kepler becomes more distinctively a product of the Scientific Revolution.

Impact and Legacy

In the early modern period, comets continued to capture the popular imagination, as well as being a subject of study for early modern natural philosophers (Schechner 1997). Both René Descartes and Isaac Newton continued the process of elaborating cometary theories based on data obtained through systematic observations and on quantification. In Newton's *Principia* (1689), the pinnacle of early modern science, comets are an integral

part of the celestial physics grounded on gravitational attraction. In fact, comets are considered to be a necessary element for the stability of the universe. Telescopic observations of comets begin to have a principal role only in the second half of the seventeenth century. While Johannes Hevelius' observations of the comet of 1652, that led to the publication of his *Cometographia* (1668), are still somewhat indebted to Brahe methodology and theoretical approach, John Flamsteed's work on the comet of 1680–1681 at the newly established Greenwich Observatory (1675) and Edmund Halley's discovery of the periodicity of the comet of 1682 ('Halley's comet') will project cometary theory into modernity.

Comic, the Renaissance Idea of

Laura Carotti
Scuola Normale Superiore, Pisa, Italy
INSR, Florence, Italy

Abstract

During the Renaissance, the comedian was a means of understanding the world, a structural element in the expressive quest to describe and expose reality. Thus he took on precise literary

traits – playful, farcical, bound to the sphere of the body – as well as profound theoretical connotations, as reflected in the poetry, theater, treatises, and novelistic genre of the time.

Innovative and Original Aspects

The Renaissance comedian offered a special key to unlocking our understanding of reality, its truthful description, and above all, the revelation of the mechanisms that intimately regulate it. The *serio ludere* – creating texts that had playful overtones but hid between the lines serious allusions to the events, usages, and customs of the time – allowed one to look at reality from an alternative, irreverent point of view.

In a poetic context, the anti-petrarchist and anti-classicist authors (and especially Francesco Berni) revived the tradition of comic-realistic poetry that originated in Tuscany during the age of the medieval communes and boasted poets such as Rustico Filippi and Cecco Angiolieri, bestowing new expressive vitality through corrosion of the most abused *topoi*. Thus, poetic compositions were an occasion for irreverent and skeptical satire and for reclaiming the carnal (even obscene) experience that “serious” poetry excluded a priori, and the comical and farcical became an important literary tool to show that literature should portray all of reality, even its basest aspects.

The importance given to the natural expressive needs, in order to upset our usual vantage point from which we perceive reality, also characterizes mock-heroic poems in Luigi Pulci's *Morgante* – whose final edition was published in 1483 – and even more so in *Baldus* by Teofilo Folengo, whose last edition appeared posthumously in 1552 (Folengo 1989; Pulci 1994). The old world of chivalry was now but a pretext for comic mockery aimed to emphasize that the chivalric values no longer existed, in an ethical universe that had changed completely and now found itself at the mercy of ineptitude and empty pedantry. Pulci's experience also provides an opportunity to understand the importance of the interplay between literature and philosophy in comic poetry. In the sonnet *Costor, che fan sì gran disputazione*, Pulci

uses traditional forms of comedy – for example, as derisive references to natural elements such as fruit – to ridicule the philosophical debates of Marsilio Ficino on the immortality of the soul (Pulci 2013).

In Folengo's *Moscheide*, a mock-heroic poem in elegiac couplets also printed in 1552, the story of the battle between the flies and ants in the pseudo-homeric *Batracomiomachia* becomes an occasion for scathing social satire (Folengo 1983).

Emblematic of the comedian in Renaissance theater is the opening motto of Giordano Bruno's *Candelaio*, printed in 1582: *In tristitia hilaris, in hilaritate tristis*. It is the union of comic elements with the tragic and disillusioned gaze that characterizes the highest expressions of Renaissance comedy, a union well summed-up in these words (Bruno 1993). In fact, they would later be considered by Luigi Pirandello in his 1908 work *L'umorismo*, exemplary of the "humorous" poetic attitude, which perceives and takes up the grotesque elements of reality to then construct a more complex reflection.

The revival of the tradition of Lucianist satire and the Hellenistic novel eventually led to the development of new forms of comedy. In *Encomium moriae* by Erasmus of Rotterdam, written in 1509 and published in 1511, the prosopopoeia of folly offers an alternative vantage point from which to observe the corruption and decadence of the Church and society, and in works such as *Momus* by Leon Battista Alberti, written around 1450 and printed in 1520, and *Spaccio de la bestia trionfante* by Giordano Bruno, published in 1584, following the manner of *serio ludere*, the clownish figure of Momus scourges the customs of the time (Alberti 1986; Bruno 2000; Erasmus 2015).

In conclusion, there are the special cases of *Le vie de Gargantua et de Pantagruel* by François Rabelais, printed between 1532 and 1554, where the preeminence of the body is a mockery of pedantry and hypocritically virtuous attitudes, and *El ingenioso hidalgo Don Quijote de la Mancha* by Miguel de Cervantes (1605), in which comic situations typical of the picaresque novel are used to gaze disenchanted at the

world and to reveal the unbridgeable gap between reality and the ideal (de Cervantes 2003; Rabelais 2006).

Commonplace

Eric MacPhail
French and Italian, Indiana University,
Bloomington, IN, USA

Abstract

Commonplaces hold the key to the relationship of dialectic and rhetoric, and they emerge into full prominence as Renaissance humanism begins to override the long dominance of scholastic methods and values. Whether understood in the etymological sense of common topics of

argument or in the looser sense of excerpts and quotations collected in commonplace books, or the headings under which such excerpts are organized for retrieval, the *loci communes* forged a cultural bond among Renaissance humanists and provided a conduit of thought and speech from antiquity to modernity.

Heritage and Rupture with Tradition

In the history of rhetoric and dialectic, commonplaces are the topics or places of argument by means of which one interlocutor may vanquish another in a verbal contest on any subject. In classical antiquity, Aristotle founded topics-theory in his *Topics*, and he extended this analysis to practical application in the *Rhetoric*, where Book 2, Chap. 23, rehearses 28 common topics or argumentative strategies useful in treating a wide range of subject matters in all three rhetorical genres: demonstrative, deliberative, and forensic. Aristotle's treatment of the places of argument implies that all of his topics can be turned both ways, to prove the affirmative or the negative of a given proposition, thus sharpening the double-edged sword of rhetoric. Cicero systematizes Aristotle's topics for use in Roman forensic oratory in his own *Topica*. One of the topics he adapts from his model is the argument from contraries, and the example he offers is rife with literary potential: if folly is to be avoided, wisdom is to be sought after (*Topica* 47). Reverse the premise and you get *The Praise of Folly*. In the *Brutus*, Cicero, on Aristotle's authority, reports the pre-Socratic genealogy of the commonplaces, identifying the sophist Protagoras of Abdera as the first to prepare opposing speeches on notable themes, “which are now called commonplaces” (*Brutus* 46). This testimony forever associates *loci communes* with the stigma of sophistic rhetoric. Quintilian further catalogues the common places of argument, or places from which arguments are to be sought, in Book 5, Chap. 10 of his *Institutio oratoria*, whence they flow, after a long interlude of scholastic obscurity, into Lorenzo Valla's *Dialectical Disputations* of the mid-fifteenth century. Valla along with his

pedagogical vulgarizer Rudolph Agricola, author of a treatise *On Dialectical Invention*, have been credited with engineering a major shift in emphasis in the history of logic from strict syllogistic reasoning to topics-theory (or more schematically, from scholasticism to humanism) that came to fruition in the sixteenth century (Jardine 1988). This shift, in turn, would draw dialectic closer to rhetoric through their shared places of argument.

Innovative and Original Aspects

At the same time, commonplaces, as Ann Moss has shown, began to assume a new meaning and a new function in humanist schooling and indeed in the “structuring of Renaissance thought” (Moss 1996). The key text in this process of innovation is Desiderius Erasmus’ rhetorical textbook *De copia* or *On abundance of words and things*, where we can see the creative interference of competing senses of the term locus or place. After treating copia of words, Erasmus turns to copia of things as a tool for transferring classical culture from what we read to what we write. Readers should collect commonplaces, in the sense of anecdotes, examples, and pithy sayings, and arrange them under antithetical headings or places in a personal notebook. These places or rubrics can in turn be treated according to all the places of argument, understood as answers to the basic questions of definition, cause, effect, time, etc. With a characteristic indifference to pedantic distinctions, Erasmus blends his places in order to facilitate the circulation of commonplaces in Renaissance culture. But that is another story.

Commonplace Book

Earle Havens

Department of Rare Books and Manuscripts,
Sheridan Libraries, Virginia Fox Stern Center for
the History of the Book in the Renaissance, Johns
Hopkins University, Baltimore, MD, USA

Abstract

Commonplace books emerged out of a range of classical Greek and Roman literary practices of gathering and organizing fragments from different texts and miscellaneous excerpts deemed to be useful, wise, or otherwise memorable in abstracted forms. Intellectually, these *loci communes*, or “commonplaces” of

knowledge, were rooted in Aristotelian topical philosophy, Greco-Roman rhetorical methodology, and popular readerly metaphors such as that of the busy bee gathering nectar from various flowers to make honey. During the Middle Ages collecting commonplaces was largely absorbed by a broader medieval encyclopedic tradition of theological and philosophical canons and authorities assembled in *florilegia* and especially useful to preachers. In the Renaissance, the more broadly conceived ancient rhetorical tradition of *loci communes* reemerged, particularly within the curricular reforms of classical moral and rhetorical education. From the early sixteenth century onwards, the commonplace book was also adapted as a pragmatic mnemonic tool for organizing literary excerpts, as well as professional theological and legal texts.

Ancient Philosophical Foundations and Medieval Innovations

The theoretical foundation of “commonplaces” (Greek, *koinoi topoi*; Latin, *loci communes*) – denoting notable places and themes of philosophical discourse – derived from the further development and application of Aristotelian logic, rhetoric, and dialectic. In the *Topics*, Aristotle enumerated specific philosophical “locations” or “places” of dialectical argument and reasoning that could be applied usefully by the philosopher to any number of individual arguments: “accident,” considerations of “better” and “worse,” “genus,” essential or permanent versus temporary or relative “properties,” etc. In Aristotle’s *Rhetoric*, this same general concept was applied to the practical art of persuasion; the places of rhetoric constituted broadly applicable headings of argument under which various enthymemes could be applied by the rhetor.

The early colloquial association of these elements of dialectic and rhetoric with specific places or locations of knowledge also invoked the ancient mnemonic tradition of linking specific forms of information to visualized places within the mind set out in the *Rhetorica ad Herennium*, Cicero’s *De oratore* and Quintilian’s *Institutio oratoria* (Moss 1996, 6–10). In these later Roman contexts, pragmatic rhetorical lists of *loci communes* were recommended, many times in conventional combinations: e.g., definition and etymology, cause and effect, genus and species, consequents and antecedents, qualities and quantities, contraries and adjuncts, etc. While expounding on such *sedes argumentorum*, or “seats of argument,” Cicero did not discourage the rhetorician from deploying lesser forms of argument and persuasion, such as rhetorical appeals to classical *auctoritates* (authorities). Carefully chosen and applied *sententiae* from the received wisdom literature of the most approved ancient authors could be enlisted to help “authorize” an argument by appealing to the fame and personal credit of its inventor, in addition to the eloquence, concision, and self-evident moral virtue of the commonplace itself. Quintilian elaborated further on these great authorities worthy of quotation, appropriation, and imitation within the context of a prescribed course of study, which included the Attic orators Demosthenes, Lycurgus, and Aeschines, as well as Cato the Elder and Cicero.

In parallel there emerged idiosyncratic Hellenistic and Roman works that loosely resembled these idiosyncratic methods of organizing *loci communes*. Not always designed to aid in dialectic or persuasive oratory, such works could offer an eclectic and semi-encyclopedic exposition of a given subject. Alternatively, they might simply entertain readers with a curiously arranged *copi*a of clever and pleasing thoughts and memorable phrases. Pliny the Elder’s *Historia naturalis* is perhaps the most famous exemplar, offering up little new information about the natural world but rather supplying a thorough assemblage and synthesis of scores of ancient Alexandrian paradoxologies, which Pliny consulted and collated in the course of his research and writing. Others,

like Aulus Gellus's *Noctes Atticae*, were arranged more casually still presenting colorful conversation pieces as a loose anthology, which was only nominally organized into 20 separate books. Here the reader's titular "Attic lucubrations" were not so much preoccupied with the best philosophers. Preferring spontaneity at the expense of system and variety over homogeneity, Gellus's sundry ruminations encompassed little-known antiquarian curiosities and peculiar archaizing literary fragments. Aelian's *Varia historia*, a slightly later third-century CE admixture of purple passages, lists, biographical details, mythographic curiosities, and various wonders of nature and human invention, was written in a similar spirit; so, too, was the contemporary *Collectanea rerum memorabilium* (Collection of curiosities) of Solinus, though he was at least consistent in his focus on ancient "wonders" borrowed largely from Pliny the Elder, Suetonius, and Pomponius Mela, among others.

These classical philosophical-rhetorical foundations and accumulations of textual miscellanies were themselves synthesized and popularized in numerous memorable metaphorical passages about the art of collecting sententiae within canonical works of classical literature whose literary tradition would resonate throughout the Middle Ages. The *locus classicus* was the oft-quoted anecdote of the *Epistulae morales* of Seneca the Younger, which merits quotation due to its persistent reiteration elsewhere:

We also, I say, ought to copy the bees, and sift whatever we have gathered from a varied course of reading, for such things are better preserved if they are kept separate; then, by applying the supervising care with which our nature has endowed us . . . we could so blend those several flowers into one delicious compound that, even though it betrays its origin, yet it nevertheless is clearly a different thing from that whence it came (2:84.3–9).

Seneca recasts the roles of the reader and author in a manner that would greatly appeal to the Renaissance humanist interest in literary imitation and invention representative of a thorough mastery of classical Greco-Roman moral and philosophical exempla. Both categories of *imitatio* and *inventio* were enlisted in the collation of one's own

curriculum of reading but whose result belonged exclusively to the taste and *virtù* of the gatherer. The commonplacing reader's discrimination, rigor, and connoisseurship combined to engender a literary tertium quid possessed and reflective of its own creative merit. This same metaphorical sentiment of commonplacing would become a commonplace in its own right, for example, in the preface to Macrobius's *Saturnalia* (1:1. praef.2–6). The readerly honeybee topos charged the imaginations of influential Renaissance authors, whose works would also come to embody elements of the loci communes tradition. Like-minded echoes appeared in Desiderius Erasmus's lively encomium to the learned daughters of Sir Thomas More in the *Commentarius in nucem Ovidii*: "As they flit like so many bees between Greek and Latin authors . . . you would swear you were watching the Muses at graceful play in the lovely pastures of Mount Helicon, gathering flowers and marjoram to make well-woven garlands" (Erasmus 1969, 1.1, 146; Moss 1996, 114, 300). The *Essais* (1580) of Michel de Montaigne, which were richly laden with classical commonplace quotations, included "Of the Education of Children": "The bees plunder the flowers here and there, but afterward they make of them honey, which is all theirs: it is no longer thyme or marjoram. Even so with the pieces borrowed from others; he will transform and blend them to make a work that is all his own, to wit, his judgment" (Montaigne 1992, 1.26.111).

The Middle Ages present a broad set of recombinant approaches to these various strains of classical loci communes. Pliny the Elder's natural philosophical synthesis presaged a sequence of ever more expansive compendia of universal knowledge, from the early seventh-century *Etymologiae* of Isidore of Seville to the vast *Speculum maius* of Vincent de Beauvais in the mid-thirteenth century. The latter was to stand as a mirror not only of all things natural (*naturale*), but also of all times (*historiale*) and all the arts of theoretical knowledge (*doctrinale*). Such ambitious omnium-gatherum enterprises, as these would supply generations of glossators, homilists, scholiasts, and compilers of the major *distinctiones* – lexicons of biblical symbolism

regarding things *in bono et in malo*, often arranged alphabetically – with a seemingly limitless fund of subject matter of universal reference, fitted for the widest practical and philosophical applications.

A less comprehensive but extremely popular adjunct to these medieval encyclopedias were the florilegia (lit. “books of flowers”) formed as collections of auctoritates organized under particular topics and themes. They presented practitioners of the *artes praedicandi* (the arts of preaching) with a host of ready references capable of digesting several of the most general, and several of the more abstruse, theological concepts for the consumption of the laity in strings of thematically arranged passages from the scriptures and church fathers. Of these, many could be usefully cited, including the relatively early *Florilegium gallicum*, which excerpted particular passages from various canonical works *in seriatim* in the manner of a digest. Over time, these early florilegia were themselves excerpted and gathered together, with still more notable passages from other authoritative sources arranged under thematic headings like the *Floretus*, sometimes ascribed to Bernard of Clairvaux. All manner of titular terms and categories would be assigned to these sorts of practical texts variously suggestive of their many potential purposes, whether as rich and colorful sources of rhetorical copia, as well-digested stores of wise sayings, or as a ready supply for formal apology and polemic: *sylva*, *thesaurus*, *polyhistor*, *theatrum*, *pharetra*, and so on.

While many of the great medieval encyclopedias were constructed according to iterative classifications of knowledge within conventional theological categories, and ever more complex and ramified subcategories (requiring increased reliance by their readers on elaborate tables and indices for practical use and reference), many compilers of medieval florilegia adopted simpler, user-friendly formats. Thomas of Ireland’s popular *Manipulus florum* (handful of flowers) eschewed encyclopedic complexity for something approaching a latter-day “book of quotations” simply by listing a sequence of canonical themes in alphabetical order and populating them with

many of the more familiar quotations from patristic and medieval authors. Thus the entry *De gaudio* (Of joy) lists germane quotations from Augustine, Jerome, Gelasius, Gregory the Great, and Bernard of Clairvaux; but at least one fifteenth-century copy was customized further with numerous scribally reproduced additions from Petrarch’s *De remediis utriusque fortunae* within the ample blank spaces of the same page of the manuscript (Yale, Beinecke Library, MS 380; Havens 2001, 21).

The turn from a nearly exclusive reliance on biblical, patristic, and otherwise theological sources to more humanistic gatherings of quotations from ancient Greco-Roman sources was a gradual one and was largely, though not exclusively, restricted to the fourteenth and fifteenth centuries. Notable among these was the Paduan “pre-humanist,” Geremia da Montagnone’s *Epytoma sapientie* (written c. 1310, printed 1505), a traditional moralizing collection that leavened the traditional sententiae of the Doctors of the Church with pagan passages from Catullus, Cicero, Isocrates, Juvenal, Lucan, Macrobius, Martial, Ovid, Plato, Quintilian, Sallust, Seneca, Statius, Valerius Maximus, Virgil, and many others. In early printed editions of Montagnone, these passages were sometimes modified with parenthetical caveats to the reader as “*proverbia vulgaria*,” or the “vulgar proverbs” of pagans. Other more eclectic compilations of Christian and pagan *loci communes* would emerge throughout the Quattrocento that were increasingly free of such conservative anxieties. Indeed, the very first dated book printed in England was William Caxton’s *Dictes and sayings of the philosophers* (1477) – an English translation from the French of maxims excerpted by an eleventh-century Arab reader of ancient Greek philosophers.

Renaissance Education and Humanist Prescriptions

Reforms in Renaissance educational theory regarding dialectic and rhetoric once again elevated the classical *loci communes* to the position of a fundamental organizing principle within the

broader mastery of Latin eloquence. Following the seminal influence of Petrarch, great advances were made in fifteenth-century Italy through the many contributions to the *studia humanitatis* by Gasparino Barzizza, Guarino da Verona, Vittorino da Feltre, Lorenzo Valla, and their contemporaries and immediate successors. As Marsilio Ficino would exclaim in a letter to Paul of Middleburg: “This age, like a golden age, has brought back to light those liberal disciplines that were practically extinguished: grammar, poetry, oratory, painting, sculpture, architecture, music and the ancient singing songs of the Orphic Lyre” (Ficino 1576, 944). As these scholars and educators focused increasingly on the particular attributes of rhetorical sophistication in ancient Greco-Roman authors – and their allied capacity to articulate and teach particular moral and philosophical themes – a renewed pedagogical practice emerged in the schools that encouraged students to collect sententiae systematically and to organize them thematically for future reference and use.

Latin vocabulary, tropes, and figures were often introduced to students in the form of lists – metaphor, metonymy, synecdoche, onomatopoeia, parenthesis, etc. – accompanied by rhetorically sophisticated textual examples from classical sources. Agostino Dati’s *Elegantiolae* (c. 1472), a much reprinted textbook of the later Quattrocento, enumerated two hundred *praecepta* of Latin syntax, followed by a second section of substantive moral *loci communes* (“*flosculorum*”) – *aequitas*, *iustitia*, *copia*, *fortuna*, *ius naturae*, *pietas*, etc. – cross-referenced with specific ancient sources. The commonplaces of rhetoric and dialectic were, in this way, inextricably mirrored in commonplaces of moral excellence. Further adaptations would appear along more elaborate lines among ultramontane scholars such as the Dutchman Rudolphus Agricola, whose best-selling *De formando studio* (1484) remained a great influence on both sides of the Alps for at least a half-century. Therein the Dutch humanist addressed the formation of a student’s private course of study and acknowledged that mere rhetorical skill must not be an end in itself. Rather, facility

and eloquence in Latin were the essential means of a far more comprehensive moral philosophical attainment. The proper objects of this integrated pedagogical model were diverse, encompassing poetry, history, oratory, ethics, and, of course, theology, in addition to canonical philosophical texts.

However high-minded Agricola’s educational reforms, his recommended method for composing philosophical arguments was entirely practical: the student had first to undertake an initial phase of textual compilation and cross-referencing suited to his interests and to build a rich and versatile fund of material from which to work. Agricola suggested arranging and cross-referencing these according to traditional moral themes – virtue and vice, life and death, etc. – though not restricting oneself to these alone. His model was expansive, resistant to the conventional theological themes that predominated in medieval florilegia. First collecting and creatively juxtaposing the wisdom literature of the ancients around specific themes, the student-philosopher would then filter them through the classical commonplaces of rhetoric and dialectic: causes, effects, conjugates, antecedents, etc. Agricola’s form of study was essentially tripartite: read widely, compile commonplaces selectively, and then shape the raw material of that investigation and discovery into moral knowledge through deliberative, sophisticated classical Latin compositions intended to persuade and to elevate (Moss 1996, 74–80). The influence of Agricola’s prescriptions cannot be underestimated, as is well reflected in the repeated appearance of *De formando studio* in printed anthologies of other equally popular humanist pedagogical treatises along similar themes by Desiderius Erasmus and Philipp Melanchthon (Erasmus 1971, 1.2.; 1988, 1.6; Melanchthon 1521).

Agricola’s fellow countryman Erasmus elaborated greatly upon the seemingly endless possibilities presented by the properties of literary copia in his 1512 pedagogical work combining the handbook *De ratione studii* with his more detailed *De utraque verborum ac rerum copia* in which he recommended a still more expansive deployment of commonplaces. Beneath each of those was to

be placed a secondary layer of binary divisions consisting of similars (*affinitatis*) and opposites (*pugnantiae*) in the manner of pithy descriptions, such as adages like “Make haste slowly,” or conventional philosophical questions such as “Is the active life superior to the contemplative life.” Further beneath each of these, the exercitant was then instructed to compile apposite quotations and anecdotes in a manner not dissimilar to Erasmus’s own lifelong accumulation and composition of *Adagia* (1508–36), which, like his *De copia*, counted among the runaway pedagogical best sellers of the sixteenth century. Sententiae were not mere tools for the elaboration of rhetorical commonplaces. They had been elevated to the status of commonplaces for argument in their own right – the accumulated wisdom literature of the ancients, now revived and ingeniously redeployed as fundamental building blocks of the studia humanitatis.

Erasmus’s younger contemporary Philipp Melancthon would go on to redeploy the commonplace book tradition in the dual service of education along similar if also more expansive grounds as well as in the generation of cross-confessional polemic. His influence in these precincts, particularly in the Protestant world, dominated much of the middle decades of the sixteenth century. Indeed, it is perhaps no coincidence that one of his very first systematic expositions of reformed evangelical Lutheran theology was entitled *Loci communes* (1521), taking the form of a stridently anti-Catholic and controversial theological commonplace book. Others working for the same Protestant cause went so far as to produce large folio commonplace books with simple theological commonplace headings printed at the top of large blank pages to be filled in later by tireless theologians or pamphleteers. The English printer John Day did just this in 1572 according to a scheme presented by the martyrologist John Foxe. However, the resulting enterprise appears to have been an abject failure, for Day later trimmed and recycled many of the unsold sheets for use in other more popular Protestant works that, nonetheless, still preserve trimmed glimpses of Foxe’s original headings (Foxe 1572).

Further Applications of the Commonplace Book in Renaissance Europe

Clearly, by the sixteenth century the commonplace book had emerged as something of a ubiquity among the educated classes of Europe and would naturally go on to inform further applications in many of the professional disciplines and in the study of the liberal arts more generally. Such crossover was often affected by humanist scholars with literary pretensions, such as Antonio Mancinelli, the pedagogue and glossator of classical Roman texts and the compiler of a literary commonplace book *De poetica virtute* (c. 1499). No doubt a student of Agricola’s works, Mancinelli demonstrated the morally edifying elements of ancient pagan Roman literature within the context of contemporary Catholic culture, seeking to syncretize the two traditions with a minimum of controversial commentary. By listing apposite quotations from Aristotle, Cicero, Quintilian, and others under conventional commonplace headings of particular virtues that were just as often treated as Christian, the commonplace book format was left to “speak for itself.”

Other exemplars followed, among them the Phillipist theologian Georg Maior’s *Sententiae verterum poetarum* (1534) and Ottaviano Mirandula’s *Illustrium poetarum flores* (1538). The full title of the latter indicates its organization “*in locos communes digesti*” (a frequent attribute in titles of works directly inspired by the commonplace book tradition) with a wide range of quotations from Catullus, Plautus, Propertius, Terence, Tibullus, and Virgil. Great prominence was given to this subgenre of literary activity by the natural philosopher Conrad Gessner when he applied his love of encyclopedic compilation to ancient Greek verse and prose extracts arrayed in the manner of a commonplace book. His *Sententiae ex thesauris Graecorum delectae* (1543) was, in essence, an edition of the late antique *gnomologia* of Johannes Stobaeus made more useful to a latter-day audience. Nor were literary verse and prose compilations arranged under commonplace headings restricted to ancient texts. In the later context of the English literary

Renaissance, compendia of contemporary vernacular verses were similarly compiled in the first printed poetical anthologies of the Elizabethan period, notably in Francis Mere's *Palladis Tamia. Wits treasury* (1598) and Robert Allott's *Englands Parnassus, or The choysest flowers of our modern poets* (1600).

Far more pragmatic developments in the commonplace book tradition appeared in other pedagogical contexts, most notably in the law. In a field where capaciousness of memory was highly valued, particularly in the customary traditions of the English common law, commonplacing was widely applied throughout the later sixteenth and seventeenth centuries, culminating in works such as William Phillips's primer *Studii legalis ratio* (1662) and Matthew Hale's adaptation of the earlier work of Henry Rolle into a comprehensive commonplace book of the English common law, *Un abridgement de plusieurs cases et resolutions del common ley* (1668). However, the post-Renaissance legacy of the commonplace book is most closely associated with the philosopher John Locke's influential and frequently employed system for indexing commonplace books, *A new method of a common-place-book* (1706). There he recommended a method that resolved the natural problems that arose through the compilation of disparate passages under various headings over time. Compilers could easily run out of space under a particularly favored theme and be forced to move one to another page somewhere else in their blank books or even to successive volumes. According to Locke's method, a space is given for each letter of the alphabet in a summary index, and beside each letter is listed each of the five English vowels. Take a commonplace in your book, such as "Virtue," and then place the page numbers wherever relevant entries appear and simply record them in the slot for "Vi-." Blank commonplace books with prescribed headings like John Day's would reappear in print during the eighteenth century with printed versions of Locke's ingenious index.

Exemplary printed commonplace books arranged in the Renaissance tradition had declined considerably by the later decades of the

seventeenth century. They were displaced, in part, by the encyclopedic movement of the early Enlightenment represented by such works as Daniel Georg Morhof's *Polyhistor* (1688–92) and Ephraim Chambers's *Cyclopaedia* (1728). Personal commonplace books would nonetheless continue to be compiled in manuscript form well into the modern era, much as they had been throughout the Renaissance.

Complexion, Temperament, and Four Humor Theory in the Renaissance

Elisabeth Moreau

Department of History, Faculty of Philosophy and Letters, Fonds de la Recherche Scientifique – FNRS/Université Libre de Bruxelles, Brussels, Belgium

Abstract

A central concept in Galenic medicine, the temperament designates the state of health resulting from the balance of the four humors: blood, phlegm, yellow bile, and black bile (or melancholy). Produced in the liver during digestion, the humors stem from the mixture of the primary qualities (hot, cold, dry, and moist) related to the four elements (air, fire, water, and earth). The notion of temperament was fundamental for theoretical and practical medical branches, from physiology and pathology to therapeutics and dietetics. It defines the physical constitution of all living beings as well as food, drugs, and natural things in general. In therapeutics, the patient's humoral imbalance is cured by a qualitatively "contrary" remedy, an appropriate diet or by surgical means such as bloodletting and clyster. Because temperament also involves the mixture of elements, it gave rise to long-standing debates in medieval and Renaissance philosophy about the status of the elements in the compound, in particular their qualities, matter, and form.

Heritage and Rupture with the Tradition

Throughout his works, Galen established the notion of temperament by merging into a

systematic theory the Hippocratic approach to humors and qualities in *On the Nature of Man* with Aristotle's physics of elements and mixture in *On Generation and Corruption* (Jouanna 2012; Hankinson 2017). In this perspective, the Galenic tradition aligned the four humors with the four elements and their qualities, and more broadly with the four ages of the human being and the seasons (Nutton 2004; Siraisi 1990). According to Galen's *On Mixtures*, the temperament varies from one individual to another within the same species and is determined by the standard of "well-temperate" median state (*eukraton*), which is specific to each species of plants and animals. Such a canonical model of "just" temperament (*ad justitiam*) is a proportionate mixture of the four qualities. From this model derive eight variations including four simple temperaments with one prevalent quality, and four compound temperaments with two complementary qualities (Galen 1997).

On that basis, scholastic physicians developed sophisticated explanations of the complexional variations of living beings, body parts, and drugs (Ottosson 1984; French 2001; McVaugh 1975). In order to map the multitude of temperaments in the physical world, the temperaments of living beings were classified following an intensity scale of qualitative degrees, which were associated with the Galenic definition of "latitude of health." The numerous variants of temperaments were integrated into the framework of four humoral complexions corresponding to the four compound ones: "sanguine" (hot-moist), "bilious" (hot-dry), "phlegmatic" (cold-moist), and "melancholic" (cold-dry). Furthermore, the discussions on complexion opened on diverse interpretations of the Aristotelian concept of mixture. They questioned the permanence of the elemental forms in the compound and the nature of the substantial form of the "mixt," as testify the accounts of Avicenna, Averroes, and Thomas Aquinas, among others (Maier 1982). Such a doctrinal background is patent in the medical terminology of temperament designating either the process of mixture (*commixtio*) or its temperate product (*complexio*) (Jacquart 1985).

In the late Renaissance, the medical philosophy of Jean Fernel spread the idea that the temperament of living beings not only results from the

blending of the four elements but also involves a celestial entity related to the body's life, innate heat, and substantial form. When subject to violent affections such as epidemics and poisons, this life principle requires a specific therapy alternative to the Galenic cure by contraries (Fernel 1567). For its Platonic interpretation of Galen, Fernel's account of temperament was widely discussed by early modern physicians (Hirai 2011; Richardson 2018). Moreover, followers of Paracelsus like Petrus Severinus challenged the Galenic notion of temperament on the basis that it endorses the mixture of elements as perishable and sterile material units. Instead, they established that the physiological functions and diseases stem from alchemical processes operated by three principles (Salt, Sulfur, and Mercury) which are rooted in incorporeal and celestial seeds. Nonetheless, many alchemist physicians such as Joseph Du Chesne and Daniel Sennert proposed a compromise by reuniting Fernel's theory of temperament with Paracelsian alchemy.

Compton, Thomas

Born: Cambridge, 1591

Died: Liege, 24 March 1666

Victor M. Salas

Sacred Heart Major Seminary, Detroit, MI, USA

Abstract

Thomas Compton Carleton, S.J., was a seventeenth-century English Jesuit philosopher-theologian. His major philosophical work, the *Philosophia Universa*, is a model of Jesuit pedagogical practice insofar as it stays true to a fundamentally Aristotelian vision of philosophy, as required by the Jesuit *Ratio Studiorum*, but expresses originality in its theses and tenor.

Biography

Thomas Compton Carleton, S.J. (Cambridge, 1591; Liege, 24 March 1666), was a Jesuit philosopher-theologian who was born at the end of the sixteenth century in Cambridgeshire, England (Doyle, p. 4). In 1617 he joined the Society of Jesus and began his formation at the English College in Douai, France. Carleton was ordained a priest there in 1622 and later, in 1625, returned to his native England where he eventually took his fourth religious vow on 21 May 1628. He returned to France to teach literature in the Jesuit College at St. Omer, near Calais. Late in 1639 Carleton left for the Jesuit College in Liege where he was a professor of philosophy, then theology, followed by sacred scripture (Doyle, p. 4).

During his time in Liege, Carleton authored his *Philosophia Universa* [PU] (which would later be republished posthumously in 1697 as the *Cursus philosophicus universus* [McCormick, p. 80]). As the title suggests, this work covered the entire spectrum of philosophical topics including logic, metaphysics, physics, generation, corruption, the heavens, and the soul. After giving some preliminary definitions of logical terms such as subject, predicate, copula, discussions of kinds of proposition, and rules for syllogistic reasoning (fols. 1–27) in his introduction to logic that runs for seven disputations, Carleton composes a much lengthier *Disputationes in universam Aristotelis Logicam*, which ranges over 50 disputations (McCormick, p. 80). As the nature of the topics Carleton treats indicates, he was largely taking his direction from Aristotle's own philosophical outlook, although the Jesuit is by no means a slavish commentator on the Stagirite's work. Rather, as some have suggested, Carleton's pedagogical commitment to the Jesuit *Ratio Studiorum*, which mandates that in things philosophical the thinking of Aristotle should be followed, is clearly at work (McCormick, p. 80).

Like many other Jesuit scholastics from the sixteenth and seventeenth centuries (e.g., Fonseca, Suárez, Lynch, Semery, Wietrowski), Carleton also address the issue of super-transcendentality. He does so in the context of his logic, more specifically in his treatment of

the nature and division of terms (*de divisione terminorum*), which fall into one of the following: “transcendental, supertranscendental, and non-transcendental” (*PU*, d. 2, s. 6, n. 5; fol. 8). Transcendental terms, explains Carleton, are those that can be said of everything and are the standard six: “*res, ens, verum, bonum, aliquid, unum*” (ibid.). Supertranscendental terms, however, are those that can be said of more than only “real things” and can be “affirmed of fictions” (ibid.). Here, Carleton has in mind the “imaginable” and the “possible” (ibid.). Later in his *Philosophia Universa* in a discussion of *ens rationis*, Carleton goes so far as to suggest that beings of reason, though they do not have “physical” or “real” existence, have “intentional existence” effected by the intellect (ibid., d. 15, s. 3, n. 6; fol. 75). This intentional being would thus be considered supertranscendental according to the divisions established earlier (cf. Doyle). Finally, non-transcendental terms are those that have a “limited signification and essence,” such that they do not extend to all things but only to some, such as “man, horse, lion, etc.” (*PU*, d. 2, s. 6, n. 5; fol. 8).

Also noteworthy with the *Philosophia Universa*, published only a year before René Descartes’ death, is the fact that in it Carleton offers occasional criticisms of the Father of Modern Philosophy (McCormick, p. 80). These criticisms are largely directed to a perceived lack of clarity in expression and Descartes’ ambivalence in the positions he takes, which philosophical commitments seem to be more a matter of political expediency rather than philosophical commitment (ibid.). Also, in matters pertaining to physics, Carleton thinks Descartes has gone too far in dissolving the notion of “substantial forms” and he even offers theological reasons for finding problematic Descartes’ rejection of accidental forms (ibid., p. 81).

Carleton followed his *Philosophia Universa* with a work devoted to ethics in 1653, the *Prometheus Christianus seu liber moralium*, and a two-part theological treatise, *Cursus theologici: tomus prior* (1659) and *tomus posterior* (1662). Only a few years after his publication of this last work, Carleton died in Liege on 24 March 1666 (Doyle, p. 4).

Concept of Seeds

► Seed Concept in the Renaissance

Concordia

Francesco Borghesi
 University of Sydney, Sydney, NSW, Australia

Abstract

This entry analyzes the notion of philosophical concord (sometimes with that of peace so often inextricably associated with it) in the Renaissance by providing a glance at the thoughts of five influential thinkers between the fourteenth and the sixteenth century. Rather than taking into consideration the historical milieu in which such notion propagated, it traces its evolution across the most relevant works by Ramon Llull (1232–1316), Nicholas of Cusa (1401–1464), Giovanni Pico della Mirandola (1463–1494), Desiderius Erasmus (ca. 1468–1536), and Joan Lluís Vives i March (1493–1540).

Innovative and Original Aspects

The idea of concord (*concordia*) intended as a political and religious concept rooted in philosophical and theological speculation and as a development in Western thought of the Greek term *homonoia* (opposed to that of *stasis*) can be observed in five influential late medieval and Renaissance philosophers.

Ramon Llull

Even in a Renaissance perspective, an account of concord cannot fail to mention Ramon Llull's notion of such an ideal and its link to peace, as Llull's ideas always remained linked to the question of how the three monotheistic religions could peacefully coexist or, more precisely, how they could unite into one true religion. In his 1309 *Liber de acquisitione Terrae Sanctae*, Llull argues that such a unified religion, which could only be Christianity, is not possible because of the divisions between the different Orthodox churches and the Roman Church. Llull's plan for a unified church is, ultimately, a tripartite one. First, he advocates the founding of monasteries, where future missionaries can acquire the necessary linguistic skills and knowledge. Second, he is convinced that one single knightly order (like the Templars) would be sufficient to reconquer the Holy Land. Third, he envisions military intervention, which, for the sake of peace, may vary according to context. Llull, aware as he was of the counter-factuality of his ideas, used to call himself a fool or a *vir phantasticus*.

Nicholas of Cusa

Nicholas of Cusa's formulas of learned ignorance (*docta ignorantia*) and coincidence of opposites (*coincidentia oppositorum*) testify to his foundational method of dialectics that elevates apparent contrarities to a transcendent understanding.

Cusa – a pivotal figure in philosophy and theology as well as in the history of the Christian Church – was exposed to, and active in, various contentions of his time: the ecclesiological battle of the Council of Basel, negotiations with leaders of the Byzantine and Roman Churches, his contested government of the Brixen diocese, and his response to the Fall of Constantinople to the Turks in 1453. On that occasion, Cusa wrote his *De pace fidei*, one of the major works of philosophy of toleration, arguing that, while faith as a truth claim is controversial, the aim of faith (that is, salvation and union with God) is unifying. Religious strife therefore mirrors the tension between the perceptive plurality of created objects and the oneness of creation in the light of the Creator. Accordingly, Cusa's search for concord has its philosophical foundation in the speculative idea of oneness that regulates all possible understanding.

Giovanni Pico Della Mirandola

Giovanni Pico della Mirandola deals with concord (*concordia*) by way of unity and peace (*pax philosophica*, as he calls it) in a number of his works, and most notably in his so-called *Oratio de hominis dignitate* (1486), in the *Conclusiones nongentae* (1486), in the *Heptaplus* (1489), and in the *De ente et uno* (1490–1491). While in his speculative works Pico della Mirandola tackles in philosophical and theological perspective how to achieve an agreement among discording parties and avoid the fragmentation and armed feuds (when not wars) that the lack of a resolution for such theoretical and practical conflicts had been causing and would continue to cause if not addressed urgently, his need for political action is witnessed by the proclaimed intention to organize what he defines as a council (*concilium*) to be held in 1487 in Rome in order to debate the *Conclusiones nongentae*, after having introduced them by reading the *Oratio*. While the planned council could not take place – ultimately for the opposition of Pope Innocent VIII and of the commission, which he had appointed to verify the orthodoxy of the *Conclusiones* – Pico della

Mirandola's commitment to the achievement of peace lives on in his attempt to show in his works the unity of truth that can only be understood with an in-depth study of every philosophical and religious tradition followed by an active attempt at reconciling their differences.

Desiderius Erasmus

Desiderius Erasmus defended religious concord throughout his theological dispute with Martin Luther and most explicitly in his *De sarcienda ecclesiae concordia* (1533). His two great political and religious ideals are pacifism and church unity, and they are also his two most scorching failures. Virtually inseparable in his writings, they are defined, respectively, as *pax* and *concordia*. Erasmus promoted concord reducing the number of fundamental articles of faith to a minimum, in order to avoid doctrinal disputes and conserve religious unity. His ideal of concord endured long after it ceased to be viable and can be seen at work in the colloquies and polemics that preceded the French Wars of Religion.

Joan Lluís Vives

Joan Lluís Vives made a significant contribution to the discourse of concord in the early sixteenth century and left a legacy widely disseminated in the early modern period. In his *De Europae dissidiis et bello Turcico* (1526), and the treatise *De concordia et discordia in humano genere* (1529), Vives explicitly structures his arguments around the categories of concord and discord. *De Europae dissidiis* examines the origins of European religious and philosophical dissension and dynastic war and suggests remedies such as church councils, effective diplomacy, and defensive alliances between Christian powers. *De concordia et discordia* extends these arguments, such that concord and discord encompass all levels of human life, from the individual to the family, city, church, and secular and ecclesiastical rulers.

Confessio Augustana

Federico Barbierato

University of Verona, Verona, Italy

Abstract

Written by Philip Melanchthon for the Augsburg Diet of 1530, the Confession was presented by five princes and two cities in order to illustrate the changes introduced in their territories following the Lutheran inspiration. Melanchthon took up and reformulated previous professions of faith trying, on the one hand, to quell the internal fractures to the Protestant movement and, on the other, to show a continuity with the Catholic theological and institutional tradition. In those years in fact, deep rifts had emerged inside the reformed front, and discussions attempting to overcome them had multiplied. Background political events – primarily the prospect of a weak Christian front facing the Turkish threat – made essential an attempt to take a unified position on many controversial issues. The articles of Schwabach and Thurgau, together with those derived from the Colloquium of Marburg, formed the

starting points for Melanchthon who, instructed by Luther himself, was in charge of bringing order to the theological and ecclesiological situation. An uneasy situation also within the reformed formation, which among other things, witnessed the controversy about the real presence – according to the Lutheran interpretation – or symbolic, in the Zwinglian, the body and blood of Christ in the Eucharist. While acknowledging the reported abuses, Rome refused any form of solution that went against its own tradition, considering it a guarantee of universal agreement as founded on Peter's mandate and the apostolic heritage.

History and Original Aspects

Written by Philip Melanchthon for the Augsburg Diet of 1530, the Confession was presented by five princes and two cities in order to illustrate the changes introduced in their territories following the Lutheran inspiration. Melanchthon took up and reformulated previous professions of faith trying, on the one hand, to quell the internal fractures to the Protestant movement and, on the other, to show a continuity with the Catholic theological and institutional tradition. In those years in fact, deep rifts had emerged inside the reformed front, and discussions attempting to overcome them had multiplied. Background political events – primarily the prospect of a weak Christian front facing the Turkish threat – made essential an attempt to take a unified position on many controversial issues. The articles of Schwabach and Thurgau, together with those derived from the Colloquium of Marburg, formed the starting points for Melanchthon who, instructed by Luther himself, was in charge of bringing order to the theological and ecclesiological situation. An uneasy situation also within the reformed formation, which among other things, witnessed the controversy

about the real presence – according to the Lutheran interpretation – or symbolic, in the Zwinglian, the body and blood of Christ in the Eucharist.

Formally, the Confession was composed of 28 articles, the first 21 devoted to matters of faith, the remaining ones to “abuses” they intended to remedy. The starting point was the Lutheran anthropology: due to the original sin, humans have become weak and cannot achieve salvation through their own efforts but only through the sacrifice of Christ, which has reconciled them with God. This sacrifice is reflected in Eucharist, in which His body and blood are to be considered truly present in the bread and wine. The sacrifice is the basis of the reconciliation, and therefore the preaching of Old and New Testament aims precisely to strengthen the faith in the sacrifice, because it is in the knowledge of the Scriptures that the human possibility of acting properly rests. Being naturally sinful, man can neither remember nor comprehend all the sins he commits and therefore is not able to refer them to the priest. How should therefore man behave? The traditional devotions – related to relics, saints, fasts, etc. – can be functional to edification, but they are not mandatory: those who do not carry them out do not commit a sin, precisely because of their symbolic dimension. Works in fact do not lead to salvation: in contrast, faith leads to good works; nor is the intercession of the saints useful to salvation: they are to be considered examples to follow. In fact, everybody is called, according to different forms of “vocation,” to follow God and can do it in different ways. There are no different degrees of vocation: priests, nuns, husbands, wives, and so on will be evaluated for the purity of their intent and not for their outward acts, characterized by freedom of choice. In human affairs indeed man has free will because he has been endowed with reason and therefore can choose, a possibility he is not guaranteed in the realm of the Spirit. Listed among the “abuses remedied” in articles 22 to 28 are the innovations of communion under both species, the marriage of priests, confession, the elimination of sins related to food and ecclesiastical power, which

was limited to preaching and the administration of sacraments.

The articles were characterized by a degree of caution also toward the Church of Rome: Melancthon constantly recalled the coherence of the proposal with the formulations of the Fathers, of the primitive Church, and of course with the Biblical text.

While acknowledging the reported abuses, Rome refused any form of solution that went against its own tradition, considering it a guarantee of universal agreement as founded on Peter's mandate and the apostolic heritage. These issues, connected to a strong sense of the importance of religious experience and material religiosity, formed elements of friction and split, as well as the concept of "good works" and their role for salvation. However, the limits of papal and episcopal power were above all the issue that stiffened Roman positions: there were too many overlaps between the spiritual mandate to care for souls and the temporal sphere. In particular, in the spirit of the Confession, it was primarily the position of the German bishops that was to be revised, to limit their interference in the civil and political life at the expense of pastoral care. Rome's choice was rejection and took the form of a papal Confutatio, to which Melancthon responded with an Apology of the Confession. The Roman attitude led Lutheran representatives to abandon the Diet and to form in 1531 the Schmalkaldic League, so that the Augsburg Confession was recognized as legitimate only in the Diet of Augsburg of 1555 and confirmed in the Peace of Westphalia.

Conimbrans

► [Conimbricense, Collegium](#)

Conimbricense, Collegium

Cristóvão S. Marinheiro
Réserve Précieuse, Bibliothèque nationale de
Luxembourg, Luxembourg, Luxembourg

Abstract

The time frame covered by this article goes from 1548 to 1606, i.e., the year of the foundation of the *Collegium Artium* by King John III of Portugal (1502–1557) to the year the last commentary on Aristotle was published. The main focus is given to the period from 1555 onward, when the college was entrusted to the Jesuits. A detailed study on the pedagogical discussions leading to the Jesuit *Ratio Studiorum* and the link to the *Cursus Conimbricensis* on the main works of Aristotle is then disclosed. The structure of the commentaries combining the Aristotelian text, a prose comment and up-to-date *quaestiones* on philosophical issues, creating thus a hermeneutic

circle, a *Corpus Aristotelicum Interpretumque*, is explained, as well as the development it led to. Although the Jesuits chose to edit these commentaries as a group of authors, they could partly be identified. Finally, the legacy of these commentaries on the main European philosophical traditions up to the twentieth century is summarized.

Synonyms

Colégio das Artes (Collegium Artium); *Commentarii Collegii Conimbricensis e Societate Iesu in [opera] Aristotelis Stagiritae*; Conimbrans; Conimbricenses; Jesuit Aristotelianism of Coimbra; Jesuit Commentaries of Coimbra on Aristotle; Colégio Real in Coimbra

Introduction

The term *Collegium Conimbricense* refers in the first place to the *College of Arts* (Collegium Artium) founded by King John III of Portugal (D. João III) (June 7, 1502–June 11, 1557) at Coimbra City (Portugal) in 1548 in order to prepare young men in Latin and philosophy for their eventual admission to university studies. In the beginning of the seventeenth century, however, this College became famous for the commentaries on Aristotle that were produced there by the Jesuits, who had taken charge of the college in 1555. Actually, the term *Collegium Conimbricense* was a recurrent feature in the titles given to these commentaries, which were issued between 1592 and 1606 (*Commentarii Collegii Conimbricensis Societatis Iesu in ... libros ... Aristotelis Stagiritae*) and quickly worked as a “brand” (Casalini 2012, p. 11) for unrivaled Catholic Counter-Reformation textbooks on Aristotle. The strategy of choosing a brand name for a collection, unheard of in those days, had such an impact on the history of philosophy that this college has ever since been remembered as the very school which produced these commentaries, thus leading to an identification between *Collegium* and *Cursus*. In a narrower sense, the expression

Collegium Conimbricense usually refers to the *Cursus Conimbricensis*, viz., the following eight commentaries on Aristotle:

- Collegium Conimbricense. 1592. *Commentarii Collegii Conimbricensis Societatis Iesu in octo libros physicorum Aristotelis Stagiritae*. Coimbra. António Mariz
- Collegium Conimbricense. 1593a. *Commentarii Collegii Conimbricensis Societatis Iesu in quattuor libros de coelo Aristotelis Stagiritae*. Lisbon. Simão Lopes
- Collegium Conimbricense. 1593b. *Commentarii Collegii Conimbricensis Societatis Iesu in libros meteorum Aristotelis Stagiritae*. Lisbon. Simão Lopes
- Collegium Conimbricense. 1593c. *Commentarii Collegii Conimbricensis Societatis Iesu in libros Aristotelis, qui parva naturalia appellantur*. Lisbon. Simão Lopes
- Collegium Conimbricense. 1593d. *In libros ethicorum Aristotelis ad Nicomachum, aliquot Conimbricensis cursus disputationes in quibus praecipua quaedam ethicae disciplinae capita continentur*. Lisbon. Simão Lopes
- Collegium Conimbricense. 1597. *Commentarii Collegii Conimbricensis Societatis Iesu, in duos libros de generatione et corruptione Aristotelis Stagiritae*. Coimbra. António Mariz
- Collegium Conimbricense. 1598. *Commentarii Collegii Conimbricensis Societatis Iesu, in tres libros de anima Aristotelis Stagiritae*. Coimbra. António Mariz
- Collegium Conimbricense. 1606. *Commentarii Collegii Conimbricensis Societatis Iesu, in universam Dialecticam Aristotelis*. Coimbra. Didaco Gomes Loureiro (The works of Pedro da Fonseca, the commentary on Aristotle’s *Rhetoric* by Cipriano Suarez, and the *Grammar* of Manuel Alvares (1523–1586) could also to a certain extent be considered as works belonging to this school, since they were the first results of the pedagogical thoughts that would lead up to the editorial work; see below. The works by Francisco Suárez (January 5, 1548–September 25, 1617), written after these commentaries

had been published, can be considered as the finest developments these comments led to. The commentaries on the *Nicomachen Ethics* and the one on the *Parva naturalia* do not use the text of Aristotle, but only consist of *quaestiones*).

These comments are intimately linked to the Jesuit *Ratio Studiorum* and can be considered to be its first tangible result. Moreover, they were also consciously written with a political scope in mind: to strengthen the Catholic faith within Europe (against the Reform movements) and to spread it all over the world. The close link to the Portuguese maritime expansion is evidenced by the fact that these commentaries were translated into Chinese in the first half of the seventeenth century, constituting thus the first expression of Western philosophy translated into an oriental language (Zhang 1999, pp. 364–379; de Carvalho 2010, p. 16).

In 1759 the Jesuits were dispossessed of their College, which was integrated into the University in 1772 through the Pombaline University Reforms.

In 1836, the College was finally closed, having as its successor the *Liceu Nacional de Coimbra*.

Heritage and Rupture with the Tradition

By the mid-sixteenth century, preparing students for university admission in philosophy meant providing them with a solid basis in Latin, rhetoric, and Aristotelian philosophy. Instead of sending pupils abroad, as was usual in his time, King John III chose to found the *Collegium Artium* at Coimbra, where the University was already based. The first Principal chosen was the humanist André de Gouveia (1497–June 9, 1548), who had been Principal of the *Collège de Guyenne* at Bordeaux (France). His uncle, Diogo de Gouveia the Elder (1471–December 8, 1557), had been Principal to the College of Sainte Barbe, a college initially intended to prepare young Portuguese pupils for university and which became best known as the school where Ignacio de Loyola (May 31, 1491–July 31, 1556) studied theology. When André was

appointed Principal to the C. C. in 1548, some teachers of his crew came with him to Coimbra, among them the Portuguese Diogo de Teive (1514–1569), João da Costa, the French Nicolas Grouchy (1510–1572), and the Scot George Buchanan (1506–September 28, 1582). Very quickly the rivalries between Diogo de Gouveia the Younger (†April 2, 1576) (the nephew his homonym uncle would have preferred as Principal in Coimbra) and André provoked a quarrel involving the recently founded Inquisition, as the teachers coming from Bordeaux were alleged to have sympathized with the Reform. The teachers from Bordeaux were accused of heterodoxy by the ones brought in from Paris (Brandão 1948–1969, pp. 1–107; Pereira 1989 10,430 sq.). This led the King to entrusting the responsibility of the college to the recently founded Order of the Jesuits in 1555.

When considering the many translations Nicolas de Grouchy, who taught Greek and philosophy, left behind, it is clear that Aristotelian philosophy was already represented in the college. When the Jesuits took over the college, however, the question of how to read Aristotle in order to tighten the knots of the Catholic faith was the main problem they were faced with. Hence, the question about how to comment on that author was their most pressing.

Innovative and Original Aspects

Idea and Development of the Commentary

Humanism brought major innovations into the Aristotelian tradition inherited from the Middle Ages (Kessler 2008, pp. 139–142; Copenhaver and Schmitt, 1992, pp. 65–76; Schmitt 1992, pp. 31–34). Although the Latin Aristotle continued to be studied at European universities, the renewed philological interest compelled more and more readers to go back to the Greek sources. The first edition of the Greek Aristotle, the Aldine edition, published in Venice at the end of the fifteenth century, gave rise to various Latin translations as well as to editions of most of the ancient commentators on Aristotle. By the end of the 1530s, all texts of Aristotle and his ancient commentators were available in print, be it in Latin or

in Greek (Grafton 1988, pp. 767–791). Most of the Aristotelian texts went through various translations into Latin, thus weaving ever new interpretative threads throughout Europe (Schmitt 1992, 13). This is the reason why Schmitt chose to speak about the Aristotelianisms of the Renaissance, preferring the plural to indicate these different interpretative threads). Hence, when the Jesuits took over the C. C. in 1555, they were confronted with a variety of Aristotelian and anti-Aristotelian interpretative lines to be refuted in order to comply with Catholic Aristotelianism. Moreover, the European maritime expansion made it urgent to have trustworthy textbooks in order to school not only Europeans but also Asians (Zhang 1999, pp. 364–379) and, to a lesser extent, natives of South America, mainly Brazil.

The Rise of the Textbooks

The choice made by the Conimbricenses to publish their textbooks as the works of a group of authors instead of signing them individually is certainly unique for that time and needs to be explained, since it is highly relevant for understanding their strategy.

The idea of assembling textbooks was first suggested in a letter written February 9, 1560, by Father Torres, *praepositus* of the Portuguese Province, to Jeronimo Nadal (1507–April 2, 1580), Father General of the Order. He recorded that two lecturers (*lectores*) of the Arts had given some dictations accurate enough to be published, one of them having been on rhetoric (cf. *De arte rhetorica libri tres ex Aristotele, Cicerone et Quintiliano deprompti* published by Cipriano Suarez that very same year in Coimbra). This, Torres suggested, would benefit teachers as well as students and lecturers: both would have more spare time in order to concentrate on the important topics; the former to write and read their lectures, the latter to write them down and to assimilate them. (The letter can be found in Lukács 1974a, II 59–64. Cf. also Lukács 1974b, III 317: “Uno de los lectores de artes ha hecho buena parte de unos ditados en ellas con diligencia para poderse imprimir; y otro hizo otros en la retórica. [...] Nos an escrito que haríamos un gran beneficio a esta tierra, si imprimiésemos estos ditados de las

artes. Y en la verdad ansi lo creemos. Por lo menos sería gran alivio y descanso ora los nuestros que leen, y para los que oyen; porque los unos gastan mucho tiempo y estudio en hazer los ditados y escribirlos, y después en ditarlos en la cátedra a los oyentes; y los otros en recibirlos; y aviéndolos impresos, quedavan todos con más tiempo libre y descanso.”) In 1561, Jeronimo Nadal visited Portugal and asked some of the professors of this country, and first of all Pedro da Fonseca (1528–November 4, 1599), to write a course on philosophy (Lukács 1974b, III 317; cf. also Rodrigues 1931–1938, II.2 103), since the lack of one such course was perceived even by the professors of the Roman College (*Collegium Romanum*). (Although this lack will only be explicitly expressed 2 years later, see Lukács 1974a, II 317.)

Nadal’s instructions of 1561 already set the course for the disposition of the commentaries:

1. At the beginning of the cursus, when reading the introduction, read carefully what concerns the Prior Analytics, the Perihermeneias and the Sophistici elenchi, so that this may serve the students for the whole cursus and help them pass more easily through the books. [...] 3. Aristotle should be read in such a way that many parts he treated diffusely [difusamente] and that are not important for the science be read in summary [compendium], indicating only their substance without reading the text [letra], so that there is more time left for reading the Metaphysics and the De generatione and the De anima and the Parva naturalia and especially the Metaphysics, since this is the most profitable for scholastic theology. (Lukács 1974b, III 59: “1. Al principio del curso, quando se lee la introducción, se lea con diligencia lo que toca à Prioras, Perihermeneias y Elenchos, para que se ayuden dello los estudiantes por todo el curso, y después passen más facilmente por los libros. [...] 3. Aristóteles se lea de manera, que muchas partes que él trató difusamente, y no son de importancia para la sciencia, se lean en compendio, diziéndosse la substancia solamente dellas, sin se leer la letra, para que quede más tiempo para leer *Metaphysica* y *De generatione* y *De anima* y *Parvos Naturales*, y especialmente la *Metaphysica*, que es lo que más aprovecha para la theologia scholástica.”)

In the same year, the *Masters of Coimbra* answered Nadal’s proposition by listing the exact passages that should be read in detail, those only to be commented on by a scholium (*glosa*), as well as the ones to be summarized (*en*

summa) (Lukács, 1974b III 66 sqq.: “Porphyrio todo, *Predicamentos* todos, *De interpretatione* todos los libros, excepto el último cap° del 2° libro con *summa*. *Prior*es: los 7 capítulos del primero, 8° 9° 10 11 con *summa*, el 12 letra con glosa, 13 14 15 con *summa* breve, 16 hasta donde dize “hoc autem monstrato”, letra y glosa; de lo demás del mismo cap° *summa* breve hasta el cap° 21, *summas* brevísimas, y assí hasta el 29, y en este 29, *summa* extensa sin letra, en lo que queda del libro, ni *summa* ni letra. En el 2° libro hasta el cap° 18 exclusive, dexar lo de todo, dando una *summa* breve. Las 6 potestades de los *sylogismos*; el 18 se lea el principio, donde pone los modos *petitionis principii*. Lo que se sigue, se dexe todo, sin *summa*; si no el 23 y 24 y 27 con *summas*. *Posterior*es : 8 capítulos primeros con glosa y letra, y assí el 10 11 23 24 26; en todos los demás se dé, en cada uno *summa*; en el 2° libro, primero cap° y ultimo con glosa y letra; los demás con *summa*. De *Tópicos* los diez capítulos primeros con letra y glosa; en los demás capítulos *summa*. El 4° y 6° libro, con letra y sin glosa, colligiendo solamente, en cada libro, un argumento breve de cada uno. *Elenchos* : los 4 capítulos, con letra y glosa; y el 5°, con *summa* sin letra; y el último capítulo de los *Elenchos*, la letra solamente. El primero de los *Physicos*, todo con letra y glosa. El 2° libro, todo con letra y glosa, excepto el cuarto cap° en que se dará *summa*. En el 3° libro, los 3 capítulos primeros con letra y glosa; y los demás capítulos, hasta el fin, en cada uno, una buena *summa* que ponga las razones en forma, excepto el 7° capítulo que se leerá con letra y glosa. El 4° lib., el 10° cap° por *summa*, sin letra; y de la misma manera el 6° y el 9°. Los demás capítulos, con letra y glosa. El 5°, todo con letra y glosa, excepto el último cap° en que se dé *summa*. Del 6° libro, primero y 2° capítulos, con letra y glosa. En los demás capítulos, *summas* buenas que declaren bien la sustancia de Aristóteles con tratar las cuestiones ordinarias. El 7° libro se leerá todo, con letra y glosa, excepto el 4° cap°, en que se dará *summa*. En el 8°, todo con letra y glosa, excepto el 2° cap° en que se dará una buena *summa*. El primero *De Coelo* en el cap° 5 6° y 7°, con *summas* y letras; los demás con letra y glosa. Del 2° libro, los

primeros 8° capítulos y el 10 y 11, con letra y glosa. El 9° y los demás, con *summa*. El último cap° con letra y glosa. El 3° libro se dexe todo, dando un argumento breve dél. En el 4° libro se dexe el 2° cap°, con un breve argumento; los demás capítulos, con letra y glosas. Los *De generatione*, en el primero libro, se dexe la letra del 2° y 8° y 9°, dando *summas*; lo demás con letra y glosa. Del 2° libro, se dexa el 6° y 9°, con *summa* breve. Lo demás, con letra y glosa. Los *De anima* del primero libro, se leerá el primero cap°, con letra y glosa; lo demás se dexará, dando un argumento de todo. El 2° y 3° libro, todo con letra y glosa.” Lukács, 1974b, III 67).

On January 14, 1562, Fonseca was ready to provide Nadal with an outline of the course. He proposed to choose “two or three serious interpreters of Aristotle” without naming them, in order “to point out the doubts and the good explanations, clarifying the passages by one another” (Lukács 1974b, III 319: “Assimismo me parecía que yo fuesse en este tiempo viendo todos los libros de Aristóteles que no tengo vistos y pueden servir (o no tam vistos) apuntando las dudas y buenas exposiciones con dos o tres graves interpretes como cifras, exponiendo unos lugares por otros, etc”). He thus suggested to create a hermeneutic circle, a *Corpus Aristotelicum Interpretumque* that would work like a closed reference system within these texts only, allowing the obscure passages to be explained by clearer ones. But Fonseca was aware of the fact that the texts retained did not give an answer to all the problems Aristotle had pointed out, nor did they explain the whole tradition the Conimbrans lived in. Hence, he proposed that Cipriano [Suárez] should focus primarily on the mathematical problems raised by Aristotle, for example, those pertaining to geometry and demonstrations. In addition to this, he added that one should also cover the passages dealing with cosmography, astrology, and perspective (the latter being a pet subject of the Jesuits) that can be found in *De Coelo* and the *Meteors*. On top of all this, the theory of the planets, as presented in the fourth chapter of Johannes de Sacrobosco’s *Sphaera*, should also be included, since this work was already being lectured on in Coimbra. Finally,

one should include those passages in Pliny and in some others that could be used for explaining the *Meteors*, such as those dealing with the winds or the sources of rivers (Lukács 1974b, III 319: “[Y] que el P. Cypriano attendiese especialmente a las cosas de matemáticas que ay en Aristóteles, como son exemplos de geometría, demonstraciones, lugares que hablan de lo que pertenece a cosmographía, astrología y perspectiva, como ay muchos en los libros de coelo y metéoros; y allende desto hiziesse por traer algo de las theóricas de los planetas al 4º cap. de la sphaera de Sacrobosco que acá se lee, quanto buenamente se pudiesse hazer, y se compadeciesse con el tiempo que se daa a estas cosas. Finalmente que leyesses en Plinio y otros algunos lo que puede servir para materia de metéoros, como de vientos, de origine fontium, etc.”). Neither must the works of Cicero be omitted, for they taught one how to write and argue (modos de hablar y tratar) (Lukács 1974b, III 319). Marcos Jorge (1524–1571) (Sommervogel 1869–1876, col. 821) was singled out to deal with some questions relating to Scotist philosophy and others that he considered important with a view to pointing out their difficulties and their resolutions. The same held for the *Natural Questions* of Seneca and for Alexander of Aphrodisias, as well as for some other ancient authorities that would serve the point. (Lukács 1974b, III 319: “[Y] que el P. Marcos Jorge podría ver algunas questiones (que sabe seren altercadas en el curso) por Scoto y otros que le pareciesse, apuntando brevemente lo que ay de dificultad o de resolución, y leyesses las questiones naturales de Séneca, Alexandro Aphrodisio, et de alguno otro antiguo que hiziesse al caso.” To the third quoted in this letter, P. Pero Gómez, there is no specific task mentioned. Cf. Lukács 1974b, III 318.)

This letter is interesting on many counts, the most significant one perhaps being the authors and works that it does *not* mention. Fonseca establishes a plan for his fellow teachers by providing them with a precisely defined framework. A handful of canonical authors, both from Antiquity and the Middle Ages, are named, among them Alexander, Cicero, Seneca, Pliny, Scotus, and John of Holywood. But only two works are

explicitly referred to – the *Natural Questions* and *The Sphere of the Universe*. The staff is left with only a moderate degree of independence to add *some other authors* related to the questions and authors already listed. Nonetheless Fonseca does not specify whether these authors should be contemporaries, or classical, or both, leaving the choice open. Another striking point is the absence of Thomas Aquinas. António M. Martins argues that the Doctor Angelicus was implicitly present in this outline without there being any need to mention him explicitly. This problem will be indirectly addressed by Ariew (1998), when he tries to prove that the Conimbrans were Scotists, not Thomists, as the French historian of philosophy Etienne Gilson had already maintained.

When we consider the Aristotelian works to be commented on, we notice that they follow the medieval canon, leaving aside the *Mechanics* and the various biological writings that were being rediscovered in Northern Italy (e.g., by Ulisse Aldrovandi [September 11, 1522–May 4, 1605]). The works retained in order to comment on Aristotelian problems could also hardly be considered as up to date, mirroring as they did a medieval tradition. Nonetheless, this all-in-one strategy of presenting the Aristotelian text – a prose commentary followed by questions in the tradition of medieval treatises, both together creating a *Corpus Aristotelicum Interpretumque* – was the major pedagogical innovation in textbooks at the time. These encyclopedia Aristotelian treatises became best and long sellers in their time, when we consider the many reeditions issued all over Europe. (The most striking difference to be noted is the use of the Greek Aristotle in several reeditions, whereas the Portuguese *editiones principes* only use Latin. The question of the translations used is not yet resolved. A census of these foreign editions was first established by A. A. de Andrade (Góis 1957), which is more recently revised by Mário Santiago de Carvalho and is available from the site <http://www.saavedrafajardo.org/Archivos/Conimbricenses_Bibliografia.pdf>. This census is not meant to be exhaustive.) Not only were students and teachers spared the labor of dictating and writing down the lessons, but they were also

provided a complete textbook that could be used as a reference work.

The Authors Chosen to Comment on Aristotle

Fonseca thought that, by joining forces, this common task could be accomplished within the span of 2 or 3 years' time, as it was split up among a group and everyone would work on it on a daily basis in order to complete it. After this preliminary work, the gathering of the manuscripts and the revisions for editing could then be done by one single person (Lukács 1974b, III 319: "Creo que a cabo de dos o tres annos, si esto procede deste modo y los otros maestros y theólogos ayudan en lo que tengo dicho, estaraa la materia tan dispuesta, que se haga mui en breve el curso todo, y con ocupación de quasi no más que una persona"). Although this is not stated in the sources known to us, it is plausible to assume that Fonseca wanted the whole course to be ready for 1565, the year in which the College of Arts was integrated into the University of Coimbra. At that time, the new statutes that would also affect the didactical disposition of the courses were probably already being prepared. The 3-year course approved in 1552 by the College of Arts (the College of Arts existed since 1548, but the leadership was only given over to the Jesuits in 1555 by King João III) was extended to a 4-year course (the eight semesters of the course were organized according to the works of Aristotle in the following way: first and second semester, dialectics; third semester, *Physics*; fourth semester, *Ethics*; fifth semester, *Metaphysics*; sixth semester, *Parva Naturalia*; seventh semester, *De anima*; eighth semester, review and preparation for the degree).

When we consider the time frame set by Fonseca and the publication years (i.e., 1592–1606), we understand that his fellow Jesuits did not meet the deadline aimed for. The only work published during that time slot was Fonseca's own *Institutionum Dialecticarum Libri Octo* of 1564. Even his *Commentarii in libros Metaphysicorum Aristotelis* were only published during the next two decades, when he spent his time in Rome. After having promised these commentaries in the first edition of his *Institutionum Dialecticarum Libri*

Octo (Fonseca 1964, p. 10: "[U]t ego, quod in profitenda Philosophia aliquot annos posuissem, qua possem brevitate, et perspicuitate eos libros Aristotelem exponerem, qui auditoribus Philosophiae explicari consueverunt"), Fonseca explained in the "Preface" in the second edition of 1574 the reasons that had kept him from his work and the choice finally to publish his commentary on *Metaphysics*:

Concerning the remaining commentaries on Philosophy I promised to write in the first edition, there is no reason for anyone to accuse me of having published none of them until now. But no sooner had I concluded the interpretation of Porphyry's *Isagoge* and on Aristotle's *Categories* that I was compelled for quite some years to deal with things which left me with no spare time to write. But finally delivered, I decided to comment first of all the books of the *Metaphysics* and even to publish them. (Fonseca 1964, 10 sqq.: "Quod verro attinet ad reliquos Philosophiae commentarios, quos in prima editione, me conscripturum pollicitus sum, non est quod me quisquam iure accuset, quod nihil hactenus ediderim. Vix enim absoluta explicatione Porphyrianæ Isagoges, categoriarumque Aristotelis eas res non paucis annis obire coactus sum, quæ nihil otii ad scribendum permittebant. Mihi vero tandem aliquando redditus, in eam sententiam sum adductus, ut ante omnia, constituerim libros primæ philosophiæ enarrare, atque adeo in publicum emittere." Cf. also Rodrigues 1931–1938, II 2 109 sqq.)

The first commentary finally to be edited displaying a common position of the Coimbra Jesuits under the title *Commentarii Collegii Conimbricensis Societatis Iesu* ... would only be issued in 1592 in Coimbra. This delay was certainly related to Fonseca's appointment in Rome as Assistant to the Father General in 1572 (Martins A. M. "Pedro da Fonseca"; in *Logos*, II, 657; Rodrigues 1931–1938, II 2 105 sqq.). But this was not the only reason.

Fonseca had turned his attention to the *Metaphysics*, as he said in the second edition of his *Dialectics*, but he had not imagined that this work was destined to become his *opus magnum*. Although the first volume was published in 1577 and the others were ready by 1579, he only saw the second volume published in 1589, the others being issued after his death in 1606 and in 1612, respectively.

As early as 1575, however, the first critiques of Fonseca's accuracy were raised by the Provincial Manuel Rodrigues (1549–1612) (cf. in Sommervogel 1869–1876, col. 1940). The detailed treatment suggested, so Rodrigues said, would need too much study time and was not suited for school reading (Rodrigues 1931–1938, II 2 110). The best solution therefore would be to print the manuscript commentaries already in use at Coimbra, since one needed succinct and summary explanations (Rodrigues 1931–1938, II 2 110). The commentaries written by Fonseca would be of use to scholars, not to students.

In 1579, the same request was sent anew to Rome with the following arguments: the students were still forced to write down the course, and their teachers to dictate it. More important than this however was the evidence that this course was not only useful but even necessary to finally achieve the desired consistency on philosophical issues within the Company (Rodrigues 1931–1938, II 2 111: “Por fim com êsse Curso se alcançaria finalmente a tão desejada uniformidade nas opiniões entre os Padres da Companhia. Por estas razões se persuadia a Congregação que era não só útil, mas necessária a publicação do Curso de Artes”). One year later the Provincial for the Portuguese Province came from Rome with the publishing order. A new chief editor had to be sought for this task. Luis de Molina (1536–1600) (Sommervogel, 1869–1876, col. 1167 sqq.) seemed to position himself as the right man for this. It seems however that his difficult and litigious character led the company, and first of all Fonseca, to reject him as the general editor. (The only evidence we have are the letters by Molina addressed to Claudio Aquaviva in Rome, published in Stegmüller 1935, 548 sqq. In the introduction to this work, Stegmüller also evinces his character traits on pp. 78 sqq. A more crucial issue, though one we cannot deal with in this article, is the fact that Molina was a Spaniard in the midst of Portuguese colleagues. He himself refers to this in a letter to Aquaviva from August 29, 1582: “[...] propongo lo que en ella se contiene, no dexaré para más luz de advertir a V. P. la aversion, que en muchos, etiam superiores, e sentido, y el poco favor que an dado para que

luzgan y se impriman mis cosas, parece que por extranjero; y aunque no uviera de ser tenido por tal, pues a veinte y nueve años que estoy y me crié entre ellos” (Stegmüller 1935, p. 558). In other letters he points out the malevolence of Fonseca in the latter's dealings with him. This may be relevant as the letter was written exactly 2 years after Philippe II of Spain had reclaimed the Portuguese crown, since Philippe II of Spain was the uncle of the heirless king D. Sebastião (1554–1578). (This political change led to the messianic movement known as *Sebastianism* in the Portuguese culture. We do not know how the Jesuits positioned themselves in this movement, since it was a company founded by a Spaniard and coming from the neighboring country. Moreover, the Jesuits were firmly established in the political power since 1542, and the Spanish Queen D. Catarina (1507–1578), sister of Carlos V of Spain (1500–1558), always knew how to unite the policy of these two countries against part of the parliament (Cortes) (cf. Cruz 2009)). The dedication of Fonseca's *Metaphysics* to King D. Sebastião in 1577 may denote some nationalistic feelings. Yet we would overinterpret it if we considered this a *Sebastie* dedication. We do not follow Rodrigues 1931, II, 2, 114, here, who contends that Molina was a “too easily suspicious, demanding and difficult [...] character with his pretensions.” This too seems to us a nationalistic argument of the early twentieth century.)

It was finally Manuel de Góis (1543–February 13, 1597) who was appointed to the task, as he was considered to be a good philosopher writing good Latin. Moreover he was well prepared by a continuous teaching experience covering two complete courses (i.e., 8 years), which he had taught at the College from 1574 to 1582. In 1584 the commentary on the *Physics* was almost ready, since the Father General in Rome was asked whether this commentary should be printed in Portugal or not (Lukács 1992, p. 302; Rodrigues 1931–1938 II 1 115). Around that time, the commentary on the *De Coelo* likewise seemed to be ready, and in October 1585, Góis was working on the commentary on the *De Generatione et Corruptione*. Although Góis wanted these to be already sent to the printer's, the Father General

Aquaviva (1542–1615) (Sommervogel 1869–1876, col. 480 sqq.) suggested to wait until the whole course was completed. The insistency of Góis and of the whole Portuguese Province finally prompted Aquaviva to send his *imprimatur* to Coimbra. The first volume of the Coimbra commentaries was then sent to the press in March 28, 1592 (Rodrigues 1931–1938, II 1 116).

Nonetheless, Góis cannot fully be considered to be the author of these commentaries. As stipulated by Fonseca since the very beginning of the enterprise, the chief editor had to collect the manuscripts used in the lectures and arrange them for publication. Evidence of this is given us in a letter written by Molina to the Praepositus Claudio Aquaviva in 1582 (Stegmüller 1935, pp. 548–557). He complains that his course in the Arts, which had to be printed, was still being used in Coimbra but in an unacceptable way: “A great part was taken from the *glosas* I had put together, cutting many things out and retaining opinions that are shown by experience to be quite hard to understand. And these *glosas* do not deal with the topics as coherently as should be done” (Stegmüller 1935, p. 550: “[...] que en gran parte fueron sacadas de las que yo hize, cortando muchas cosas, y metiendo opiniones que se experimentaron asaz duras. Y hallaronse aquellas glosas no tener las cosas coherentes como convenia”).

We have no clue as to why the treatise *De Anima* separate and the passage from the *Problems on the five senses*, included in the commentary on the *De Anima*, were written by Cosme de Magalhães (1551–1624) or by Baltasar Álvares (Stegmüller 1959, p. 96; 461; de Carvahlo 2010, p. 11) (de Carvahlo (2010, p. 11) believes in an “editorial collaboration” by Cosme de Magalhães, as the commentary on the *De Anima* was issued after Góis’ death in 1597).

The commentary on Logic was finally issued in 1606, when the Coimbra Jesuits came to know that a commentary using the title *Commentarii Collegii Conimbricensis Societatis Iesu...* had been published in Frankfurt in 1604. This *logica furtiva* forced them to assert their position on logic; it was Sebastião do Couto who was entrusted with this task. (Despite many conjectures advanced to this

day, the printing history remains unclear. Rodrigues asserts that this Frankfurt edition recycles a text by a former teacher of his that he used to dictate to his students. One of them would have sold it to the editor, who in turn would have used the title as a marketing strategy. Cf. Rodrigues 1931–1938, II 1, 119.)

In the end, no commentary on the *Metaphysics* would ever be printed. Rodrigues says that, in 1592, Fonseca was asked to complete a commentary on logic and metaphysics, although the Jesuits from Coimbra could see that Fonseca was a bad choice if they wanted to have it done quickly. In 1606 a letter exchange between Rome and Coimbra suggests Sebastião do Couto as the editor of these commentaries. As we know, only one of them would ever appear in print (Rodrigues 1931–1938, II 1 118).

The time these commentaries took until their first appearance in print and the way in which they were composed clearly show us the problems the Jesuits of Coimbra were facing. The first one is obvious to anyone who has ever worked in a university department: managing the different characters and ambitions of faculty members. The second one is less obvious but philosophically relevant: the positions held in the commentaries had to be in accordance with the positions of the group in general. Moreover, the hierarchical structures obliged them to develop a *via media* on Aristotle, thereby eschewing the actual problems the Aristotelian text led to. Actually, the Jesuits not only had to respect the ideological positions of their time, they also had to respect the decisions of the Councils and of the See of Rome. Striking examples for these commitments are the questions on *Natural history* about the torrid zone and the antipods (Marinheiro 2012, pp. 395–424), as well as the question about the eternity of the world, which had to respect the Paris condemnations of 1277 by Etienne Tempier and the challenges of the Copernican Revolution.

One must not lose sight of the fact that by that time, the positions Peter Ramus (1515–1572) had developed in his *Aristotelicae animadversiones* of 1543 got more and more appreciated, although they were leading away from Aristotle. In this perspective, the Jesuits of Coimbra are the last

philosophers trying to save Aristotle from his critics in Catholic countries. The way they chose to do this was the most arduous: rejecting any position on Aristotle that was irreconcilable with their *Corpus Aristotelis Interpretumque*, whatever period it was from.

Impact and Legacy

Textbooks are hardly intended to be innovative, their scope being to disclose and vulgarize the information already known to the specialists. Nonetheless, the Conimbran commentaries presented certain aspects that were innovative and would have a certain impact on the authors of the following centuries.

The main innovation was of course the didactical presentation of the textbooks and the greater importance given to the development of the *quaestiones*. The availability of these comments in print would allow other authors to address the philosophical topics present in the *quaestiones* directly and in a systematic manner, leaving aside the narrowly philological sentence by sentence commentary and the explanation about how Aristotle would have considered the issue. (The best example can be found in Francisco Suárez's *Disputationes Metaphysicae*, also a teacher at Coimbra. Since the comment on *Metaphysics* by Fonseca was already available in print, he could focus on the different topics and *dispute* them.)

Hence, the major innovation of these textbooks lies in their capacity to bring together all the positions known in the Aristotelian tradition on the different topics, including recent discussions and controversies. Even if they mostly prefer not to name names, classifying them as schools (e.g., the *Averroists* in psychology) or referring to them as “more recent authors” (*recentiores*) [cf. Marinheiro, 2012], the latter's positions are considered, discussed, and in many cases also refuted. Hence, the commentators' positions on many issues force them to remain up to date and to acknowledge the existence of other authors.

Early modern philosophy will lead away from Latin to vernacular languages; philosophers are

no longer university teachers but gentlemen (e.g., Bacon, Descartes, Spinoza, Vico) founding new philosophical systems that will be known as rationalism and empiricism. Nonetheless, the commentaries continued to be read in schools and universities (their importance cannot be overestimated when one considers the reeditions published all over Europe), giving an Aristotelian hue to modern philosophy (Descartes' reference to them in a letter dated September 30, 1640, to M. Mersenne can be considered as the most striking example). It will be in Germany that this legacy will be most palpable. The followers of Luther had to call upon Aristotle in order to put the reformed theology on a solid philosophical ground, using for this purpose the most up-to-date textbooks, even if they had been written by their confessional enemies (Lewalter 1935). The Jesuit commentaries will thus bequeath upon modern philosophy antique and medieval concepts and problems, which Christian Wolff (1679–1754) would translate into German, thus creating the background of the German tradition (de Carvalho 2001). (The concepts of *tempus et spatium imaginarium* found in Kant's *Dissertation* of 1776, leading up to the *Transcendental Aesthetics* in the *Critique of Pure Reason*, could be found in Christian Wolff's *Physics*, concepts which were passed on from the medieval tradition through the Jesuit commentary on *Physics*. See de Carvahlo 2001).

Modern history of philosophy has shown a certain difficulty in getting to grips with this school and the textbooks that came out of it. In metaphysical issues, the most recurrent name in nineteenth- and twentieth-century German philosophy is that of Francisco Suárez (de Carvahlo 2010, p. 16), as the highest representative of the tradition in which the commentaries had their roots. Suárez is mostly referred to as the head of the school of what they called the “Spanische Barockscholastik” (Spanish Baroque Scholasticism). (This antiquated denomination, which is still in use, is absolutely unfit to describe the school: the term Baroque is taken from art history; the term Scholasticism refers to the medieval Thomistic heritage. The term Spanish may fit if we consider it in its wider and antique sense, as a

synecdoche to describe the Iberian Peninsula.) The Italian and Spanish historiographies use the term *Seconda Scolastica* (Second Scholasticism), thus evidencing the clear medieval Thomistic heritage.

A renewed interest in the commentaries has arisen through the semiotics as developed by Charles S. Peirce (September 10, 1839–April 19, 1914), whose notion of *sign* (signum) goes back to Sebastião do Couto's comment on *Logic* (*The Conimbricenses* 2001).

Connan, François

Born: 1508

Died: 1 September 1551

Xavier Prévost

Faculté de droit et science politique, Université de Bordeaux, Pessac, Cedex, France

Abstract

François Connan, French jurist of the sixteenth century, is one of the greatest representatives of the legal humanism. His only book, called *Commentarii juris civilis libri X*, applies a systematic method, which criticizes both the structure of the *Corpus juris civilis* and the work of the medieval jurisconsults.

Alternate Names

[Franciscus Connanus](#)

Biography

François Connan was a French jurist of the sixteenth century, born in 1508 and died in 1551 in Paris. During his studies, he has been the pupil of two great figures of the Renaissance. First, he studied at the *Collège du Cardinal-Lemoine* in Paris, where Raoul Spifame taught him Aristotelian philosophy. Second, he followed the lectures of Andrea Alciato in Bourges around 1529. The Milanese was then laying the foundation of legal humanism in France. Moreover, Connan was also influenced by Jean Calvin, who was his friend during their legal studies in Orléans and Bourges. Connan became a lawyer at the Parliament of

Paris, before being appointed *maître des comptes* by Francis I in 1539. The following year, he was promoted *maître des requêtes de l'Hôtel*. His career allowed him to further expand his circle of humanist friends: statesmen, such as Michel de l'Hospital and Christophe de Thou, but also the poets of *La Pléiade*. The unique and unfinished book of Connan is then published by another of his humanist friends, Louis Le Roy, who made printed the *Commentarii juris civilis libri X* in 1553, two years after Connan's death (Connan 1553).

Because of the new method used by its author, this book is certainly one of the most important works of the legal humanism. Indeed, Connan appears as one of the first representatives of the systematist current of legal humanism, which was influenced by Cicero and his famous expression *jus ad artem redigere* (Bergfeld 1968). According to Connan and all the systematist jurists of the sixteenth century, the classical Roman law formed a coherent and rational system, unlike the compilations of the Byzantine Empire. Thus, they aim to expound the law in a logical order according to a deductive approach, going from general to specific. They have not rediscovered the ancient Roman law – which was not systematic – but their works have deeply transformed the European legal orders of the modern times. The *Commentarii juris civilis libri X* have taken part in this major break with the previous jurisprudence.

Connan criticizes both the structure of the *Corpus juris civilis* and the work of the medieval jurisconsults. Like all the humanists, he rejects the scholastic method of the Commentators. Contrary to the Bartolists, he tries to come back to the sources. But, in Connan's view, the sources are also distorted and the Justinian's compilations are incoherent. So, in order to find the true sense of the Roman rules, he deconstructs the *Corpus juris civilis* and reassembles it according to a rational method (Piano Mortari 1966). Thus, the *Commentarii juris civilis libri X* are built on the framework of the *Institutes* of Justinian. In fact, only this book of the Justinian's compilations is deemed coherent by Connan. Consequently, the French humanist begins his commentaries with

the sources and the legal history (book I). Then, he resumes the tripartite division of the *Institutes*: persons (book II), things (books III and IV), and actions (books V to X). Connan develops all his commentaries from Roman law, by gathering together the texts scattered in the *Corpus juris civilis*. Besides, he mentions some French customs.

After Connan, numerous jurists have used the division of the *Institutes* in order to build their own commentaries. So, even if they are still unrecognized, the *Commentarii juris civilis libri X* represent an important break in the history of legal thought; and Connan's work has had a real legacy. His original method has given rise to a prolific movement. Especially thanks to Hugues Doneau, the systematist current of legal humanism has had a big influence on Grotius and the school of natural law.

Conscience, Renaissance Understanding of

Rudolf Schuessler

University of Bayreuth, Bayreuth, Germany

Abstract

Unlike the scholastic tradition, the Renaissance as a cultural phenomenon did not produce a distinctive cluster of theories of conscience. Renaissance authors, scholarly as well as literary ones, largely used and modified the medieval and scholastic models of conscience in very diverse ways. However, within the temporal range of the Renaissance (1300–1650), the scholastic discourse of conscience underwent momentous changes and Protestantism developed its own discourse of conscience. The present article does not canvas these developments, beyond shortly elucidating the medieval background of Renaissance dealings with matters of conscience, but focuses on the cultural impact of the Renaissance, and specifically Renaissance humanism. In this respect, four vectors of influence are addressed: humanist rhetoric, with its criticism of scholastic uses of opinions and preoccupation with virtue; Renaissance individualism, born of the claims of a new class of intellectuals (i.e., humanist) to moral competence (but not of an alleged “invention of the individual”); Machiavellian and reason-of-state political thought; and a fledgling moral relativism nourished by a first age of globalization.

Introduction

The catch-word “Renaissance conscience” suggests some unity in the subject matter to which it refers (on the Renaissance conscience in general, see Leites 1988; Stone 2009; Braun and Vallance 2011). However, it does not require a deep dive into the history of the concept of conscience to question this assumption. Most observable unity in theory and use of the concept of conscience in

the period usually associated with the Renaissance (c. 1300–1650) seems to derive from currents of thought not specifically characteristic of the Renaissance as a cultural phenomenon. Christian and especially scholastic understandings of conscience, which had become highly elaborate and differentiated since the twelfth century, formed the main building blocks used by Renaissance men and women in formulating their own very diverse views on conscience. In due course, we will therefore have to look at this shared premise of Renaissance dealings with conscience. The Reformation altered the Christian discourse on conscience decisively and, for instance, largely shaped the discourse of conscience in Renaissance England (e.g., by producing a pronounced English Protestant moral casuistry [see Wood 1952; Stone 2000; Andrew 2016; Germann and Decock 2017; Iacono Lobo 2017] or influencing literature [see Slights 1981; Wilks 1990; Gallagher 1991; Tilmouth 2011; Stoll 2017]). Yet the main driving force of these developments was the Reformation, not the Renaissance. The idea of a Renaissance conscience is also often associated with “heroes” of conscience, such as Luther, Erasmus, and Thomas More (Hein 2000; Cummings 2011; Suzanne 2014). The latter two are quintessential northern Renaissance men, so that Luther’s placement in this triad suggests a Renaissance element in his heroism of conscience (“Here I stand, I can do no other”). This view naturally fits the classical Burckhardtian narrative of the Renaissance as a period of nascent individualism, strong willed personalities, and consciousness of one’s own dignity as a human being (Burckhardt 2004). Upon closer inspection, however, heroism of conscience is too unspecific of the Renaissance to form a building block in the present context. There were strong-willed heroes of conscience before the Renaissance or unaffiliated with it (Thomas Becket, Catherine of Siena, Jan Hus, and others), and a great number of Renaissance rulers (highlighted with relish by Burckhardt) had apparently no conscience at all. Individualism seems a better indicator of the direction in which the Renaissance altered the Christian discourse of conscience. Although the lack of individualism in

the Middle Ages is often vastly overstated, there is a point in depicting the medieval care for consciences as a collective endeavor (Biller 1998; Firey 2008). Renaissance humanist and Protestant views both fostered a significantly more individualistic approach to conscience. Yet this is not the only major change attributable to the Renaissance. We should (and will) also account for Renaissance amorality, as embodied in Machiavellism or “reason of state” theories as a transforming power for the discourse of conscience in politics. Finally, the rise of relativistic views of morality in the Renaissance should be addressed. It was fed by the European global encounter with cultures whose moral norms differed more starkly from its own than the moralities of the long familiar fellow “book religions” of Judaism and Islam. Renaissance authors such as Montaigne excelled in discussing relativistic views, which are therefore a fitting subject here.

It is thus possible to identify some notable influences the Renaissance as a cultural phenomenon (broadly conceived) exerted on the European discourse of conscience from the fourteenth to the seventeenth centuries. However, it would be wrong to assume that the respective vectors of influence characterized the Renaissance exclusively. The global expansion of European trade and power was not specifically a Renaissance affair. Hardnosed power politics was not alien to medieval rulers, and scholastic preachers had a penchant for rhetoric, too. The most we should claim is that Renaissance contributions in the abovementioned three fields stand out as particularly incisive, but not as exclusive. Yet before we come to that, the considerable background of medieval dealings with conscience needs to be elucidated at least in rough outline.

Heritage: The Medieval Conscience

The concept of conscience as a human ability or disposition to individually judge moral issues, and in particular to distinguish between right and wrong conduct, did exist in some form already in classical antiquity (Kirk 1936; Sorabji 2014; Giubilini 2016). It acquired an increasingly

important role in late antique Christian thought and was fleshed out in minute detail in the Middle Ages (Potts 1980; Langston 2015). Although conscience could therefore have been a topic for the Renaissance's trademark return to classical ancient thought, this was apparently no major concern of Renaissance humanists. They continued to use or adapt medieval notions of conscience in their writings (see Greene 1991; Weber 2010; Stoll 2012 for the case of 'syn-deresis'). Starting in the twelfth century, scholastic thinkers (for simplicity's sake here identified with medieval academics who reasoned in a university style steeped in logic) had systematized and added to the ideas on conscience of the ancient Fathers of the Church, such as Augustine. In the Aristotelian-scholastic tradition, the workings of conscience were largely conceived in a logico-deductive mode, starting with very general moral premises, into which human right reason had insight independently of historical or cultural differences between human beings. These general premises (like the Golden Rule 'Do unto others as you would have others do unto you') were also the foundation of what was called natural law. More specific premises, which usually required some empirical knowledge often varied case by case. They were required to derive practical guidance from the principles of right moral reason, and humans could both err and be uncertain with respect to these minor premises, and thus also with respect to the moral conclusion. On a theoretical level, the various respective models of conscience of scholastic authors were buttressed by elaborate psychological, epistemological, and metaphysical considerations. On a practical level, they became the backbone of a vast scholastic system of moral theology (and practical ethics), in which confessors could variously fill the roles of judges, advocates of penitents, or therapists (Jonsen and Toulmin 1988; Schuessler 2014a). Transgression of the dense, but not inflexible medieval regulations of moral conduct and right use of conscience could be harshly punished, not only but not least by the Inquisition.

It is important to note that the regulation of consciences, mainly through case-wise (i.e., casuistic) analysis of permitted, sin-free, and

prohibited, sinful conduct, was neither monolithic nor unchanging in medieval and scholastic thought. A plurality of approaches co-existed, and especially in the period often associated with the Renaissance, important developments in the scholastic applied discourse of conscience occurred. In fact, the widespread view of decline and inertness of scholastic thought in these centuries is totally misleading with respect to the applied discourse of conscience. Scholastic analyses of conscience became ever deeper and more detailed in this period. They gave rise to massive treatises on conscience (*de conscientia*) for which nothing comparable in scope and depth exists in Renaissance thought. Specific ideas about conscience and its workings in Renaissance authors are often adapted in simplified form from this background. Marsilio Ficino's views on conscience, for instance, are largely "scholasticism light" (Hein 2000, p. 141).

Scholastic casuistry, on the other hand, was also influenced by the Renaissance. The dynamism of the Florentine Renaissance economy under the Medici, for instance, notably influenced which economic transactions the scholastic moral theologian Antonino of Florence considered licit in conscience (Peterson 1985). This was an indirect influence of the Renaissance but not a direct one of Renaissance humanism. Therefore, the question remains whether Renaissance humanism also directly impacted the discourse of conscience.

Innovative and Original Aspects

The Impact of Renaissance Humanism

Humanism and scholastic thought did not evolve independently of each other (Rummel 1995; Mazzocco 2006). More than a few scholastic authors were open to humanist styles and interests, and it is plausible to assume that some of these cross-over tendencies affected the discourse of conscience. The problem, however, is to ascertain vectors of influence. One of the most important possible vectors concerns the "currency" of the medieval guidance of consciences: the reputable or plausible opinion (*opinio probabilis*, see

Kantola 1994; Franklin 2001; Schuessler 2003, 2014b). Applying the Aristotelian concept of *endoxon* – i.e., a reputable or plausible opinion held by all, most, or the most competent users (Top. 100b20) – Renaissance humanist authors like Lorenzo Valla or Rudolph Agricola did not wholly abandon the Aristotelian approach via reputability but put emphasis on the coherence of a reasoning process as legitimizing ground for the adoption of opinions (Mack 2011; Spranzi-Zuber 2011; Schuessler 2014b). When the scholastic moral theological understanding of *opinio probabilis* changed at the end of the sixteenth century to a twin-pillar model based on reason or authority, it therefore seems natural to look for humanist influences behind this move. In fact, it has been claimed that the Jesuit penchant for Ciceronian rhetoric motivated them to spearhead changes in the scholastic discourse of conscience (Maryks 2008). If this were the case, Renaissance humanism would have had a momentous impact on Catholic moral theology.

It is, however, difficult to prove such a strong influence. The respective modifications of the “currency” of moral guidance might have arisen from different causes. Not only humanists but also scholastics avidly read ancient authors like Quintilian and the rediscovered texts by Cicero, and might themselves have developed a modified understanding of *opinio probabilis* in response. The Renaissance rediscovery of ancient texts rather than a direct influence of Renaissance humanism would then be the relevant vector of transformation. Moreover, reasons were already important for the choice between reputable opinions in medieval regulations for moral conduct, not least in medieval jurisprudence (Evans 2002), which operated with a wider range of understandings of reputability than moral theology. To sum up, further research concerning the influences of Renaissance humanism on the scholastic discourse of conscience is required before a confident conclusion in this respect is warranted.

Renaissance individualism is a safer bet with respect to a key transformative influence on the discourse of conscience. It does not require the old and dubious claim that “the individual” was re-discovered in the Renaissance to

make this claim. Scholasticism was distinctly “expertocratic” in its approach to moral judgment. Trained moral theologians and canon lawyers were the scholastic model evaluators of applied moral matters. All others (except the pope, who in any case usually was a lawyer or theologian) were called upon to follow the guidance of these moral experts. The rise of well-educated humanists as a social group challenged this moral expertocracy. Virtuous and well-educated laypersons increasingly began to claim moral competence and thus in the long run to undermine the scholastic system of moral guidance. Whereas individual experts could exert a remarkable influence in the scholastic system, the virtuous individual in general now began to assert his or her moral self-reliance. Women profited from this trend because they were barred from the university training that defined scholastic moral professionalism. They had long been acknowledged as possible moral exemplars but lacked authority in their intellectual assessments of moral issues (For the female conscience, see Daybell 2011; for their denigration as ‘simple little women’ [*mulierculae*], Weber 1999; and for the ‘women question’ in the Renaissance in general Ross 2009).

Yet, not only Renaissance individualism but also a humanist penchant for virtue (Lines and Ebbersmeyer 2013) shifted the balance between deontic regulation and virtue ethics in the guidance of consciences. In the scholastic tradition, moral guidance in the confessional was largely conducted in a jurisprudential manner based on permissions or prohibitions (i.e., deontic norms). Of course, exhortation to virtue did play some role in the confessional as well as generally in Christian ethics, and above all in preaching (Murray 1998). Yet it is difficult to assess how much impact the preaching of virtue had on pre-modern merchants or rulers to whom a profitable course of action was outlined in the confessional (or by theological advisors, whom the client paid) as permissible but less virtuous than an alternative. In any case, whatever impact the discourse of virtue had on medieval and Renaissance agents, humanist preoccupation with virtue ethics contributed in the long run to a shift in the balance between deontic regulation and virtue orientation.

It remains to be asked, however, how much of this shift occurred in the period presently under discussion and how much of it had to wait until the Enlightenment era.

Machiavellism and “Reason of State”

One of the most conspicuous developments in Renaissance thought with respect to matters of conscience is their absence in Machiavelli’s account of prudent political action (Cox 2010). Machiavelli hardly ever appeals to the concept of conscience when he addresses issues of morality. It is clear, of course, that in his eyes medieval Christian practical ethics was not an appropriate yardstick for judging the performance of a prudent and successful head of state. Moreover, if Burckhardt’s ruthless Renaissance princes (Burckhardt 2004, part I) are taken as role models for political action, the conscience of successful Renaissance rulers was already Machiavellian *avant la lettre*. Post-Machiavellian theorists of reason of state, who developed approaches to realistic power politics under early modern conditions for avowedly Christian princes (Viroli 1991; Anglo 2005; Braun 2011), did not return to the old norms of Christian practical ethics as embodied in thirteenth- or fourteenth-century treatises on moral theology. Whether in issues of just warfare, taxation, choice of counselors, economic policy, or other matters, they transformed norms of Christian practical morality in ways sensitive to considerations of reason of state (i.e., to concerns of power, security, reputation, and wealth of states or republics). They could not have done so if scholastic practical ethics had not been flexible to a certain extent from the outset. Many scholastic moral theologians were willing to adapt norms to the exigencies and possibilities of the real world. As indicated above, a change of gear occurred in this respect in the fifteenth century, above all with respect to economic issues. Whether this generally mirrors the new opportunities and realities of “a Renaissance era” or was just a response to Europe-wide developments in late medieval societies is bound to be controversial. In any case, with respect to reason of state, Christian morality seems to have responded to Renaissance thought in the sixteenth

and seventeenth centuries. The inbuilt flexibility and lawyerly spirit of scholastic practical ethics facilitated the mitigated acceptance of reason of state with respect to the regulation of princely consciences. Mitigated considerations of reason of state were increasingly flagged up at least as “probable opinions” and thus as *prima facie* morally acceptable (Reinhardt 2016). Counter-opinions, which advocated moral restraint, were often also acceptable or even advisable, but not prescribed, and this was the crucial point for a hardnosed legalistic practical ethics that condoned every action as permissible which did not cross the red line of actions explicitly prohibited by the Church. Renaissance reason-of-state thinking thus transformed Christian political ethics by systematically working hand-in-hand with scholastic doctrines for the guidance of consciences. In this way, the Renaissance conscience of political agents remained within the bandwidth of moral theological legitimacy, which it in turn helped to broaden.

Early Modern Relativism

The increasing globalization of European cultural encounters in the fifteenth and sixteenth centuries brought Europeans into contact with more exotic moral views than ever before. Conquerors, missionaries, merchants, and travel writers did not hesitate to dwell on shocking differences in morality between “them” and “us” (Schiffman 1991). Renaissance intellectuals were fascinated by reports of alien customs and sometimes turned them into reflections on moral relativity. The most famous such reflection is perhaps Montaigne’s essay on cannibals (Montaigne 1993, Essay 31; Conley 2005). It uses the interplay between the cannibals’ “otherness” and similarities to us as occasion to question presumed certainties in European and Christian morality. In this way, moral relativism seems to serve as a handmaiden to an increasingly skeptical morality taking hold of Renaissance consciences. Apart from the relativism aspect, however, uncertainty was not extraordinary for Christian consciences. Medieval theologians had developed elaborate doctrines for reaching safety of conscience despite the uncertain truth of moral opinions (opinions, in

contrast to knowledge or *scientia*, were by definition uncertain according to scholastic terminology; see Franklin 2001, Schuessler 2014b). The usually limited skepticism of the Renaissance (Popkin 2003) did therefore not appear shocking to most Christian moralists. Relativism, in the sense of a true culture-bound morality, was a different issue, because it was incompatible with the purported universalism of Christian moral beliefs. Renaissance authors thus paved the way for natural law's loss of acceptance in the eighteenth century. Yet the career of moral relativism in modernity is a complex issue, bundling a hodgepodge of disparate influences. The transformation wrought on Renaissance consciences by new cultural encounters was just one of them, albeit an important one.

Contagion, Renaissance Idea of

Concetta Pennuto

Centre d’Études Supérieures de la Renaissance (UMR 7323), Université François-Rabelais, Tours, France

Abstract

This article focuses on the notion of contagion from Antiquity to the sixteenth century. Hippocratic and Galenic medicine left an important medical legacy to medieval and early modern physicians. During the Middle Ages, the plague was explained on the basis of the Galenic theory of contagious disease, which was enriched by the belief of the stars and God. During the Renaissance, Girolamo Fracastoro started to have doubts about Galenic theory and tried to innovate it through his own experience and medical knowledge. He changed the way one considers an infected patient and pushed physicians away from making the patient feel guilty for their ills. Fracastoro’s theory of contagion was debated during the sixteenth and following centuries.

Synonyms

Epidemics; Plague

Heritage and Rupture with Tradition

The concept of contagion is time-old, and it can be found in medical sources dating as far back as Antiquity. In fact, ancient medical and literary texts testify to the spread of contagious diseases, labeled as epidemics and plagues. The historian, Thucydides (c.460–c.400 B.C.), and the poet, Lucretius (first century B.C.), speak of the plague of Athens, which probably was epidemic typhus (Thucydides 1967; Lucretius 1924). Galen (second century) observed the so-called “Antoninus plague” (Boudon 2001; Sabbatini and Fiorino

2009), and Procopius of Caesarea (sixth century) the plague of Justinian (Procopius 1962). Many epidemics can be noted in Europe during the Middle Ages, the most significant being the Black Death, 1346–1351. The Black Death is the first epidemic of a pandemic, which lingered over Europe until 1722 (Biraben 1975). As recent medical literature has shown, the pandemic, which ravaged Europe between the fourteenth and eighteenth centuries, is “the main historical event responsible for the introduction and widespread dissemination of the ancestor to all currently circulating *Y. pestis* strains pathogenic to humans”: *Yersinia pestis*’ spread was conditioned by such factors as environment, vector dynamics, and host susceptibility (Bos et al. 2011: 506). Climate fluctuations also contributed to the spread of *pestis* from the fourteenth to eighteenth centuries at least (Schmid et al. 2015).

Ancient and medieval medical literature tried to explain contagion by medical knowledge of the time, namely, Hippocratic and Galenic humoral medicine. In fact, health and disease were explained through the harmonic balance of the four fluids of the body, called humors: blood, yellow bile, black bile, and phlegm. This balance was a very individual one and it changed according to the relation between the person and the environment. As such, a given population may enjoy a particular humoral balance depending on geography and climate; inside a population, an individual had a specific balance, according to the place, the water, the air, the diet, the practice of gymnastic, sleeping, sex, emotions, and so on. Therefore, disease was an individual event; every one reacted differently to the disease and fell ill differently.

In this context, plague was a very upsetting disease, since during an epidemic almost the entire population became ill and died everywhere and in a very narrow lapse of time. How can this phenomenon be explained? The way the disease spreads means it must be able to reach many countries and stay there for a certain period of time: this means it is the air which is affected by a level of qualitative change, namely, pollution, and becomes miasmatic. According to Hippocratic medicine (Jouanna 2001), miasmatic air reaches every breathing being.

Observing plague, Galen questioned the origins of the miasmas of the air and decided that no buried corpses, exhalations from basins and marshes, heat waves, and so forth, caused them. All these factors created very small seeds in the air: the pestilential seeds (*loimou spermata*), which in turn formed miasma. These seeds of the air introduced the disease to the patient through breathing (Galen 1821: 289–291). Nevertheless a problem remained in medicine: if everyone breathes the same pestilential air, why during a plague do some people survive and not die as others? This was a major problem according to Galen, since the entire system of humoral Hippocratic medicine was put at stake by this very question. The Hippocratic explanation of the spreading of plague no longer worked.

Thus, Galen had to find a reason why some people could survive during a plague, whereas the majority died. He found the answer to the question in diet and in the lifestyle of patients. If a person lives well, that is, if he eats and drinks according to a balanced diet, breathes good air, practices moderate exercise in alternation with rest, sleeps enough, and dominates passions, he in turn can enjoy good health when a plague breaks out (Galen 1821: 291–292). All the elements just mentioned are part of the Galenic hygiene and were named “6 non-natural things” in medieval medicine (Nicoud 2007).

As such, Galen’s good patient does not die during epidemics; he can survive. Galen left substantial medical heritage to the medieval and early modern physicians, and his theory of contagion and miasmatic air was somewhat influential. During the outbreaks of *pestis* in the Middle Ages and the Renaissance, physicians published a number of treatises in order to educate people on how to keep well through diet and lifestyle, like medical textbooks, *regimina*, *régimes*, antidotarium, and so on.

Innovative and Original Aspects

Galen innovated Hippocratic tradition by his questioning about the origins of the disease and the way it spreads and captured public attention. During the Middle Ages, physicians explained the

Black Death and the other outbreaks of the disease accordingly to the Galenic theory: people fell ill breathing miasmatic air. Contagion was explained by the contact of individuals with the infected air. Air could be polluted by the Galenic causes (corpses, swamps, and so on), but also by God's wrath. According to Laurent Joubert, professor of medicine at the University of Montpellier, the first cause of plague was the divine justice, since God punishes human beings because of their sins (Joubert 1581, 14). According to François Valleriole, professor of medicine at the University of Turin, the plague is the club by which God castigates mankind (Valleriole 1566, 22–23) (Fig. 1).

As regards the plague, philosophers and physicians explained that God could send it by means of the stars or from heaven. Indeed, the stars changed the quality of the air. The physicians of the Faculty of Medicine in Paris were asked by the king of France to explain the causes and the nature of the Black Death. The remote cause was found in the conjunction of the three superior planets (Saturn, Mars, and Jupiter) which took place the 20th of March 1345, at 1 p.m., as well as in the numerous eclipses, which characterized that period: all these phenomena corrupted the breathed air (*Compendium* 1888 [1348], 77–79). Nevertheless, astrological causality became the center of animated polemics during the fifteenth

Contagion, Renaissance Idea of, Fig. 1 Culmacher Philippus, *Regimen wider die pestilenz*, Leipzig, M. Landsberg, ca. 1495 (Wellcome Library@London)

and sixteenth centuries. Some physicians, like Giovanni Mainardi, did not believe in its impact, whereas others continued to search for the cause of contagious disease, also venereal disease, like syphilis, in the alignment of the planets (Zambelli 1965).

Divine causality and the stars are to be considered as a way to enrich ancient causality. Nevertheless, medieval physicians did not change the Galenic epistemological issue of the outbreak and the spread of epidemics, that is, to say that they still considered miasma as the means of infecting people and lifestyle remained at the bottom of the reasons why people can survive during a plague. As already mentioned, a huge number of treatises on diet were published during epidemics, since one must avoid contagion by a body not predisposed to catch the contagious disease.

Nonetheless, a change in the study of causality can be observed in the middle of the sixteenth century. In 1546, Girolamo Fracastoro (1478 ca. – 1553) (Fig. 2) published in Venice (Giunti) *De sympathia et antipathia rerum liber unus. De*

contagione, contagiosis morbis et curatione libris tres (Fracastoro 1546). This was the second major publication of Fracastoro on the topic of contagion, since he had already published the poem *Syphilis sive morbus Gallicus* in 1530 (Fracastoro 1530). Fracastoro was also an astronomer, a poet, and a philosopher. The search for the cause of natural phenomena and the way they worked out were the major questions of his medical thinking.

According to Fracastoro, contagion must be explained as the transmission of illness from one person to another, as well as from one part of a body to another part of the same body. To trigger contagion, contact between two bodies is required and/or their separate parts (Fracastoro 1930 [1546], 2). Fracastoro asks how contagion starts. In order to have contagion, one must have putrefaction in the first body or part of the body. The existence of putrefaction of the first body can be due to many reasons, like meteorological influences of the climate (Fracastoro 1930 [1546], 8). What is of great interest for him is the way putrefaction operates in the body. In fact, bodies are composed of very little and imperceptible particles and putrefaction makes them release. The body thaws, while its released particles overflow from it and create bigger aggregates called *seminaria*: the seeds of contagion (Fracastoro 1930 [1546], 8–10).

Fracastoro's choice to use *seminarium*, seed, is quite important. He could use *semen*, which is the common Latin translation of the Greek and Galenic *sperma* (seed). But he preferred to change the name of the carriers of the disease into *seminarium*. In order to germinate, a *semen* (seed) needs to find a soil, which has been prepared to receive the plant. A *seminarium* is a nursery, a hotbed, the place where trees grove up (Estienne 1536, 8). It is more than a seed, which generates a plant: it is also tinder, namely, a seed, which can propagate its content, as described in 1536 by a Ciceronian lexicon (Nizolio 1536, 1599).

Actually, Fracastoro innovated Galen's idea of contagion through lexical choice and the context in which he placed the *seminarium*. In fact, there still was a point in Galenic theory, which did not fit with Fracastorian thought and experience of

Contagion, Renaissance Idea of, Fig. 2 Girolamo Fracastoro, *Opera omnia*, Venetiis, apud Iuntas, 1574 (Wellcome Library@London)

contagious disease: the notion of hygiene in relationship with the lifestyle of the patient. Galen got wrong, according to Fracastoro, since experience shows that well-being persons catch the seeds (*seminaria*) of disease as well as not well-being persons. There are persons whose health is very good. Nonetheless, they get ill. If a person is already ill and suffers from imbalance of humors or plethora, she/he can of course easily catch the disease. But it is a coincidence; a nonhealthy person, a person who drinks wine or does not make physical exercise can be free from the contagious disease: “we see that countless persons who are perfectly healthy and whose humors have suffered no depravity, nevertheless catch that contagion from merely associating with the plague-stricken, or from his clothes. [...] the humors in some individual may be in a normal condition, obstruction and plethora may be entirely lacking, and yet the plague may be contracted from another person” (Fracastoro 1930 [1546], 80–82).

As a matter of fact, the Galenic explanation according to which the patient could not only act on health, but also determine his physical being in order to catch the plague was no longer valid for Fracastoro. According to him, the patient is not responsible for falling ill with the plague or a contagious disease. Falling ill is no more a question of lifestyle; it is a question of analogy, namely “sympathy” (*sympathia*) and “antipathy” (*antipathia*), with the agent of contagion. The aptitude of the matter (*materiae aptitudo*) of the body determines analogy, whereas according to Galen one should speak of aptitude of the patient (*patientis aptitudo* – *tou paschontos epitedeiotes*) because of lifestyle, (Fracastoro 2008 [1546], 74–76; Fracastoro 1930 [1546], 83–85). As Fracastoro said, “Not that there is any reason why the above-named conditions [*sc.* plethora, obstruction] may not sometimes be present in addition, but they are an accidental addition to the principle (primary agent) that acts per se [...] In fact it may happen that, in an individual, either the phlegm or the bile is predisposed to putrefy [...], but that they nevertheless are not infected by the contagion so much as some other

humor is infected, because the analogy with them is lacking” (Fracastoro 1930 [1546], 83–85). So, the *seminaria* find a body with which they have antipathy: “antipathy to the natural heat of the body, and to the soul itself” (Fracastoro 1930 [1546], 85).

In the case of a pestilent fever, for instance, the seeds, *seminaria* have quite a strong power of adhering to the humor with which they have analogy; they are very active and moist. Moreover, because of their antipathy with the natural heat of the body of the patient, “the humor, deprived of this heat, quickly contracts deep-seated putrefaction” (Fracastoro 1930 [1546], 85). This putrefaction broadens to all the parts of the body and generates other *seminaria*, which increase here and there, as if they produce progeny (*soboles*). *Seminaria* produce contagion, since they go inside a second body and affect it with the same disease, and then a third is affected, and so on. One can speak of contagion only when there are *seminaria* which spread the disease from one body to another (Fracastoro 1930 [1546], 85–87).

The spread of a contagious disease can happen through three ways of transmission: direct contact only; the same with the addition of tinder (*fomes*), like clothes, wooden objects, which could preserve the seeds of contagion: one can find this type of contagion in the case of scabies, phthisis, bald spots, elephantiasis; and the contagion that infects by contact, by tinder and at distance in the case of pestilent fevers, phthisis again, certain kinds of ophthalmia and exanthemata, like variolae (Fracastoro 1930 [1546], 7). A case of contagion by direct contact is rabies, where the direct contact is represented only by the bite of a dog, which tears the skin and may draw blood (Fracastoro 1930 [1546], 125).

Impact and Legacy

Galenic medicine explained contagion through the seeds of the air, namely, the miasmatic air. People fall ill with plague because the body is already corrupted by bad diet and bad lifestyle. In the sixteenth century, Fracastoro tried to

innovate Galenic medicine through experience and clinical observation: falling ill was no more a question of lifestyle, even if a bad diet could influence the way a body reacts in the case of contagion. In the following centuries, the Galenic theory of contagion was still spread, but Fracastoro started to show that physicians could make use of their own experience in order to understand the way contagious diseases spread and act varyingly on different patients. In his treatise on contagion (Fracastoro 1930 [1546]), he studied many contagious diseases, like syphilis (Fracastoro 1530), measles, plague, rabies, and so on. Every disease is particular and must be differentiated from one another. Diseases act differently on the human body depending on the natural constitution of individuals.

Fracastoro's book was frequently reprinted in the following centuries. As Vivian Nutton pointed out (Nutton 1990), during the sixteenth-century Fracastoro's theory of contagion raised many reactions in favor and against *seminaria*, especially in the event of the epidemics of the 1550s and 1570s. During the seventeenth and eighteenth centuries, the notion of seeds and progeny developed, thanks not only to observations through the microscope, but also to the philosophical debates on the notion of progeny (Wilkinson 1984).

Abstract

Gasparo Contarini was an Italian philosopher, ambassador, and cardinal. His wide range of interests covered metaphysics, elementary physics, but also political history and biblical exegesis. He was an important philosophical interlocutor of Pietro Pomponazzi, Girolamo Fracastoro, and Juan Sepulveda. As ambassador of Venice, he traveled to Germany and Spain. Here he soon became close friend with the Emperor Charles V and often engaged him in conversations about their common naturalistic interests. Finally, he was appointed cardinal while he still was a layman. He was personally involved in the reform of the Church, of the administrative offices, and of the role of the bishops. He was also probably the last strong advocate of a reconciliation between Lutherans and Catholics. With this aim he presided over the failed Diet of Regensburg, in 1541.

Biography

Gasparo Contarini was born in Venice on October 18, 1483, from Alvise Contarini and Polissena Malipiero (on his life, see Dittrich 1881, 1885; Ross 1972; Fragnito 1978, 1983; Cavazzana Romanelli 1988; Fragnito 1988; Gleason 1993; De Doncker-Nejeschleba-Robiglio 2020). Alvise came from one of the most ancient and prestigious families of the city, which would give eight doges to the Republic. Gasparo received his first education at the School of San Marco with Giorgio Valla and Marcantonio Sabellico, who may have introduced him to Platonism. In 1500 he then started attending the School of Rialto, whose teachings mainly revolved around logic and naturalism. From 1501 to June 1509, he attended the University of Padua, together with Marco Musuro, Giovanni Calfurnio, Pietro Pomponazzi, and Alessandro Achillini. Unfortunately, the Siege of Padua, on June 1509, forced him to leave the city and go back to Venice, therefore leaving the university unfinished.

After several attempts started in 1512, he finally managed to obtain a public office in October 1518, when he was nominated *provedador sora la Camera de Imprestedi* (i.e., public debt officer). In the 9 years between his return to Venice and his appointment, he deepened his philosophical and scientific knowledge, by studying Euclid, Aristotle, St. Thomas, and Lucretius (Blum-Blum 2018). In that period, he made fundamental connections with many scholars, like Francesco Cattani, Alberto Pio of Carpi, and Trifone Gabriel. With two of his friends, Tommaso Giustiniani and Vincenzo Querini, monks in Camaldoli from 1510, he carried on an important correspondence: thanks to these letters we can rebuild the religious and social hesitations of a young aristocratic man, attracted to the eremitic life but at the same time strongly involved in the active participation to the public life of his republic (Jedin 1951, 1957; Gilbert 1968; Ross 1970; Massa 1988; Rossi 2011, 2013).

In 1517 Pietro Pomponazzi asked Contarini to review his *Tractatus de immortalitate anime* (1516) and took Contarini's comments in such a

great consideration that he devoted the first book of the *Apologia* (1518) to defend his own position (Burzelli 2019). Putting aside the usual malice toward his opponents, Pomponazzi understood the relevance of Contarini's comments and published them anonymously together with his own treatise. Contarini refused his master's proof that the immortality of the soul cannot be demonstrated from the Aristotelian point of view. By contrast, he underlined the essence of the soul as *forma per se subsistens*, namely, a form that can exist even out of its composition with the bodily matter. In doing so he was influenced by Avicenna's *De anima*, whose argument of the *Flying man* is explicitly quoted (Giaccon 1960).

In the same period, Contarini composed his first organic treatise, *De officio episcopi* (1517), in which he put forward a proposal for a renewed ethical life for the clergy and the bishops. The book was composed for Pietro Lippomanno, 13-year-old bishop of Bergamo. For the composition of this work, Contarini took the bishop of Padua, Pietro Barozzi, whom Contarini met during the university, as his ideal model. In this text he laid out the formation and virtues that a bishop should follow in his pastoral activity, as well as his responsibilities. Accordingly, a bishop should personally take care of his community, by regulating all the aspects of its ethical and religious life. Twenty years later, Contarini will devote to this care his treatise *De sacramentis christianae legis* (1540), a sort of manual of the form and the meaning of every sacrament.

The turning point of his political career was in September 1520, when he was elected ambassador of Venice at the court of Charles V, in Germany. He reached the Emperor in Worms on April 20, 1521, just few days after Luther's convocation. He saw the German monk in person during the Diet and judged his approach against Rome too radical, although he claimed that his religious beliefs were not completely wrong. In 1530 he would analyze every article of the Lutheran doctrine in his *Confutatio articulorum lutheranorum* (Contarini 1923; Ruckert 1926; Jedin 1949), with a critical but also constructive attitude: he always looked at what can bring people together, rather than what pits them against each other. For this

reason, he could appreciate some theoretical points of Luther's biblical interpretation, but, at the same time, he firmly rejected Luther's polemical attitude.

From Worms he followed the Emperor in Flanders, then in England, and finally in Spain, where he remained until August 1525. During this period, he came into contact with influential scholars like Thomas More, Giovanni Corsi, Sebastiano Caboto, and Antonio Pigafetta, and he personally visited the king of France, Francis I, prisoner in Madrid. While in Spain, he could alternate diplomatic activities with philosophical studies. He composed his *Compendium primae philosophiae*, reviewed and completed in 1527, in which he goes through the four scholastic transcendentals (*one, being, true, and good*) from a hypostatic standpoint: one and being, in a strong sense, are God as indivisible perfection; every other creature can only imperfectly partake of this ontological fullness (Robiglio 2018). The *Compendium* translates into a sixteenth-century perspective the same question on one and being that Pico and Ficino had already addressed in 1491 (Bartocci 2019). Finally, in Spain Contarini had first to face the Inquisition that suspected his brother and other Venetians of an illicit sale of prohibited books.

After his return to Venice, he first joined the *Collegio dei Savi di Terraferma* until 1527, and then he worked as ambassador of Venice for Ercole d'Este and from 1528 to 1529 for Pope Clement VII (Negrato 2010). During his service in Rome, he obtained the restitution of Milan to Francesco Sforza, but Venice lost Cervia and Ravenna. He also presided over the signing of the settlement in Bologna, where he remained until February 1530, in order to attend the imperial crowning of Charles V. His political career reached its peak in the following 5 years: he was designed *savio* of the Council, then in the Council of the Ten, fiscal revisor, official of the University of Padua, and ducal counselor. Finally, in May 1535 he was notified of his designation as cardinal of the Roman Church, even if he still was a layman. His election was probably fostered by the Venetian nuncio Girolamo Aleandro; nevertheless, its approval by Pope Paul III Farnese – who

was close to Contarini during the Roman embassy – sounded completely unexpected in Venice. According to Paolo Giovio's testimony, someone saw this elevation as the coming of a future angelic pope.

During these last Venetian years, he could complete important works like *De elementis* and *De magistratibus et republica Venetorum*. The first treatise deals with the four elements, which constitute the physical bodies, their origin, and their mixture. Contarini shows a deep knowledge of the physical ancient and medieval tradition, by quoting Alexander of Aphrodisia, Averroes, Avicenna, and Theophrastus. An interesting peculiarity of the text is that the author provides concrete examples of the constitution of the elements, taken from his voyages around Europe. In *De magistratibus*, probably begun in Spain, Contarini celebrates the harmonic constitution of the Venetian Republic, a mixture of democracy (public elective offices), aristocracy (the Council), and monarchy (the doge). This work seems fundamental since it lays down the foundation for the *Myth of Venice* (Gilbert 1969; Florio 2010). In the very months which preceded his election as cardinal, he composed the first of three important texts called *De potestate pontificis* (Contarini 1923): in this first one, he defended the divine origin of the power of the pope against some Venetian opponents like Sebastiano Foscarini. This work, that even met with nuncio Aleandro's approval, might have earned Contarini the red hat.

Contarini was firstly assigned to the diocese of Belluno, but he could hardly visit it, and thus he sent a minister, Girolamo Negri. Even when he was far, Contarini composed for the clergy and the preachers of Belluno some important instructions to educate the simple people: the *Modus concionandi* (1539) and *Instructio pro praedicatoribus* (1541). In these interesting writings, Contarini makes the point that preachers cannot talk to simple people about complex doctrinal issues like free will or predestination, and they rather must simplify their predication to few easy points, concerning penance and social activity. In 1536 he was deputed to a commission of prelates who were in charge of watching over any ecclesiastical violation: the

Consilium de emendanda ecclesia, which later flowed into the *Consilium super reformationem Ecclesiae*. He also wrote a useful analysis of the previous Christian councils, the *Summa conciliorum*, for the benefit of the commission (Friedensburg 1904).

In parallel with these official activities, he tried to induce the pope to a self-reformation (*De potestate pontificis in usu clavium and in compositionibus*), persuading him that the spiritual power was far more important than the political one, but this position was explicitly in contrast with the canonistic tradition (John of Turrecremata, Paul of Castro, Giambattista Caccialupi). During the Roman years, Contarini was often very close to the exponents of the *Spiritualism*: he was in touch with Vittoria Colonna, Reginald Pole, Marcantonio Flaminio, Bernardino Ochino, and Giovanni Morone (Jedin 1927). He personally found Valdes' ideas too radical, but at the same time, he could not hide an interest for the doctrine of God's election. His involvement with *Spirituali* seems evident, although ambiguous, from his letters *About free will* (1536, to Vittoria Colonna) and *About predestination* (1538, to Lattanzio Tolomei, now in Contarini 1923; Stella 1961; Blum 2017) and from his important commentaries on St. Paul's *Epistles*, which were read with interest by the heterodox circle. The ambiguity of his doctrine becomes evident in the question of justification. Contarini thought that humans can reach salvation thanks to a double input: on the one hand, God's election through grace, which seems the fundamental condition and, on the other hand, a free acceptance, which translates divine grace into a concrete ethical life.

In the last part of his career, Contarini was involved in the Diet of Regensburg (fall 1541). He was sent to Germany as representative of the pope, in order to mediate with the Protestants (Schultze 1879; Solmi 1907; Mackensen 1958, 1960; Matheson 1972; Lane 2004). With this aim, Contarini tried to find a middle formulation of the problem of justification (the so-called 'double justification'), but this solution did not meet with the approval of Luther and of part of the cardinals. As a consequence of this, after his

return to Italy, Contarini became more and more isolated. He tried to defend his position in a long letter to Ercole Gonzaga (*About justification*) which explains how to put together the two apparently incompatible ways to salvation (Hunermann 1921). In January 1542 he was nominated papal legate to Bologna where he had to deal with the heretical agitations of Modena (Casadei 1960). He was asked to write a *Formulario* with the aim of settling the dispute, but the attempt to find a compromise between heretical and catholic doctrines generated a deep ambiguity into the text. Gasparo Contarini suddenly died on August 24, in Bologna. The last man he met, Bernardino Ochino, an important representative of the *Spirituali* who was suspected of heresy, quickly escaped from Italy. Many of Contarini's works were published after his death in Italy (*De sacramentis, De potestate pontificis, Instructio*, Florence 1553) and France (*De elementis*, Paris 1548; *Compendium*, Paris 1556), without the permission of the family. The first official collection of his all works was published in Paris by his nephew Alvise in 1571 (Contarini 1571).

Conway, Anne

Born: 1631

Died: 1679

Alvin Snider

Department of English, University of Iowa, Iowa City, IA, USA

Abstract

Anne Conway (1631–1679) is best remembered as the author of a single book published posthumously, *The Principles of the Most Ancient and Modern Philosophy*. Conway worked out a metaphysics to account for the relationship between matter and spirit and found models for her writing in the philosophical and theological disputes of the day. Her treatise owes a particular debt to Jewish Cabbalism and English Quakerism. Conway based her philosophy on a spiritual monism that has affinities with vitalism while running counter to the mechanistic theories that shaped seventeenth-century scientific thought. Her book offers an eclectic mix that combines a

monistic theory of substance with Neoplatonist doctrines on the spirit of nature and sets forth a philosophy that remained in the shadows until its rediscovery in the twentieth century.

Introduction

Anne Conway (née Finch), Viscountess Conway and Killultagh (1631–1679), is best remembered as the author of a book published posthumously, *The Principles of the Most Ancient and Modern Philosophy*. First translated into Latin as *Principia philosophiae antiquissimae et recentissimae* (Amsterdam 1690), it appeared later as a re-translation into English of the probably lost original manuscript (Conway 1692). Writing at a time when a substantial segment of the market for printed books centered on devotional subjects and when literate women confided their opinions to manuscript, diaries, and letters, Conway belongs to a humanist tradition of “the learned lady.” An object of satire in comedies by Ben Jonson, Molière, and Aphra Behn, learned ladies also won their share of praise and admiration. Conway’s great gift for doing philosophy was recognized by a few contemporaries and preserved for posterity in a single treatise (Conway 1996).

Biography

Conway joined the privileges of wealth and pedigree to the benefits of private tutoring. Born to Sir Heneage Finch and his wife, Elizabeth Craddock, her father died a week before her birth in 1631. Considered unfit as a woman to attend university, she received instruction in the London mansion that eventually became Kensington Palace. Her family recruited Henry More (1614–1687), the Cambridge Platonist, to teach her religion and philosophy, and the two struck up a friendship that lasted from 1650 until her death. Their correspondence is preserved and available in a twentieth-century edition (Nicolson and Hutton 1992). More held Conway in the highest regard and in the dedication to one of his books commended her “singular *Wit* and *Vertues*”

(More 1655). In 1651, she married Edward Conway and took up residence at Ragley Hall, the family seat in Warwickshire. Fortunate in her marriage as in her mentor, Viscountess Conway assumed a place within an intellectual circle of family and friends and gained access to an extensive library assembled by her father-in-law. Her husband, made a fellow of the Royal Society in its first decade and created Earl of Conway in 1679, moved through the overlapping spheres of politics, religion, and philosophy. Among the guests invited to Ragley were Ralph Cudworth, Joseph Glanvill, and Jeremy Taylor. Francis Mercury van Helmont – a physician, Christian Cabbalist, and chemist – had a profound impact on her thinking toward the end of her life, when she also had conversations with early Quakers such as George Fox and George Keith. Conway supplied a bridge for members of her circle: van Helmont, for example, served as her personal physician and began to attend Quaker meetings in 1675. Conway's commitment to devising a metaphysics to account for the relationship between matter and spirit chimed both with the general European zeitgeist and with more local theological and scientific controversies (Duran 2006). Her conversion to Quakerism at the end of her life, against the wishes of friends and family, inserts her monism into a specifically English (and non-aristocratic) context. Just as Quakers regarded all bodies as replete with spirit, Conway affirms the presence of spirit in all things, while avoiding any imputation of pantheism by treating Christ as an intermediary between God and nature (Byrne 2007). She suffered from chronic pain throughout her life, particularly from excruciating headaches, and her monism encouraged her to make sense of how the mind and body suffer in conjunction and to develop a theodicy justifying the very existence of human suffering. Her life experience, as a result, directly underwrites important aspects of her philosophy and its characteristic concerns (Hutton 2004b).

Heritage and Rupture with the Tradition

The anonymous publication of the *Principia philosophiae*, under the supervision of van

Helmont, brought before the literate public a thinker well versed in the philosophy of her day. In it she asserts positions that owes more to theology, especially Jewish Cabbalism, than to the writings of René Descartes, chosen as a *maître à penser* by many of her contemporaries. Despite her criticism of Descartes, we find certain commonalities. Where Descartes posits the existence of three kinds of substance – God, mind, and body – Conway's own tripartite hierarchy divides among God, a middle term she identifies with Christ, and the creation. Conway introduces Christ, or "Middle Nature," or "Adam Kadmon" to fill in gaps left by a theory of dualism that she read critically and found wanting. This middle type combines properties but occupies a separate niche rather than sliding along a continuum. Christ stands as an intermediary between divine perfection and a creation regarded as a single substance comprised of numberless "monads" (not a term she uses frequently), which combine spirit and matter (Duran 2006). In the last category, she gathers all creation, positing the existence of a unified material world subject to mutability. If a thing were incapable of corruption, she reasons, it would be, in essence, God, whose divine attributes include immutability. Opposed to materialism no less than to Cartesian dualism, Conway rejects any picture of the world that treats nature as mechanical or machinelike, regarding it as endued with life and the powers of movement and perception. One recent study of Conway locates in her religious naturalism and vitalism an ethos that opposes the domination of nature and points toward a philosophy that places humanity in a new relation with other sentient beings (White 2008). For some readers, her work offers hints, if not a model, for a feminist epistemology and a conception of nature that breaks with paradigms long dominant in the West.

Innovative and Original Aspects

The influences that molded Conway's philosophy were varied and eclectic (Hutton 2004a). The Platonism of her mentor Henry More remains visible in much of her thinking. More considered

Cartesian dualism unequal to the task of explaining the interaction of mind and matter and offered a more fluid model of interaction to take its place. Conway built her system on More's foundation. The notion of the monad had roots in Renaissance Neoplatonist rewritings of the Cabala by figures such as Christian Knorr von Rosenroth (1636–1689), whose grounding in Jewish learning went far deeper than the dabbling of his contemporaries. In 1670 van Helmont met Henry More and introduced him to Knorr's work, and the combined influence of the men inspired Conway to undertake a serious study of cabbalistic texts in translation. Working toward a synthesis of Quakerism and Cabbalism became a goal of Conway and some of her friends who wrestled with questions involving the nature of God and His creation. For example, the Cabbalistic notion of an indwelling spirit – the Shekinah (שכינה) or presence of God – in some respects resembles the Quaker idea of the Inward Light or the Christ within. Conway also broke with the dualism of much Christian theology by regarding soul and body as a single substance, drawn together by their attraction for one another. The affinity of soul for body arises from the similarity and desire they both have to unite with one another. Any “body” bereft of spirit and perception becomes dead matter or no body at all, analogous to the difference between a person and a corpse. Between soul and body, there exists a “love” that rests on their shared single nature and mutual recognition of goodness in one another (Broad 2002).

Impact and Legacy

A nineteenth-century commenter described Conway as “the profoundest and most learned of the female metaphysical writers of England” (Broad 2002; quoted p. 65). Earlier, Gottfried Wilhelm Leibniz acquired some familiarity with her work, but the extent of Conway's influence on his monadology remains doubtful (Brown 1990, 83–84). Conway's book presents a pathway diverging from the mechanist materialism that eclipsed other systems in the seventeenth century,

while not abandoning natural philosophy altogether. The author of the *Principles* found the moral implications of Cartesian mechanism objectionable and disallowed the sort of materialism she encountered in modern philosophers such as Thomas Hobbes and Baruch Spinoza (Hutton 2008). In their place she established what one contemporary student of her writings describes as “a clearly argued concern for all of nature, and the place of humankind within that nature” (Duran 2006), an intellectual departure that continues to give rise to new appreciations of her book.

Copernicanism

Pietro Daniel Omodeo

History of astronomy and philosophy, Max Planck Institute for the History of Science, Berlin, Germany

Abstract

The historiographical category of Copernicanism is here discussed from the viewpoint of the reception of Copernicus's work in the cultural debates of the Renaissance. First, an account of Copernicus's *De revolutionibus* (1543) is offered. Then, different strands of reception and the most visible actors of this cultural process are considered: mathematical and astronomical (Reinhold and the Wittenberg School), natural philosophical and physical (Bruno, Galileo, and Kepler), and ethical and theological (up to the effects of the Catholic censure of 1616).

The Historiographical Problem

"Copernicanism," like most "-isms" in historiography, is an anachronistic interpretative category. It refers to a particular aspect of the reception of the Renaissance astronomer Nicolaus Copernicus, namely, to his heliocentric theory, and to the philosophical and cultural impact of his major work, *De revolutionibus orbium coelestium* (1543).

Moreover, "Copernicanism" is evocative of the idea of the Scientific Revolution as a major cultural, epistemic, and epistemological shift, which occurred between the sixteenth and the seventeenth centuries. According to the historian of science Alexandre Koyré, astronomy, in particular the Copernican system, was crucial to the formation of the modern scientific outlook hinged on a mathematized view of nature, space infinity, and cosmological homogeneity. The philosopher and historian of science, Thomas Kuhn, reinforced this narrative treating the "Copernican Revolution" as the *paradigmatic case* revealing of the "structure" of scientific advance in general. "Scientific revolutions," he argued, are intellectual shifts undermining well-established knowledge systems, just like how the Copernican theory exploded the Aristotelian-Ptolemaic worldview. This narrative looked verisimilar in the light of Renaissance reflections on Copernicus's achievement, such as Giordano Bruno's celebration of the historical meaning of Copernicus as "the dawn which must precede the rising of the Sun of the ancient and true philosophy, for so many centuries entombed in the dark caverns of blind, spiteful, arrogant, and envious ignorance" (Bruno 1995, p. 87). Additionally, Galileo Galilei's *Dialogo sopra i due massimi sistemi del mondo* (1632) conveyed the sense of a radical opposition between "Two Chief World Systems," the Ptolemaic and the Copernican. The Catholic prohibition of the heliocentric system (1616) and the persecution of Galileo for its dissemination (1633) suggested to later historians the sense of an irredeemable contrast between scientific advance and tradition qua religion.

Recent historiography has casted into doubt many points of this narrative of the Copernican discontinuity, since they rested on oversimplifications. First, no unity existed between Aristotelian and Ptolemaic approaches to the heavens; thus, the very idea of an Aristotelian-Ptolemaic paradigm to be undermined and superseded is problematic. In the Middle Ages, natural explanations versus mathematical accounts of heavenly phenomena dependent on the two *auctoritates* of Aristotle and Ptolemy were often perceived to be in strong contrast. Second, early mathematical

readers of Copernicus often neglected the cosmological issue (heliocentric astronomy and its physical implications). Many mathematicians were rather interested in the computational problems regardless of planetary hypotheses. Third, there is much continuity between Copernicus and his ancient and medieval precedents. Most importantly, he followed the Ptolemaic approach to mathematical astronomy.

For these reasons, it is convenient to abandon the Koyrean and the Kuhnian narratives and to address in the following the issue of Renaissance “Copernicanism” from the viewpoint of the multifaceted receptions of Copernicus.

Copernicus’s Astronomical Proposal: Strengths and Weaknesses

Copernicus’s *De revolutionibus* is an all-encompassing astronomical work, composed according to the example of Ptolemy’s *Almagest*. Its structure is the following:

- Book One: Foundational book, with discussion of general cosmological and natural issues, plus trigonometry
- Two: Spherical astronomy and catalogue of the fixed stars
- Three: Precession of the equinoxes and solar theory
- Four: Lunar theory; distance, parallax, and apparent diameter of the Sun and the Moon; and eclipses
- Five: Planetary theory of longitude
- Six: Planetary theory of latitude

The comprehensiveness of this synthesis of astronomical knowledge was perceived as a valuable achievement. It is precisely on this account that Copernicus was often mentioned during the Renaissance as *Ptolemaeus alter*, referring to his capacity of standing comparison with the most authoritative astronomer of antiquity.

De revolutionibus had also other qualities that were universally acknowledged. As Copernicus’s pupil Rheticus stressed in the *Narratio prima* (1540), the first printed report on the astronomical

novelties of *De revolutionibus* brought together ancient and medieval astronomical data with new observations gathered by Copernicus himself, following a “geometrical method” (Rheticus 1959, pp. 109–110). This permitted him to offer updated or improved parameters for the precession of the equinoxes, for the solar and lunar theory, as well as for planetary motions.

A theoretical aspect Copernicus paid particular attention to was the construction of planetary models in accordance with the so-called *axioma astronomicum*. According to it, planetary motions shall be uniformly circular around their centers or result from the composition of circular uniform motions. Copernicus’s models were in fact so designed as to substitute the Ptolemaic equant by means of epicyclical devices. His solution had wide success among German scholars, especially thanks to the work of the Wittenberg astronomer Erasmus Reinhold and of his pupils.

Moreover, Copernicus’s heliocentric (or, rather, *heliostatic*) model offered simple and intelligible accounts for features that needed special constructions from the viewpoint of Ptolemaic theory, such as retrograde motions and planetary elongations. Furthermore, assuming the uniformity of speeds of the celestial bodies on their circles, the heliocentric theory permitted to establish the proportion between planets’ annual periods and their distances from the cosmological center without ambiguities (while in a geocentric perspective, the periods of the inferior planets do not correspond to their order). Copernicus used in fact the Earth-Sun distance as the yardstick to determine all planets’ distances and to establish the order of our system.

While Copernicus’s contemporaries and direct followers were ready to acknowledge the inclusiveness of his work as well as his observational and computational improvements, the excitement for the respect of the principle of circular uniformity was less universal even though it was shared by a very visible scientific community, namely, by scholars stemming from the so-called Wittenberg School (i.e., scholars trained in mathematics at Melanchthonian universities). As to planetary theory, terrestrial motion, and solar centrality and immobility, these issues remained the most

controversial of the Copernican proposal due to many difficulties, the most relevant of which can be grouped as follows:

- (a) The contrast with common sense: The motion of the Earth, in spite of its velocity, is not perceived by our senses.
- (b) Astronomical shortcomings: The Earth is apparently always located in the center of the celestial “sphere.” Its de-centration should trouble celestial appearances. For instance, the horizon of an observer on Earth always appears to bisect the heavens into two equal hemispheres. Copernicus claimed (*De rev.* I,6) that the Sun-Earth distance is negligible relative to the dimensions of the heavens. In other words, the annual revolution of the Earth around the Sun forces a heliocentric astronomer to greatly enlarge the distance of the stars from the last planet of our system (and to momentarily augment the extension of cosmic space).
- (c) Physical shortcomings: Terrestrial motion subverted existing explanations (embedded in the Aristotelian theory of natural places) accounting for physical phenomena on Earth such as the fall of heavy bodies. Terrestrial motion was at odds with the Aristotelian assumption that the gravitational center and the cosmological center (almost) coincide, and that natural motions are simple (and cannot result from the composition of two motions as would be the case for falling objects on a moving Earth, displaced at the same time vertically toward the terrestrial center and circularly about the same center).
- (d) Theological difficulties: Several Biblical passages refer to the immobility of the Earth and the motion of the Sun (e.g., Joshua 10.12–14 and 2. Kings 20:8–11). In order to reconcile Copernican theory and the Bible, one ought to abandon a literal exegesis of these passages and therefore to dismiss the interpretations of the Fathers of the Church and of the most credited theologians.

In the face of these problems (cognitive, mathematical, physical, and theological), the

geokinetic and heliostatic thesis met with strong opposition, despite the general appraisal of Copernicus’s geometrical models and improved parameters.

The Astronomical Reception of Copernicus

Reinhold’s *Prutenicae tabulae* (1551) inaugurated the mathematical-astronomical reception of Copernicus. These *first* “Copernican” tables met with immense success, first in Germany and then on a European scale. They constituted a valid alternative to the earlier *Alfonsine tables* (from the thirteenth century) and offered a basis for new tables and ephemerides – such as Johannes Stadius’s *Ephemerides novae et exactae* (1556), Antonio Magini’s *Ephemerides coelestium motuum... secundum Copernici hypotheses, Prutenicosque canones* (1582 and later editions), and David Origanus’s *Ephemerides novae* (1599) – until Johannes Kepler’s *Tabulae Rudolphinae* (1627) supplanted the Reinholdian computational tradition.

Besides, mathematical astronomers discussed and reworked Copernicus’s planetary theory along two diverging lines, geocentric and heliocentric. In fact, the systematic character of Copernicus’s theory could be maintained also in a geocentric perspective, to be exact, in a geo-heliocentric. Therefore, many scholars found it expedient to translate Copernicus’s theory into a geocentric, as was the case for reputed geo-heliocentrists such as Nicolaus Raimarus Ursus and Tycho Brahe (► [Geocentrism](#)). In the *Astronomia nova* (1609), Kepler, who was aware of the intricacies of post-Copernican transformations of planetary theory, regarded geo-heliocentric systems not in radical opposition to heliocentrism. Rather, they appeared to him as alternative options directly descending from Copernicus’s theory. As he wrote,

[One] should be aware that there are two schools of thought among astronomers, one distinguished by its chief, Ptolemy, and by the assent of the large majority of the ancients, and the other attributed to more recent proponents [...]. The former treats the

individual planets separately and assigns causes to the motions of each in its own orb, while the latter relates the planets to one another, and deduces from a single common cause, those characteristics which are found to be common to their motions. The latter school is again subdivided. Copernicus, with Aristarchus, of remotest antiquity, ascribes to the translational motion of our home the Earth the cause of the planets' appearing stationary and retrograde. Tycho Brahe, on the other hand, ascribes this cause to the Sun, in whose vicinity he says the eccentric circles of all five planets are connected as if by a kind of knot (not physical, of course, but only quantitative). Further, he says that this knot, as it were, revolves about the motionless Earth, along with the solar body. (Kepler 1992, p. 47)

In other words, heliocentrism and geo-heliocentrism developed as systems genetically related but mutually exclusive, which is a situation that often emerges in the history of science.

As far as heliocentrism is concerned, Kepler's work marked a fundamental step. Whereas geo-heliocentrists stuck to the astronomical axiom of circular uniformity but renounced terrestrial motion, Kepler, the other way round, maintained the heliocentric thesis while renouncing the astronomical axiom about the uniformity of speed of circular motions in planetary theory. In the *Astronomia nova*, he presented his theory of the elliptical orbit and nonuniform speed of Mars and then extended to the other planets. He accounted for that not in geometrical terms, as was usual, but rather in "physical" ones. In other words, he offered a causal explanation, individuating the forces out of whose action planets' paths result, in particular a vital force emanating from the Sun (► [Astronomy](#)).

The Natural Reception

Copernicus was well aware of the natural philosophical questions raised by his planetary theory. Therefore, in the first book of *De revolutionibus*, he treated the Aristotelian and Ptolemaic objections against terrestrial motion in detail. In particular, he hinted to a possible alternative physics, discarding the theory of natural places and the related idea that sublunary bodies can be *naturally*

moved only along straight lines, upward or downward. Rather, he based on Neoplatonic and Plutarchian insights his redefinition of circular motion as the *only* natural one (especially the circular motion of the terrestrial element and of our terraqueous globe) and reduced vertical motion to the violent tendency of the parts to rejoin their whole.

Besides, Copernicus's cosmology opened up a series of natural possibilities that only later supporters of his theory fully assessed. First, the axial rotation of the Earth made it possible to conceive of the heavens as infinite, since the principal Aristotelian argument in favor of cosmological finitude was based on the observation that the starry sphere could not accomplish the daily rotation if it were not finite. Second, the annual revolution of the Earth around the Sun implied its celestial location and its transit through the heavens like the other planets. This virtually discarded the distinction between a corruptible sublunary realm and an unalterable superlunary, suggesting cosmological homogeneity. Third, the momentous enlargement of the distance of the stars from our system raised the question about the existence of a physical void. All of these theses were in stunning contrast with the dominant Aristotelian doctrines about nature and the heavens.

Giordano Bruno was the first philosopher who fully developed these perspectives. Space infinity, cosmological homogeneity, and the existence of the intra-atomic void along with heliocentrism were pillars of his vision of nature. In addition to this, he asserted the infinite plurality of heliocentric systems, on the basis of an equation between the Sun and the other stars. Bruno presented his doctrines in several publications, in particular in the philosophical dialogues *La cena de le ceneri* (1584), *De l'infinito, universo e mondi*, and in the Latin poem *De innumerabilibus et immenso* (1591). His views had a lasting impact on the conceptions of the next century, beginning with Descartes's multicentric, homogeneous, in-definite, and corpuscular cosmology.

Through telescopic observations, Galileo Galilei reinforced the thesis of celestial homogeneity (e.g., through observation of the lunar asperities) and multi-centrism (testified by the Jovial

satellites). The observation of the phases of the inner planets indisputably showed their solar orbit. Therefore, Ptolemaic geocentrism was demonstrated to be untenable on empirical basis. Moreover, in his *Dialogo sopra i massimi sistemi* (1632), Galileo rejected the most important geostatic arguments on the basis of his proto-inertial physics and pointed to the phenomenon of the tides as evidence for terrestrial motion. He also extended the application of Renaissance mechanics to cosmological problems (e.g., through the treatment of the terrestrial globe by analogy with a turning wheel). In this manner, Galileo furthered the alliance between mechanics and Copernican astronomy initiated by his direct forerunner, Giovanni Battista Benedetti.

Kepler's physicalization of mathematical astronomy (already mentioned) was fundamental in the assessment of the natural dimension of the heliocentric theory. For the treatment of the solar system as a mechanical system of interacting forces, his work paved the way to later syntheses such as the Newtonian.

Ethical and Theological Concerns

Many scholars in cultural and intellectual history pointed out the moral implications of the Copernican system. The loss of centrality of the Earth in the cosmos implied, in fact, the decentralization of humankind and a new image of it. This de-anthropomorphizing tendency did not necessarily entail negative consequences as far as the conception of human beings is concerned and the assessment of its place in nature. In fact, as Arthur Lovejoy remarked, the novel world vision emancipated humanity from the theologically tinged and "diabolocentric" cosmology of the Middle Ages that confined it in the (physically and morally) lowest place of Creation. Drawing on Cusanian suggestions (► [Nicholas of Cusa](#)), Bruno was particularly emphatic on the freeing potential of the celestial transposition of the Earth, as well as of his cosmological infinity. Yet these novelties were not easily reconcilable with the letter of the Bible and the theological tradition.

Copernicus and his entourage were aware of the tensions between heliocentrism and Biblical

exegesis. Reconciliation was only possible at the expenses either of Biblical literalism or of physical realism. Copernicus and his friends and collaborators chose the first path, that is, accommodating the Scriptures to natural knowledge. The Bishop of Chelmno, Tiedemann Giese, authored a lost apology, *Hyperaspisticon*, in favor of heliocentrism, while Rheticus penned a defense of the scriptural tenability of the Copernican planetary theory, which is today known as *De Terrae motu et Scriptura Sacra*. The Lutheran theologian Andreas Osiander chose a different path. He inserted an anonymous introduction in the first edition of *De revolutionibus* in which he invited the reader to take Copernicus's planetary theory as purely hypothetical and as solely aimed at computation.

In spite of these cautions, theological reactions accompanied the earliest reception of the Copernican hypotheses. Luther is reported to have commented on him: "That fool wants to distort the entire astronomy." Additionally, his close associate Philip Melancthon rejected heliocentrism for physical and theological reasons, as is evident from his criticism in the textbook of natural philosophy, *Initia doctrinae physicae* (1549¹ and 1550²). In Rome, the Master of the Sacred Palace, Bartolomeo Spina, and his Dominican brother Giovanni Maria Tolosani were the first Catholic critics of Copernicus's theory. The latter's anti-Copernican objection, *De coelo supremo immobili et Terra infima stabili, ceterisque coelis et elementis intermediis mobilibus*, remained unpublished only due to an untimely death in 1549.

In the *Cena* (1584), Bruno tackled the scriptural problem and proposed to read the Bible according to the principle of accommodation. Accordingly, the Bible is written in a manner that is comprehensible for the common people; it does not deal with natural issues, but only with moral ones. Galileo later affirmed the same principle in reaction to religious opponents, in a letter (21 December 1613) to his friend and collaborator, the Benedictine Benedetto Castelli, and in the revised and extended version of this text, addressed to his protectress, the Grand Duchess Christina of Lorraine (1615). In parallel, the Calabrian Carmelite Antonio Foscarini published his

Lettera sopra l'opinione de' Pitagorici e del Copernico (1615), in which he argued that the doctrine “of the mobility of the Earth, and stability of the Sun, held in ancient times by Pythagoras, and then put into practice by Copernicus,” was not at odds with philosophy or with theology.

In spite of these efforts toward reconciliation, the Catholic censure arrived in 1616. On 24 February 1616, three Father Theologians of the Holy Office declared that solar immobility and centrality is “foolish and absurd in philosophy, and formally heretical,” whereas terrestrial motion is “at least erroneous in faith.” On this basis, the Sacred Congregation of the Index decreed on 5 March 1616 the prohibition of all books defending the “Pythagorean” cosmology and suspended *De revolutionibus* “donec corrigatur.” The Cardinal Inquisitor Roberto Bellarmino, who had played a major role also in the condemnation of Bruno to death for heresy, immediately communicated the ban to Galileo and forbade him to teach and circulate impious cosmologies. These events, followed by the trial against Galileo and his abjuration of the Copernican system in 1633, produced a confessionalization of astronomy and a bifurcation of the discussion of planetary theory and of the scientific culture in Catholic and protestant countries.

Zografou, Greece

Abstract

Nicolaus Copernicus (1473–1543) – astronomer, mathematician, physician, and Catholic clergyman – was one of the most important contributors of the Scientific Revolution due to the formulation of the heliocentric model of

the universe, according to which the earth revolved around the stationary mean sun. He managed to provide an astronomical system consistent with the apparent motions of the celestial bodies and also explain the exact necessary order and the inner coherence of the universe by following the Aristotelian distance–period relationship and the postulate for the uniform circular motion. Although the system presented in his book *De Revolutionibus Orbium Coelestium* (*On the Revolutions of the Heavenly Spheres*) was as complex as that of Ptolemy, the harmonious order of his geokinetic model led to the foundation of modern [astro]physics. His scholarly interests included economics, politics, and translation of ancient Greek texts.

Koppernigk, Niklas

Biography

Nicolaus Copernicus was born on 19 February 1473 at Toruń, a thriving merchant town, right next to the Vistula river, as the youngest of four children. When Nicolaus was 10, his father, a merchant and very active in the political affairs, passed away. Lucas Watzenrode (1447–1512), the maternal uncle of Nicolaus, and eventually the bishop of Warmia, came to the family's aid, and influenced Nicolaus' studies. As such he attended the elementary school at Toruń, in which he learned Latin, the language of the intellectual world. In 1491 Nicolaus enrolled in the arts program of the Jagiellonian University in Cracow. The list of the University's lectures shows that the treatises of Georg von Peurbach (1423–1461) and Regiomontanus (1436–1476), e.g., *Epitoma in Almagestum Ptolomaei*, were among the standard textbooks, which became a crucial factor for the emergence of Copernicus' interest in astronomy (Berry 1898: 94). Among his collection of books preserved today (i.e., the *Alfonsine Tables*, Regiomontanus' *Tabulae*

directionum, In iudiciis astrorum by ‘Alī ibn Abī l-Rijāl, Euclid’s *Elements* with Campanus’ commentary) (Swerdlow and Neugebauer 1984: 4) some contain calculations in Nicolaus’ handwriting which date back to the days when he was a student at Cracow (Swerdlow 2000: 162–168). It is worth noting that some of them give the impression that he had already begun to take the first steps in the conception of his new system. At any rate, Nicolaus left the university after 3 years of study, probably in 1494, without taking a degree, which was not unusual at that time.

During the next year or two he lived partly at Watzenrode’s palace at Heilsberg, and in 1497 he assumed an administrative position (canon) of the Chapter of Warmia. Meanwhile his life was about to change once again: from 1496 to 1505 or 1506 Copernicus studied in Italy (at first canon law in Bologna) with only a short break in 1501. In 1497, he met the influential professor of astronomy Domenico Maria Novara da Ferrara (1454–1504), and expanded his own knowledge of astronomy by assisting him with his observations. Novara described Copernicus as *non tam discipulus quam adjutor et testis observationum* (not so much a student as an assistant, and witness to the observations) (Koyré 1973: 21). He embraced the “renaissant” Pythagorean and neoplatonic ideas, dominant at the time. And apart from law, he studied ancient Greek, medicine, and philosophy. From Bologna Copernicus proceeded to Rome in 1500, a year declared as Jubilee by the Catholic Church. Copernicus gave lectures on mathematics in Rome before a large crowd of students, important men, and experts (Swerdlow and Neugebauer 1984: 5).

In 1501 Copernicus returned home, but only for a short period, for he received further leave of absence in order to study medicine at the University of Padua – one of the most distinguished institutions in Europe – and serve as medical advisor to Lucas and members of the Chapter. We know very little about his studies in Padua, but we can have a glimpse about it from Siraisi who has highlighted the prominent role of astrology in medicine (Siraisi 1990: 16). Whatever the truth of this, Copernicus probably showed no interest in astrology throughout his life (Omodeo

2014: 134–136; Kuhn 1957: 94). Finally, in the mid of 1503 he received his doctorate in canon law from the University of Ferrara. After the completion of his studies, Copernicus returned to Heilsberg, assisting his uncle Lucas and helping him when the later became ill. Eventually, Lucas Watzenrode died in 1512, and so Copernicus left Heilsberg for good, moving to the Cathedral of Frombork, where we find him staring at the night sky on 5 June during an opposition of the planet Mars.

Despite the fact that Copernicus did not publish anything important in astronomy throughout his life, his fame as an astronomer appears to have been settled among experts. Indeed, as Dreyer has mentioned, when the question of the reform of the calendar was brought before the Lateran Council in 1514, Copernicus was invited to give his opinion on the subject by Paul of Middelburg (1446–1534), Bishop of Fossombrone; but though he was supported by a personal friend and colleague, Bernhard Sculteti (1455–1518), the invitation was declined, as Copernicus did not think that the motions of the sun and moon had yet been sufficiently investigated to allow a final settlement of the problem (Dreyer 1953: 309). Copernicus’ research in astronomy had already taken an unexpected turn, and between 1510 and 1514 he had written a brief essay, which contained an account of his heliocentric (or rather heliostatic) astronomical system, the *Commentariolus*. Another important event happened about 1524: Copernicus wrote a critical evaluation of Johannes Werner’s (1468–1522) small treatise *De motu octavae sphaerae tractatus primus*. He pointed out Werner’s chronological error of 11 years which was made in the calculation of an observation made by Ptolemy.

In the final years of his life, Copernicus met an enthusiastic young astronomer, known as Rheticus (1514–1574), from the University of Wittenberg, who came to study alongside him. Rheticus began to eagerly study Copernicus’ manuscript and to press the great astronomer to publish it. Within a few weeks Rheticus published a valuable brief treatise to Copernicus’ ideas, the *Narratio Prima (First Report)*; and he finally convinced Copernicus to publish *De Revolutionibus*

Orbium Coelestium (henceforward *De Revolutionibus*), of which title the last two words were probably the addition of a Lutheran preacher, Andreas Osiander (1498–1552). Osiander also anonymously wrote a preface of the work claiming that the fundamental principles laid down in it “need not be true nor even probable. On the contrary, if they provide a calculus consistent with the observations, that alone is enough.” According to popular belief, Copernicus received a copy of his magnum opus on 24 May 1543, the day of his death (Koyré 1973: 34–42).

Astronomical Heritage and the Rupture with the Tradition

Both the principles and the scientific domain of astronomy before Copernicus were dominated by the Aristotelian conception of the physical world. According to these principles (*De Caelo* 286a3–286b9; 291a29–b10; *Meteorologica* 339a11–32; 340a19–341a13) the natural place of the four physical elements was the realm of eternal change, the so-called sublunary region, which contained the earth at the center of the world followed by the sphere of water, air, and fire, while the moon was the boundary between those

elements and the sphere of the unchanging, perfect celestial bodies, known as the superlunar region with the seven wondering stars or planets: moon, Mercury, Venus, the sun, Mars, Jupiter, and Saturn. Beyond the sphere of Saturn was the sphere of the fixed stars or the firmament. All the planets revolved around the earth as the true center with uniform circular motion (Fig. 1).

However, there was a serious gap between theory and observation. Instead of moving uniformly, the planets appear to move faster and slower, and even stop at times (stationary planets). While the sun and the moon move continuously along their paths from west to east (prograde/direct motion), the motion of the planets is usually from west to east relative to the stars; occasionally though they reverse their motion, moving from east to west relative to the stars (retrograde motion). Furthermore, planets appear to be closer and further away from the earth along their paths. As a consequence, ancient Greek astronomers developed an array of firm mathematical techniques to account for the celestial motions. Among these were the cosmological models of concentric spheres of Eudoxus of Cnidus (c.390–c.337 BC), Callippus (c.370–c.300 BC), and Aristotle (384–322 BC), and the Ptolemaic model, the mathematical tools of which were the

Copernicus, Nicolaus,

Fig. 1 The Aristotelian cosmos as portrayed in Gregor Reisch’s *Margarita philosophica nova*, Strasbourg 1508, sig. EE2^r. At the center are the four elements (earth, water, air, and fire); then comes the nested concentric spheres of the planets (the moon, Mercury, Venus, sun, Mars, Jupiter, and Saturn), followed by the firmament (the sphere of the fixed stars), the crystalline heaven, the First Mover, and the Empyrean Heaven (the dwelling place of God)

eccentric circle, the epicycle-deferent system, and the equant point (*punctum aequans*) (Neugebauer 1975: book 1). All astronomical systems presented, more or less, the basic tenets of geocentricism, but there was no widely accepted system.

Claudius Ptolemy (c.100–c.170 AD) wrote a work titled *Μαθηματικὴ Σύνταξις* (*Syntaxis Mathematica* in Latin, *المجسطي* (*al-majisṭī*) in Arabic – widely known as *Almagest*), which became one of the most influential books in astronomy ever written. Ptolemy laid the foundations of medieval astronomy. His system was sufficiently accurate to remain in use for approximately 1500 years. The first two introductory books contain his fundamental assumptions: that the earth is spherical endorsing the Aristotelian eclipse argument (*De Caelo* 297b30–34); that the heavens are spherical turning round a fixed axis and that the earth is in the center of the heavens, without motion, being but a point in comparison to the heavens.

Copernicus saw into the problems of the astronomical systems mentioned above. On the one hand, despite its conformity to the principle of uniform circular motion, the concentric astronomy contradicts the observations because it was impossible to explain the differences in the planetary distances. On the other hand, although the Ptolemaic astronomy agrees for the most part with the observed phenomena, it violates the principle of uniform circular motion due to the equant point. But the most important one was the inability of every astronomical system to discover the structure and form of the world (*forma mundi*), meaning the lack of certainty regarding the universes' *symmetria*: while some following the “principle of plenitude” (no vacuum between the nested celestial spheres) placed Venus and Mercury below the sun, others placed them above it because the sun has never been obscured by them when observed with the naked eye (i.e., the planet's apparent passage across the solar disk) (Vesel 2014: 67–76).

Another peculiar aspect was the relationship of those planets to the sun because they can only be in conjunction with and never in opposition to it (i.e., conjunction means that the sun and planet

have the same ecliptic longitude; and opposition means that the sun and planet are exactly 180° apart in the sky). Ptolemy solved that problem with an even more peculiar proposition having Mercury and Venus move in epicycles, whose centers are fixed on the line joining the sun and the earth. Ptolemy introduced this relationship due to the maximum elongation of those planets (~47° for Venus and ~28° for Mercury). As a result, according to Ptolemy, the sun separates the spheres of the three planets that are observed in opposition and the two that are not: “For by putting the sun in the middle, it is more in accordance with the nature [of the bodies] in thus separating those which reach all possible distances from the sun and those which do not do so, but always move in its vicinity; provided only that it does not remove the latter close enough to the earth that there can result a parallax of any size.” (Toomer, 1984: 419–420).

Copernicus highlighted the problem regarding the implementation of the principle of full or limited elongation writing that “Ptolemy [Syntaxis, IX, 1] argues also that the sun must move in the middle between the planets which show every elongation from it and those which do not. This argument carries no conviction because its error is revealed by the fact that the moon too shows every elongation from the sun” (*On the Revolutions* 1992). It is worth noting that as for the outer planets (Mars, Jupiter, and Saturn), the radii of their epicycles always remain parallel to the earth-sun axis. Consequently, the Ptolemaic system displays an incredible aspect: the motions of all the planets are linked to the motion of the sun.

Innovative Aspects and Legacy

Despite the fact that the Copernican system was as complex as that of Ptolemy, the real superiority of the heliocentric model consists in the determination of the order and the relative distances of the planets. As Vesel has rightly argued “Copernicus seeks a principle of arrangement that can be universalized, a principle that applies to the entire universe evenly and that would not produce

inherently inconsistent and contradictory results. This requirement is satisfied neither by the ‘principle of plenitude’ nor by the principle of full or limited elongation. Instead of many principles of arrangement, which are all inconsistent and contradict each other, there must be *one* principle, one common measure that can be unambiguously applied to all the planets, or, in other words, to *All* (=universe). Cosmos must be governed by one principle that would arrange its parts in an inherently coherent and homogenous way” (Vesel 2014: 223).

The placement of the sun in the center was the key to the harmonious order of the universe. Copernicus’ first writing of heliocentrism was a small manuscript, which gives a general description of the new cosmological system regarding the heavenly motions. Copernicus had written *Commentariolus* by 1514, though it was never printed during his lifetime. In its first section Copernicus listed seven postulates, which, according to the great astronomer, are the ways of dealing with all the problems of ancient astronomy:

1. There is no one center of all the celestial circles or spheres.
2. The center of the earth is not the center of the universe, but only of gravity and of the lunar sphere.
3. All the spheres revolve about the sun as their mid-point, and therefore the sun is the center of the universe.
4. The ratio of the earth’s distance from the sun to the height of the firmament is so much smaller than the ratio of the earth’s radius to its distance from the sun that the distance from the earth to the sun is imperceptible in comparison with the height of the firmament.
5. Whatever motion appears in the firmament arises not from any motion of the firmament, but from the earth’s motion. The earth together with its circumjacent elements performs a complete rotation on its fixed poles in a daily motion, while the firmament and highest heaven abide unchanged.
6. What appear to us as motions of the sun arise not from its motion but from the motion of the

earth and our sphere, with which we revolve about the sun like any other planet. The earth has, then, more than one motion.

7. The apparent retrograde and direct motion of the planets arises not from their motion but from the earth’s. The motion of the earth alone, therefore, suffices to explain so many apparent inequalities in the heavens (Rosen 1971: 58–59).

These seven fundamental postulates formed the basis of the heliocentric system, which Copernicus exhibited in detail in his book *De Revolutionibus* which following the structure of Ptolemy’s *Almagest* consisted of six books:

Book 1 elaborates the basic natural philosophical principles of geokinetic astronomy (the universe is spherical; the earth forms a single spherical object with water; the motion of the heavenly bodies is uniform, eternal, and circular or compounded of circular motions; the immensity of the heavens compared to the size of the earth, concluding that the latter has multiple motions; and the order of the heavenly spheres).

Book 2 describes the notions of the heliocentric astronomy mentioned in the first book, and also gives a catalog of the fixed stars.

Book 3 deals with the precession of the equinoxes and the apparent motion of the sun.

Book 4 deals with the apparent motion of the moon.

Book 5 offers a heliocentric calculation for the planetary longitudes.

Book 6 explains the latitudes of the planets.

The essential principle of the Copernican system – the principle of uniform circular motion, which, according to Copernicus, was the only way to explain the periodicity of the celestial phenomena, is taken for granted – is the distance–period relationship, which means that the farther the orbit of a planet is from the center of its motion, the longer its period is. Indeed, the correlation between the mean planetary distances calculated by Copernicus (in his “Uppsala Notes” or “U” cataloged as Copernicana 4 at the Uppsala University Library;

Copernicus, Nicolaus, Fig. 2 The Copernican system from book I of *De Revolutionibus Orbium Coelestium*, presented in the Jagiellonian Library at Cracow University. The outmost of all is the immobile sphere of the fixed stars (1). Then is Saturn (2), which revolves in 30 years;

Jupiter’s revolution in 12 years (3); Mar’s revolution in 2 years (4); the annual revolution of the earth, together with the moon (5); Venus’ revolution in 9 months (6); Mercury’s revolution in 80 days (7). In the middle of everything is the sun. (Gingerich 2014: 37)

see table below) and the periods of the planets in his surviving autograph manuscript of *De Revolutionibus* is obvious (Fig. 2). Unlike Ptolemy, Copernicus managed to provide a coherent system in which all the apparent celestial motions could be explained (save the appearances, *σώζειν τὰ φαινόμενα* in Greek) with reference to one necessary principle that did not allow alternative arrangements of the celestial bodies.

*	Copernicus’ U notes in AU (Astronomical Units)	True Value in AU
Mercury ☿	0.376	0.387
Venus ♀	0.72	0.72
Earth ⊕	1.00	1.00
Mars ♂	1.52	1.52
Jupiter ♃	5.2	5.2
Saturn ♄	9.23	9.54

There were several advantages of the Copernican model. The Copernican lunar theory was far superior to that of Ptolemy. The apparent retrograde motion of the planets was explained with

reference to their relative positions in contrast to the ad hoc modification of large epicycles of the Ptolemaic model. It was clear now why Mars and Venus had longer retrograde arcs, large epicycles, and longer periods of invisibility than the outer planets in the Ptolemaic model: the spheres of Mars and Venus are the closest to the earth compared with the spheres of the outer planets. It was obvious why in the Ptolemaic model the centers of Venus and Mercury were fixed on the line joining the sun to the earth: they are inferior planets and as such always seen near the sun; why the radii of the epicycles of Mars, Jupiter, and Saturn always remain parallel to the earth-sun axis: they are superior planets. The earth was not the center of the universe anymore; it was an ordinary planet orbiting the sun. And that was precisely the problem, according to the traditional worldview.

The arguments against the motion of the earth came from theologians, philosophers, and astronomers. Protestants were the first that came up against Copernicus. Martin Luther (1483–1546) objected that Copernicus’ work went against specific verses from the Old Testament (especially

Joshua 10:12–13; Psalms 93; Ecclesiastes 1:5–6) “people gave ear to an upstart astronomer who strove to show that the earth revolves, not the heavens or the firmament, the sun and the moon. [...] This fool wishes to reverse the entire science of astronomy; but sacred Scripture tells us that Joshua commanded the sun to stand still, and not the earth” (Barker 2005: 34, n. 16). The Catholic Church had a similar but much slower reaction, condemning *De Revolutionibus* in *Index Librorum Prohibitorum* (1616). On the other hand, peripatetic astronomers and philosophers, using common sense arguments, objected that the movement of the earth was absurd due to the easily noticeable violent consequences that it would have, like non-vertical fall of objects, continuous blowing of the wind toward one direction, etc. While there were plenty of other objections, one of the most intriguing arguments was made by Tycho Brahe (1546–1601) concerning the absence of annual parallax and the immensity of empty space, which had to be assumed between the sphere of Saturn and the sphere of the fixed stars (Dreyer 1953: 360). Copernicus acknowledging this already, although he did not answer for the empty space, wrote that the absence of parallax “proves their immense height, which makes even the sphere of the annual motion, or its reflection, vanish from before our eyes” (*On the Revolutions* 1992).

The Copernican system was not immediately accepted, or even understood. *De Revolutionibus* was a very technical book, not meant for anyone who did not have a solid background in mathematics. “Astronomy is written for astronomers” Copernicus wrote in his dedication to Pope Paul III. It was a revolutionary thought that challenged well-established notions, like the Aristotelian disciplinary boundary between mathematics and physical philosophy. Indeed, as Westman has argued quite convincingly “Copernicus asserts implicitly the right of the astronomer to make new kinds of claims about the physical world. In disciplinary terms: an argument from geometry together with certain privileged observations is taken to be sufficient to refix the reference frame of the ‘real world’ and fundamentally to question the evidence of the senses on which much of the discipline of natural philosophy had been built”

(Westman 1980: 111). Many other astronomers followed popularizing, improving, and heavily modifying the heliocentric model. It served its purpose presenting well enough an alternative against a system of ideas that seemed immovable. In the decades that followed, many scientists were converted to the Copernican model. Computations using his new model proved to be more accurate and useful for new astronomical tables, like the *Rudolphine Tables* of Johannes Kepler (1571–1630). Ultimately, our understanding of the universe grew and evolved from Copernicus’ premise to what we have today.

Coressios, Georgios

Born: ci. 1570

Died: 1659

Dimitrios Paradoulakis
Hamburg, Germany

Abstract

Amateur naturalist, physician, and theologian of wide education and profound intellectual thought.

Biography

Born in Chios around 1570, Georgios Coressios was strained in his homeland studying near his scholarly uncle, Leonardo, and gaining solid knowledge of classical education, theology, and philosophy. Upon completing his basic studies, he followed the tradition of his time and travelled at the University of Padua for higher studies in medicine and philosophy (Sathas 1868; Legrand 1896). At the same time, he attended similar courses at the University of Pisa. It is in Pisa where Coressios carried out his academic career, since he became a professor of Greek studies at the university for the period 1609–1615. During his stay in the city, he is under the protection of the Grand Duke of Tuscany (Florence, Pisa) Cosimo II (1590–1621) de' Medici, but mainly his brother Francesco (1594–1614). As a professor in Pisa, Coressios participated in the discussion about the new ideas of his contemporary mathematician and astronomer Galileo Galilei (1564–1642)

contained in the latter's treatise entitled *Discourse on Bodies that Stay Atop Water, or Move in It* (*Discorso alle cose che stanno in su l' acqua, o che in qualle si muovono*) published in 1612. In his response of the same year entitled *Statement of the opinion of Aristotle on the floating bodies against the opposition of Mr. Galileo Galilei* (*Dicharazione dell' opinione d' Aristotile, intorno al galleggiare della figura contro l' opposizione del Sig. Galileo Galilei*), Coressios criticized Galileo's opinions based on his strong faith toward Aristotle and his commentators, along with his personal experience. Nevertheless, Galileo, who also enjoyed the support of Duke Cosimo, finally prevailed. In 1615, Coressios' contract at the university ended without being renewed anymore (Stoupakis 1992).

With the completion of his academic career, the Greek scholar possibly worked as a physician firstly in Pisa and then at Livorno. Definitely, however, he returned to his homeland Chios before 1618, where he continued to practice his medical profession. Having earned the reputation and prestige as a university professor, he developed pedagogical activity as a teacher at the local School of the Orthodox Religious Fraternity of Agioi Anargyroi. There he taught ancient Greek, rhetoric, theology, and philosophy, as well as introductory lessons on medicine and natural philosophy. Furthermore, he proceeded to the composition of medical, philosophical, and theological writings. Being highly appreciated by the Patriarchate of Constantinople, Coressios observed closely and intervened on the dogmatic and confessional disputes of his time. Shortly before 1633, he made a brief journey to Constantinople at the invitation of the Patriarchate in order to counteract the active Calvinist theologian and chaplain of the Dutch Embassy Antoine Leger, who uninterruptedly promoted the principles of his confession through his theological treatises and pastoral activity. In the case of Leger as well as in later similar cases, Coressios contributed to the defense of the Greek Orthodox faith by constantly proceeding to the refutation of the arguments raised by the Protestants and the Jesuit missionaries in Constantinople. Coressios' firm attachment to Orthodoxy offered him the recognition by his contemporaries (Gabriel Seviros,

Theophilos Corydaleus, Paisios Ligarides, Patriarchs Nektarios and Dositheos of Jerusalem, Gerasimos Vlachos) as the main representative at his time of the Greek Orthodox theological theses. At the same time, however, he drew intense dissatisfaction and became the target of numerous criticisms by representatives of opposite ideologies (Cyril Lucaris, Leone Allacci, Ioannes Matthaios Karyofyllos, Nikolaos Komnenos Papadopoulos). Coressios died in his homeland in 1659 (Stoupakis 1992).

Impact and Legacy

Georgios Coressios' writing production consists of textbooks, treatises, and commentaries focusing on the interpretation of the Aristotelian corpus. A prolific writer, the scholar from Chios dealt in his works with topics of rhetoric (classical and ecclesiastic), grammar and epistolography, theology (exegetical, doctrinal, polemical), and poetry. His philosophical writings served educational purposes and belonged to the tradition of the early modern Greek commentaries on the Aristotelian Logic, Physics, and Metaphysics. Apart from the particular subject of each treatise, Coressios proceeded to the quotation of a number of other scientific fields: mathematics, medicine, astronomy, chemistry, and mineralogy. He mainly referred to Aristotle as the undisputed authority in all fields of knowledge and his ancient commentators (Ammonius, Simplicius, Alexander of Aphrodisias, Themistius, John Philoponus). However, he did not hesitate to rely on works from the patristic, early Christian, and medieval – scholastic and early modern theological literature. Although he seems to deal with both traditions (classical and ecclesiastical) in his interpretation of Aristotelian thought, Coressios adopted in a more modest extent the tendency by Theophilos Corydaleus to the distinction in his word of the theological thought from the purely philosophical reason. Methodologically, Coressios engaged a parallel activity: firstly, his interpretation of the philosophical terms and topics of the Aristotelian texts and, secondly, his own original argumentation on various philosophical questions. He

critically presented the opinions of Aristotle and the other philosophers, while he did not hesitate to argue and reject those theses which opposed to his philosophical and religious beliefs. Often he proceeded to the development of his own analysis and conclusions, presenting his personal view on the various philosophical matters he studied.

Abstract

Laurentius Corvinus was one of the foremost humanists in early sixteenth-century Silesia. His writings introduced three important

intellectual currents into the civic humanism of Breslau (Wrocław): first, the literary humanism of Conrad Celtis; second, a combination of the Franciscan spirituality of Bonaventure and the Renaissance Neoplatonism of Marsilio Ficino; and third, Lutheranism.

Biography

Corvinus enrolled at the University of Kraków in 1484 (see Bauch 1883 and McDonald 2007 for the outlines of Corvinus' biography). After gaining his BA and MA, he lectured there on Aristotle's *On the soul* and *Posterior Analytics*, Boethius' *Consolation*, and Vergil's *Georgics*. He attended Conrad Celtis' classes at Kraków in 1489–1491 and later corresponded with him. His students there included Heinrich Bebel, and perhaps Nicolaus Copernicus. Bebel later arranged for the publication of Corvinus' first book, *Cosmography* (Basel, 1496), in which he expanded the geographical picture derived from his classical sources with poems describing Poland and Silesia. Several Latin poems by Corvinus from his time at Kraków have survived, primarily in manuscript, including mythological poems and pieces addressed to members of the Polish royal family (Krókowski 1962).

In 1494, Corvinus was appointed as schoolmaster at Schweidnitz (Świdnica), where he wrote the first of three successful Latin textbooks, *The structure of poetry* (1496), in which he shows an incipient interest in Plato's theory of poetic inspiration (Glomski 1999). In 1496 or 1497, Corvinus was appointed as rector of St Elisabeth's school in Breslau, where he wrote and published two further textbooks, *Idiomatic Latin* (c. 1498) and *Garden of elegant usage* (1502). His extensive mythological poem *Apollo and the Nine Muses* (1503) is accompanied by an encyclopedic commentary that attests to Corvinus' broad erudition. In 1500 and 1502, Corvinus and his students staged the first known productions of Roman comedy north of the Alps since antiquity. In late 1502 or 1503, Corvinus married and found a new position as city secretary (*Stadtschreiber*) at Breslau. In 1506, he was appointed as city

secretary at Thorn (Toruń), where he associated with Nicolaus Copernicus. Corvinus contributed a poem to Copernicus' translation of the letters of Simocatta (1509), which describes his permanent return to Breslau in mid-1508.

In 1516, Corvinus published his major work, *A Dialogue with the Divine Mind*, a fictional conversation between himself and Mens, a personification of the second ontological principle in Neoplatonic metaphysics. The work is a prosimetrum, like its formal model, Boethius' *Consolation of Philosophy*. Here Corvinus expounds Ficino's anthropology, based on the conflicting carnal and spiritual elements within the human person. Mens proposes an educational curriculum based on Plato, whose philosophy she praises as compatible with Christianity. Mens also recommends that believers should meditate on the passion of Christ and model their lives after that of the suffering Savior. To assist such contemplation, Corvinus edited Bonaventure's *Hours of the Passion*, augmenting the liturgy with invitatories and office hymns, which he set to music. Corvinus established a chantry at St Elisabeth's church in 1516 to perform these offices, which were sung even after the parish converted to Lutheranism. Ambrosius Moibanus, the first Lutheran pastor of the parish, included Corvinus' office hymns and a poem from the *Dialogue* in his *Catechism* (1548).

While working as city secretary, Corvinus continued to teach privately and to publish poetry. The city council exploited his poetry as a political tool, as when he represented Breslau at the wedding of Sigismund I and Bona Sforza at Kraków in 1518, declaiming two poems in praise of the bridal couple.

Corvinus converted to Lutheranism in about 1522, and he assisted the preachers Johann Heß and Ambrosius Moibanus in introducing Lutheranism to Breslau. He defended Luther's theology at Heß's public disputation with the Dominicans in 1524 (McDonald 2008), and in an extended correspondence with the Catholic theologian Stanisław Byliński (published posthumously in 1531). Corvinus defended education against radical Reformers, and he helped to transfer the provision of welfare from ecclesiastical to municipal control.

Corvinus expressed a Christian humanism that united several different intellectual strands: civic

humanism; a conviction that correct and persuasive Latin style could bring about ethical improvement in the individual and society; a fusion of Franciscan spirituality with Renaissance Neoplatonism; and finally a new kind of piety that resonated deeply with the religious impulses of the educated bourgeoisie.

Cosmography in the Renaissance

Renzo Baldasso

Arizona State University, Tempe, AZ, USA

Abstract

Literally a description of heaven and earth, Renaissance cosmography was primarily confined to the terrestrial realm. In addition to verbal descriptions, cosmography found embodiments in graphic representations, known as *imago mundi* or *mappaemundi* and regional maps. Cosmography was connected with various branches of natural philosophy, including astronomy, cosmology, and geography. Though rooted in the medieval examples and textual traditions, during the Renaissance cosmography was transformed through the input of various cultural forces, ranging from the rediscovery of ancient texts offering descriptions of the world to the discovery of the new lands. In addition to flourishing through the continuity in some textual and graphic renditions, Renaissance cosmography and its maps aptly epitomize the achievements and innovations brought about in the early stages of the Scientific Revolution. These can be readily appreciated by comparing medieval *mappaemundi*, allegorical and nonmetrical in essence, with sixteenth-century Ptolemaic maps, which were measured, scaled, and based on mathematical projections.

Heritage and Rupture with the Tradition

In the medieval period, texts such as Isidore of Seville's *Etymologiae* and *De responsione mundi et astrorum ordinatione* (both first printed in 1472

by Gunther Zainer at Augsburg, both with woodcuts including a T-O map in the first and an elemental map and a climate-in-circles map in the second) proposed descriptions of the cosmos and invited creations of world maps. Of these, the most famous ones are the T-O maps, or schematic representations of the inhabited known world (Europe, Africa, and Asia), and zone maps devised according to the five *climata*. The fourteenth century saw the rise of “transitional maps” or world maps that combined these maps with information from portolans. These latter ones are nautical maps of the coastlines of the Mediterranean and Black Seas and European Atlantic side; taking as reference the magnetic North Pole, these maps functional for navigation were drawn since the 1200s and continued to be created in the Renaissance, thus exemplifying the continuity of mapmaking and map conception with the medieval period. Renaissance portolans were produced side by side with Ptolemaic maps, which are non-local, but of little use for navigation, and maintained a different audiences: Ptolemy’s maps interested a public of scholars and intellectuals.

In the Renaissance, the interest in cosmography is first signaled by Petrarch’s searches for manuscripts of lost classical texts on the subject. He recovered Pomponius Mela’s *Chorographia* or, as it will become known, *Cosmographia sive De situ orbis*. This first-century author, who had been praised highly in Pliny’s *Naturalis Historia*, married geographical and ethnographical information and had no mathematical component. In the fifteenth century, Mela’s *De situ orbis* remained popular and was printed before, in 1471, and reprinted more times than Ptolemy’s text.

Innovative and Original Aspects

Ptolemy’s text was rediscovered thanks to the manuscript brought to Florence by Manuel Chrysoloras in 1397, who held the chair of Greek. The interest generated by this text is captured by the opening scene in Poggio Bracciolini’s *De infelicitate principum* (1440) which presents

Cosimo de’ Medici, Carlo Marsuppini, and Niccolò Niccoli studying together a manuscript of Ptolemy’s work. Though humanists were primarily interested in the text rather than its graphic dimension, humanism and the *Cosmographia* maintained a close connection throughout the fifteenth century. Its reverberation in the larger cultural landscape is attested by the artist Lorenzo Ghiberti who, in his *Commentarii*, noted that in the Siena palace Ambrogio Lorenzetti painted an imperfect “Cosmography or all the inhabitable world [because] then they did not know about Ptolemy’s *Cosmographia*.”

Ptolemy’s *Cosmographia*, which in Greek carried the title of *Geographia* (or more precisely Γεωγραφικὴ σφηγγισ, or Guide to Geography), set the requirements for maps that they be the products of vertical perspective based on a uniform scale, with boundaries and important locations/points being the products of coordinates calculated through astronomical and geometric means. An important distinction set by Ptolemy is between geography and chorography: the first is quantitative and mathematical, and the second is qualitative and figurative. In addition to a new expectation for accuracy in maps, Ptolemy’s prescription for mapmaking supported a conception of space based on coordinates, longitude and latitude. The older historiography linked this “grid mentality” to the development of linear perspective, one of the pivots of the Renaissance paradigm. However, there is no actual proof for the connection between linear perspective and Ptolemaic projection methods.

Chrysoloras’s codex together with a separate map, a “cosmografia,” became properties of Palla Strozzi who treasured them highly as demonstrated by his will. Yet, it was not the Greek manuscripts and their copies that supported the cultural impact of this text. In Florence, Chrysoloras began composing a Latin version at the request of Coluccio Salutati who, like Petrarch and Boccaccio, had a special interest in toponymy; the Byzantine scholar died in 1406, and his translation was completed by his student, Jacopo Angeli – though also Leonardo Bruni volunteered to complete it. In addition to not including translations of the maps and the names on them,

Angeli's work proved wanting, and corrections were offered in Italy and beyond, including by Pierre d'Ailly in his *Compendium cosmographie* (composed around 1415 and printed with the *Imago mundi et tractatus alii* in 1480–1482 at Louvain). The Byzantine examples were also copied as independent maps, produced in Florence by Nicolaus Germanus and Piero del Massaio in the 1460s–1470s, and Enrico Martello (active 1480–1496), who were more than illuminators and also created new maps. A different but equally noteworthy innovation from this period is represented by the Harley Codex 3686 in the British Library: its unknown author married the coastline information of nautical maps with the Ptolemaic coordinates for the locales in the interior.

Strabo's *Geographia* was introduced in 1439 and offered a mine of textual information about the different regions of the works and their inhabitants; maps or graphic representations were not part of it. Recalling the humanists' interest in text, it is not surprising that Strabo was printed before Ptolemy and Mela: the editio princeps of his *Geographia* was published in 1469 by Conradus Sweynheym and Arnoldus Pannartz in Rome (their second edition in 1473) and in 1472 by Vindelinius de Spira in Venice, possibly the two most successful publishing houses in Italy at the time. The first edition of Ptolemy's *Cosmographia* appeared only in 1475 (Vicenza: Hermannus Liechtenstein), listing the coordinates of places but no maps, even though it includes four woodcut diagrams. Though the printing of Ptolemy's maps had to wait until 1477, it was a milestone in this history of the printed book. Appearing months apart, the second edition (Bologna: Dominicus de Lapis, 1477) and the third edition (Rome: Arnoldus Buckinck, 1478) offered, respectively, 26 and 27 folio-size maps. In both editions the maps are engravings; in the Bolognese edition, each map is one plate, while in the Roman edition, each map is the product of prints from two plates; these are the first large engravings to be integral to a printed book. Interestingly, these three editions of Ptolemy were in the works at the same time together with two more: a translation into Italian by Francesco

Berlinghieri that will be issued in Florence in 1482 and a revised Latin one with new maps and many corrections was at the top of the list of works to be published by Johannes Regiomontanus – his death cut short the enterprise of which left only a manuscript in Nuremberg library, but his effort will be recovered by Willibald Pirckheimer's 1525 edition of Ptolemy's *Geographia*, which also includes prints by Albrecht Dürer.

Impact and Legacy

Thanks to these and subsequent publications, Ptolemy's text gained currency in the culture and was also studied by Christopher Columbus (in the 1490 edition issued at Rome by Petrus de Turre). The Ptolemaic principles that had remained ideals, without finding rigorous application in practice in the drawing of maps throughout the fifteenth century, were progressively implemented in the sixteenth century, which also saw the first complete representation of the earth in a cartographic grid in Cosimo Rosselli's engraving of 1508. Martin Waldseemüller's *Cosmographiae introductio* issued in 1507 not only included information about America, but it also compiled a basic reference for the technical matters of geographic description. Important innovation for the accuracy of the locations of locales was the new methods of triangulation published by Peter Apian in his *Cosmographia* of 1513 and its later editions revised by Gemma Frisius, the two dominant authors in cosmographic matters for the sixteenth century. Later in the century, the most distinguished geographer and cosmographer was Egnazio Danti (1536–1586); he worked first for Cosimo II and later for Pope Gregory XIII. The privileged status obtained by cosmographic knowledge in the High Renaissance culture is perhaps epitomized best by the globes appearing in Hans Holbein's *The Ambassadors* (1533, National Gallery of Art, London) and the appearance of Ptolemy in Raphael's *Stanza della Segnatura*.

Cosmology in the Renaissance

Rienk Vermij

Department of the History of Science, University of Oklahoma, Norman, OK, USA

Abstract

The Renaissance views of the cosmos largely followed the medieval pattern. Only by the sixteenth century, some important innovations were proposed. These resulted from the increased application of mathematical methods. Whereas earlier ideas on the universe depended on metaphysical and religious

insights; astronomers increasingly discussed the constitution of the universe referring to empirical facts. Especially the work of Copernicus (1543) set the agenda for the early modern debates on the constitution of the universe. It is only in the course of these debates that a field of study arose that can be identified to modern cosmology.

Introduction

In their considerations on the universe, most people in the sixteenth century agreed on at least one thing: very soon, it would come to an end. The world, as people knew it, would be utterly destroyed and would have to make place for a new heaven and a new earth. And in a sense, they were right. The world as people had known it for centuries was quickly coming to an end, be it not factually but conceptually. New discoveries and new questions forced people to reconsider their ideas on the universe and in the end led to a completely new view of the world – arguably one of the most important conceptual shifts in human history.

The new cosmical views went beyond introducing new theories on the heavens or the stars but pertained to the field of “cosmology” as such. Strictly speaking, in the Middle Ages there was no such thing as cosmology. Of course, people contemplated the universe and at the universities, philosophers disputed certain questions that we can regard as cosmological. But the study of the cosmos could not be isolated from other topics. The structure of the universe was considered interesting because it told about creation, about the end of the world, and about the generation and corruption of things on earth. Much that was written on the cosmos actually pertained to man, the “little world” (microcosmos). The “harmony of the spheres” concerned both the cosmos and the musical theory. And many statements on the cosmos first of all expressed religious truths. It is questionable whether we could interpret them as mere sayings about the structure, order, or other properties of the *physical* universe.

The great innovation of the Renaissance in the study of the cosmos is not just the application of new tools and methods but also the way the field was detached from its philosophical meaning. However, this was a slow process. Only by the end of the Renaissance, the contours of modern cosmological thinking and an identifiable field of “cosmology” became dimly visible. A viable alternative for the traditional view of nature and the world emerged only around the middle of the seventeenth century. Speaking of the “cosmology” of the Renaissance, we should realize that it was something in full flux, and not a well-defined field. Rather, it was a chaotic debate in which many different positions were held on a variety of issues.

Heritage

During the Middle Ages, people were interested in the universe, but their main interest concerned theological and metaphysical aspects rather than physical properties. Actually, the various aspects were not kept distinct. Physical aspects were discussed because they were supposed to express some higher truth. Cosmological information was found as much in philosophical works, like Aristotle’s *De caelo*, pseudo-Aristotle’s *De mundo*, or Plato’s *Timaeus*, as in theological works like pseudo-Dionysius’ *On the celestial hierarchy* and, last but not least, the creation account in Genesis.

So, the “chain of being,” the hierarchical ordering of beings, was a philosophical principle which was supposed to be physically present in the creation. Also, several medieval philosophers (starting with Robert Grosseteste) wrote elaborate explanations on light, wherein light was taken both in a physical and a biblical sense. Light was a symbol of the divine essence as it unfolded itself in the creation, but as such, it also was a physical entity, fundamental for the way God governed the world. (And then, it also was the means by which humans could attain higher knowledge). Even purely physical discussions on the universe, as in commentaries on the works of Aristotle, concerned questions that were relevant foremost

from a theological point of view: the existence of a world soul, the cause of the motion of the celestial spheres, the finity/infinity of the world, etc.

Still, there was a basic agreement upon the physical outlook of the universe. Although there were many debates on points of detail, most scholars would agree on the following points. (1) The world was finite. (2) There was a fundamental distinction between the celestial and terrestrial regions, the celestial world (from the moon upward) being perfect and immutable, the terrestrial world (under the moon) imperfect and changing. (3) The celestial world consisted of crystalline spheres that carried the celestial bodies. Above this region was the place of God and the Elect. (4) The earth, on the contrary, was at rest in the center of the universe. Hell was often thought of as being at the center of the earth. (5) By its motion and light, and perhaps by more occult influences as well, the celestial world caused the various changes in the terrestrial world, such as meteors and the generation and passing away of animals, plants, minerals, etc.

It is important to realize that this was not a doctrine systematically explained. Information on the universe can be found, often piecemeal, in a variety of writings on spherics, natural philosophy, and theology. Some topics were the subject of elaborate speculations, others were largely disregarded. For instance, hardly any medieval scholar bothered to discuss the substance of the celestial spheres. Other relevant topics were discussed in a non-cosmological context. So, because Aristotle regarded the Milky Way as a sublunar phenomenon, medieval authors used to discuss this phenomenon in commentaries on Aristotle's *Meteorology*. Even though most of them would agree that the Milky Way actually had its place among the fixed stars, this insight simply did not make it into works on the heavens or on astronomy.

Innovation and Continuity in the Renaissance

The cosmology of the Renaissance for the most part continues the ideas and theories of the

preceding period. It is true that in the sixteenth century, several important new ideas were proposed and discoveries made. Still, they fully bore fruit only in the following period, when natural philosophy underwent a complete overhaul, and cosmology was set on a new footing by thinkers like Descartes and Newton. However, the contribution of Renaissance thinkers went further than just proposing new individual theories and facts. The new philosophy and the new cosmology of the seventeenth century did not just concern technical details but implied a new way of contemplating the heavens and the universe. The new views could become the focus of intellectual developments because the study of the cosmos had already become a main field of research.

Increasingly during the Renaissance, the cosmos, instead of being understood and studied mainly in symbolic and metaphysical terms, was looked upon as some other foreign continent that could be mapped and investigated by purely natural means. The various disparate questions were brought together and included into a more or less coherent area of physical study, from which other traditional questions, notably the theological elements that hitherto had dominated, came to be excluded. One can say that in this period the field of cosmology really came into being.

Obviously, the emergence of the study of the cosmos in physical terms was a slow and far from straightforward process. Ideas on the universe, like on other subjects, underwent the impact of the great intellectual shifts of the period. Three factors should be mentioned here. The first factor is the rise of humanist scholarship and the renewed study of classical texts. Philosophies like (neo-)Platonism, Pythagoreanism, and Stoicism became more widely known, gained new credibility, and thereby became serious competitors to the Aristotelian ideas (including ideas on the universe) still dominant at the universities.

The second factor is the renewed study of the Bible and the emphasis on a literal interpretation. The increased religious sensibility often disqualified Aristotelianism as pagan and opened the doors to other forms of philosophy that were regarded as more in line with Christianity. Indeed,

the various factors did not work in isolation but often influenced each other in complicated ways. On the other hand, biblical literalism was sometimes used to oppose new ideas, such as the motion of the earth. It could be a source of inspiration, but also a constraint.

A third factor is the growing prominence of mathematical methods in studying the world. This is directly relevant for our purpose, because astronomy was regarded as a field of mathematics. Astronomy, in particular spherics, had always been a source of elementary information on the physical outlook of the universe. But the contemplation of the universe was foremost a philosophical or theological affair. Astronomical theories served mainly practical purposes (the casting of horoscopes, the calculation of calendars, etc.) and were not really taken into account for philosophical questions. However, in the era of the Renaissance, mathematicians imposed themselves in an increasing number of fields and tried to put their discipline on a higher footing. In particular, astronomers claimed that their theories and observations were relevant for the understanding of the cosmos.

One should not exaggerate the innovativeness of these trends. Neither humanist scholars, nor theologians, nor mathematicians, were primarily concerned with cosmology in our sense. If they were interested in the cosmos, then it is because they still regarded the visible world as an expression of higher, metaphysical, or biblical truths. They might advance original ideas in metaphysics or theology but only rarely they contested the basic ideas on the physical constitution of the universe (Copernicus being the obvious exception). If in course of time their activities came to constitute a new approach to the cosmos and thereby a new field of cosmology, then that was without their intent, or even without their being aware of it.

Some examples of the three trends indicated above are given below. As to the rise of classical studies, in their ideas on the cosmos humanist scholars generally followed the medieval examples. In contemplating the universe, they were first of all interested in the religious and metaphysical dimensions. Physical positions were normally

inspired by these larger issues. If their descriptions of the cosmos entailed new elements, then it is only on points of detail.

The preponderance of a metaphysical outlook can well be seen in the neo-Platonism of Marsilio Ficino, one of the most important philosophers of the fifteenth century. Ficino regarded the cosmos as the unfolding of God's order. In his work *De sole* [On the sun], he gave a detailed description of the sun and its activity, but in a purely symbolical sense. He described the physical light of the sun, which at the same time was seen as an image of the Good, the Trinity, and the choirs of angels. Since the sun and the heavens were the image of God, they were a life-giving force. Ficino maintained the spiritual influence of the heavens in the terrestrial world.

In his commentary on Plato's *Timaeus*, Ficino discussed the harmonic order according to which God had created the world. This "harmony of the spheres" again was thought of as being present in the world in a very physical way. It was not just identified with the angelic choirs but with the speed and distances of the planets. Ficino even discussed the exact order of the planets, preferring Plato's order above Ptolemy's. He also discussed the exact tonal scale to which the celestial harmony answered. However, here too his description of the world serves a spiritual aim and is exclusively informed by a symbolic way of thinking. Although he regarded the order of the world in mathematical terms, Ficino did not try to describe the world in a quantitative-mathematical way.

Ficino and other neo-Platonist philosophers felt that their philosophies were better in line with the Biblical message than the dominant Aristotelianism. In this sense, they also represent the second tendency, the return to the sources of the Christian tradition and, in particular, the text of the Bible. This tendency most clearly manifests itself in the protestant Reformation. The Protestants, of course, were first of all moved by religious and theological considerations, but the principal place they gave to theology had its impact on their view of the universe as well. They felt that Aristotle's philosophy was too pagan in character and that a description and explanation of the universe should

be based on the Bible, in particular Genesis. In practice, however, they most often took their theories from some other philosophy. The direct application of Genesis to the explanation of the cosmos remained limited, but it did occur. Biblical texts that touched upon cosmological issues were for instance Genesis 1: 6–7, on the waters above the firmament, and 2 Corinthians 12: 2, wherein Paul speaks of being elevated to the “third heaven.” Increasingly, such texts were not just discussed in exegetical works but also in philosophical and astronomical treatises. The division of the heavens into three parts became quite common, both in academic and nonacademic texts.

A thorough overhaul of traditional cosmology in the name of Christianity can be found in the works of the sixteenth-century physician Paracelsus. Again, Paracelsus was not primarily interested in the world as such. To him, the world only made sense in the terms of Christian salvation. Rather than a division of the universe in a terrestrial and a celestial region in traditional terms, he saw the world as divided between a visible, material realm and a spiritual, invisible. This held true for both man and the universe. For a true understanding of the cosmos, knowledge of the invisible world is more important than of the visible world, as the visible world in the end obtains its true nature from the invisible. Paracelsus’ influence was considerable. For instance, Francis Bacon’s cosmological ideas clearly bear his impact.

By far, the most important trend is the third one, the growing influence of mathematics. Initially, the impact of mathematics on other fields was limited. However, the rise of mathematical methods did imply that increasing value was attached to factual and quantitative descriptions. This is best seen in the rise of “cosmography.” The *Cosmographia* of Petrus Apianus in particular became an extremely popular work. It combined basic geography and basic spherical astronomy, thus giving a description of both the terrestrial and celestial regions of the universe. From the sixteenth century onward, mathematicians increasingly came to challenge the arguments and the conclusions of traditional philosophers. This eventually would result in a

complete overturn of people’s views on the universe.

An early example of a mathematical description of the universe is the *Theoricae novae planetarum* by Georg Peurbach, first printed in 1472. Whereas earlier astronomical descriptions had a purely practical purpose, Peurbach’s work has an important theoretical component. In the line of Ptolemy’s *Planetary Hypotheses*, he described the universe as a whole of nested orbs. So, he regarded the spheres and epicycles that astronomers used to describe the motion of the planets as real entities, and he calculated their dimensions based on the assumption that there was no space left between them.

In 1543, Nicolaus Copernicus published his book *De revolutionibus orbium coelestium* [On the revolutions of the celestial orbs], wherein he proposed the revolutionary idea that not the heavens are turning around the earth, but that the heavens are standing still and the earth is turning on its axis; moreover, that the earth is not the center of the universe but has an annual motion in an orbit around the sun. His theory presented a decisive turning point in the history of cosmology, not because it was perfect or was immediately accepted (it was not) but because it started a general debate on the constitution of the universe that would go on for decades, if not centuries, and would lead to a general overhaul of natural philosophy.

Little is known about Copernicus’ motives to propose this momentous new idea, but from what he writes it is evident that he was partly motivated by a strong a priori conviction about the harmonious and divine character of the universe. He defended the axiom that all celestial motions were either regular circular motions or composed of such motions. Regular circular motions were regarded as an expression of divine perfection. Both Aristotle and Plato had therefore postulated that in the heavens, only regular circular motions could exist. This was a generally accepted idea, but it was violated in the astronomical hypotheses of Ptolemy. One of Copernicus’ main aims therefore was the construction of astronomical theories that were in line with cosmological demands. This ideal was more widely shared at the time and this

aspect of Copernicus' theories was quickly accepted by other scholars. (Some other astronomers, by the way, tried to obtain the same aim in another way, by reintroducing the homocentric spheres of Eudoxus.)

As to Copernicus' more fundamental, and also more controversial, claim that the earth is moving in an orbit around the sun, his main argument seems to be that in this way the harmonious proportions of the solar system and its various motions are best preserved. In Copernicus' heliocentric system, the period of the planets increases regularly with their distance from the center, whereas in the system of Ptolemy, Venus and Mercury present an anomaly. So, as in the work of other Renaissance authors on the universe, metaphysical considerations appear very much at the core of Copernicus' work. But these demands were not answered by symbolical or religious interpretations but by an exact mathematical description of the real world. In this way, Copernicus' work proved a true game-changer.

Other mathematicians too did not immediately abandon the quest for a divine or harmonious order in the world, but they increasingly demanded exact astronomical calculations. Johannes Kepler, arguable the most important early follower of Copernicus' theories, presents us with a similar approach of a metaphysical or even religious point of depart that should be answered by exact mathematical models. Kepler left no doubt about his true motivation in describing the universe. He saw the universe as an expression of the divine Mind. The divers parts of the universe were an image of the Trinity. By mathematics, he hoped to reveal the proportions according to which God had created the world. The key to the divine blueprint were the five Platonic solids. Kepler felt that the relative distances between the planetary spheres as well as the musical intervals could be derived from the proportions implied in the five Platonic solids. The divine harmony of the world, in which Kepler firmly believed, could be discovered by studying the empirical data.

So, the mathematical approach initially was not intended to replace the more metaphysical considerations. On the contrary, in so far

mathematics was used, it was in the service of establishing the harmonious relations that were required by a view of the universe as God's creation. The difference between the views of Paracelsus, on the one hand, and those of Copernicus and Kepler, on the other, is not that the latter were not interested in describing the universe in Biblical and religious terms, for they definitely were. It is rather that Paracelsus tried to achieve this aim without referring to mathematics, whereas to Copernicus and Kepler this was a main instrument. Both Copernicus and Kepler created a vision of the world determined by a mathematical order. What ultimately inspired them were metaphysical considerations, but their vision had to be in agreement with the empirical facts.

Developments After Copernicus

Copernicus' work had far reaching consequences. The geocentric cosmos was no longer self-evident. Astronomers had to make a choice between two very dissimilar alternatives. This gave the study of the cosmos a new urgency. Whereas up to that time, astronomers had largely relied on the work of classical authors, by now they felt the need to start from fresh observations. Mathematicians and astronomers increasingly set the debate on the universe on a new footing, not by speculations on the harmony of the spheres or the divine order (although, as stated, this element remained important) but, on the one hand, by demanding that all models of the universe should answer to the empirical data and, on the other, by collecting ever more, and more accurate, of such data. The interpretation of the universe in symbolic terms was not abandoned, but faded into the background.

An idea that was now quickly abandoned was the idea of fire as the upper element in the terrestrial world, forming a sphere of its own. The idea that fire was an element had been disputed earlier by philosophers. But in 1557, the French mathematician Jean Pena refuted the idea of a sphere of fire referring to astronomical observations: a sphere of fire should result in a notable atmospheric refraction. More generally, for studying

the world he defended the use of mathematical over philosophical considerations.

In particular, the Danish nobleman Tycho Brahe started a campaign of systematic astronomical observations, achieving an accuracy that far surpassed that of earlier observers. Especially relevant for the view of the cosmos were his parallax measurements. In 1572, Tycho observed a new star (a nova) that remained visible for several months. In a brilliant campaign, Tycho determined the parallax of this nova and found that it was above the moon, thus in the celestial region. This violated the traditional view that there was no change in the heavens. The technique was repeated, with similar outcome, with comets, first of all the big comet of 1577. Aristotelian philosophers had always maintained that comets were atmospheric phenomena, but astronomers now proved mathematically that they were celestial objects. The nature of comets and new stars (other novae were observed in 1600 and 1604) gave rise to much debate, without for the moment a consensus being reached.

Tycho also propagated a new model of the planetary system. Although very few people could swallow the motion of the Earth, other aspects of Copernicus' innovation were more readily accepted. That Venus and Mercury moved around the sun instead of the Earth, an idea already defended in late antiquity, made very good sense to many scholars. In the wake of Copernicus, astronomers wondered whether the same could hold for other planets as well. Tycho made the radical step of postulating that *all* the planets, except for the moon, moved around the sun. The whole system of sun and planets moved around the earth, which was still at rest in the center of the universe. In order to make his system physically plausible, Tycho had to abandon the solid spheres which carried the planets. In his view, the planets moved freely through space. By and large, the idea of solid planetary spheres would be abandoned by philosophers.

Tycho's system gained many adherents in the course of the following century, although seen from a traditional perspective, it made only limited sense. Tycho strove above all to maintain the

rest of the Earth, which was deemed important for reasons of physics, common sense, and, above all, biblical exegesis. But in order to achieve this goal and still do full justice to the astronomical data, he had to sideline the principle of divine order or harmony.

Most mathematicians were more cautious. Innovations were accepted only piecemeal and hesitantly. Still, the quest for the true constitution of the universe became a core business of astronomy. An interesting case is the cartographer Gerard Mercator, who represents many of the trends described above. Mercator stood in the tradition of writing cosmographies, but instead of writing short overviews, he aimed at a massive, multivolume work, his *Atlas*, describing all the parts of the visible universe. It remained unfinished, but in 1595, the first part was published, a description of the 6 days of creation. As a mathematician, Mercator was critical of philosophy and found fault with both Aristotle and Plato. He claimed that his description was founded on biblical principles, but, in practice, one finds many Stoic elements. He rejected heliocentrism, but he accepted the heliocentric orbits of Venus and Mercury. Referring to Genesis 1: 6–7, he felt that the planets are moving in some kind of water. He also felt that from this water, God had created the angels and the human souls.

Astronomy and mathematics were thus creating a new idea of the universe. The impact was felt in the field of philosophy as well. Philosophers increasingly felt the need to incorporate the new discoveries into their philosophical systems. Although they normally started from metaphysical principles, they had to take the empirical facts much more seriously than before. The physical constitution of the universe became an object of philosophical study in its own right.

A heroic attempt to bring the philosophical ideas on the universe in line with the new scientific discoveries was undertaken by the Italian philosopher Francesco Patrizi in his *Nova de universis philosophia* (1591). He remained a geocentrist, but he rejected the existence of solid planetary spheres and did not believe in a qualitative difference between the celestial and the terrestrial realm. Also, he believed that space is

infinite: the visible universe is at the center of an infinite space. Patrizi's case is interesting, because it demonstrates that it became increasingly difficult to accommodate the ancient symbolic interpretation of the world with the new mathematical demands. Patrizi was a neo-Platonist, very much influenced by Ficino, and like his predecessor, his aim was to describe the world in terms of cosmic harmony. However, he was much more interested in natural science than Ficino and tried to found his ideas on "divine prophecies, geometrical necessities, philosophical reason, and conclusive experiments." So, although convinced of the harmonious order of the world, he had trouble applying the concept of the harmony of the spheres, because he regarded music not in terms of abstract proportions but as a manifestation of physical sound. In the end his work proved a dead alley, mainly because he distrusted astronomical calculations and insisted on philosophical principles.

A philosopher whose ideas did have a certain impact was Giordano Bruno. His main contribution to the cosmological debate was his defense of the infinity of the universe. The idea was not completely new. Already in the fifteenth century, cardinal Nicholas of Kues (Cusanus) defended the view that the universe should be infinite, as it had been created by an infinite God. For the time being, he got few followers. Since the universe was believed to turn on its axis, Aristotle's argument that in an infinite universe the outer parts would have to move with infinite speed seemed invincible. However, in Copernicus' system, the heavens were at rest, so this argument no longer held water. The English mathematician Thomas Digges was the first to propose a sun-centered universe wherein the sphere of the fixed stars (which he identified as the heaven of the elect) extended itself infinitely upward.

Bruno however, in his dialogue *De l'infinito, universo e mondi*, went considerably further by maintaining that there is neither center nor boundaries in the universe. Space extends indefinitely into all directions. The universe is one, but it is full of an infinite number of stars. Each star is a sun like our own, each with its own planets similar to our Earth. Those planets are inhabited by rational

beings like us. Bruno was a philosopher, not an astronomer, and his arguments were metaphysical, not mathematical. Like Cusanus before him, he referred to God's infinite power. Still, he also referred to Copernicus' ideas. In a sense, he carried the new approach to its logical conclusion. His ideas would have considerable influence on the cosmological thinking of the seventeenth century.

Legacy

A decisive blow to the old world system came with the introduction of the telescope in 1608 and the subsequent discoveries by Galileo and others. The mountains and valleys discovered on the moon demonstrated that the moon was more of an earth-like body than conceived in traditional philosophy. This had been argued earlier on theoretical grounds, but the testimony of the telescope was harder to dismiss. Likewise, the discovery of sunspots gave fresh arguments to those who claimed that the heavens are not perfect, as even the seemingly perfect body of the sun showed spots. These discoveries made the division of the universe in a celestial and a terrestrial world pretty much untenable. The possibility that the celestial bodies were inhabited like the earth no longer seemed really far-fetched. In the following years, Copernicus' heliocentric ideas would slowly gain more adherents.

For a long time, there was no consensus on basic questions regarding the constitution of the universe, although some general trends can be discerned. As the counterreformation gained pace, religious authors generally felt the need to keep as much of traditional learning intact as they possibly could. Authors outside the universities felt lesser constraints and ventured many speculations about the constitution of the universe. Many came up with explanations drawn from analogies with existing terrestrial physics. Comets and new stars were no longer regarded as the results of terrestrial exhalations, as Aristotle had taught, but as the result of exhalations from the planets or the fixed stars. Many authors referred to the ideas of William Gilbert (1600), who had argued that the earth was a big magnet and that all the

other celestial bodies were likewise magnets. The magnetic force was a life-giving soul. For Copernicans, who could not refer to the motion of the heavens as the ultimate cause of change, this offered a new source of life and motion in the world. However, very few people doubted the crucial role of celestial influences (even though they became increasingly critical of astrological predictions).

The new discoveries were still interpreted in a religious framework. Apart from stars and planets, many authors discussed angels, the empyreum, prodigies, and the divine order. Some authors speculated that stars were “clarified” planets and that the earth too would return to a luminous state after the Day of Judgment. Similar ideas were still upheld in the work of Thomas Burnet of 1681–1689. However, these religious elements became less and less important in the cosmological debate. To establish the true constitution of the universe, in principle only mathematical or physical arguments were acceptable, although biblical arguments too for a long time would remain important (and to many even decisive). Mathematics became the foundation of a gradually evolving field, wherein people discussed each other’s results and methods. A body of standard questions was gradually put together, so that around 1600, one can indeed speak of a field of “cosmology.” (Academic teaching, however, was lagging behind. Here, the new questions only became leading in the second half of the seventeenth century.) The metaphysical dimensions that had been crucial in the earlier debates were relegated to the sidelines and became the domain of purely personal speculation. The results of Copernicus or Kepler could be used by people who had no patience with their metaphysical inspiration.

However, metaphysics and religion were still what mattered most to most people in their understanding of the world. A new standard view of the universe therefore could not arise until some form of consensus had been reached on these very issues. It is only with Descartes and Newton that the mathematical view of the world obtained a solid religious and metaphysical underpinning and thereby could become the core of an integrated view of the cosmos.

Council of Ferrara, Florence, and Basel

Federico Barbierato
University of Verona, Verona, Italy

Abstract

Convened by Pope Martin V, the council opened on 23 July 1431 in Basel, where the first 25 sessions took place until 7 May

1437. Fearful of the conciliarist turn that was emerging, the new Pope Eugene IV decided to move it to a nearer and more controllable area. On 18 September 1437, the new phase of the council thus opened in Ferrara, while the conciliarists who remained in Basel declared Eugene IV decayed and elected in his place, as anti-pope, the Duke of Savoy Amadeus VIII under the name of Felix V (who would spontaneously put down the tiara only in 1449). The council remained in Ferrara until 1 January 1438. From there – partly because of an epidemic that struck Ferrara – it was transferred to Florence on 16 January 1439. The last phase of the council was held in Rome from 25 April 1442. The first goal of the Council consisted of the unification between the Latin and Orthodox Churches. The results of the council were not ratified: pressures from the Byzantine communities and a general hostility from the anti-Latin front led many of the countersigners of the unionist pact to retract. The emperor did not ratify the agreement, and only his successor, Constantine XI, promulgated it in 1452. A few months later, Constantinople fell into the hands of the Ottomans. In 1472, a synod held in Constantinople rejected the union of Churches.

History and Original Aspects

Convened by Pope Martin V, the council opened on 23 July 1431 in Basel, where the first 25 sessions took place until 7 May 1437. Fearful of the conciliarist turn that was emerging, the new Pope Eugene IV decided to move it to a nearer and more controllable area. On 18 September 1437, the new phase of the council thus opened in Ferrara, while the conciliarists who remained in Basel declared Eugene IV decayed and elected in his place, as anti-pope, the Duke of Savoy Amadeus VIII under the name of Felix V (who would spontaneously put down the tiara only in 1449). The council remained in Ferrara until 1 January 1438. From there – partly because of an epidemic that struck Ferrara – it was transferred

to Florence on 16 January 1439. The last phase of the council was held in Rome from 25 April 1442.

Although the issues addressed were manifold, the crux consisted of the relations between the Latin and Orthodox Churches. The schism of 1054 had not been repaired, and, at that time, political and strategic needs were pressing. The growing Ottoman pressure on the Byzantine Empire pushed Emperor John VIII Palaeologus to be part of the Byzantine delegation: it was appropriate to reach an agreement also in view of military aid. The difficulty of finding a balance between the parties continued throughout the council, possibly emphasized by the role played within the Latin Church by theologians, especially Dominican. Theological issues were therefore placed in the foreground, at the expense of the episcopal component. Work concerned almost completely doctrinal aspects and thickened around the problems of the *filioque* formulation (the Catholic doctrine that the Holy Spirit proceeds from both the Father and the Son, and not, as did the Greeks, from the Father through the Son), the claimed supremacy of the bishop of Rome, the use of unleavened bread in the Eucharist, and the existence of purgatory. These were the issues that had led to the schism and that had to be fixed back together, albeit in an environment characterized by cultural differences and a certain mutual distrust, fuelled by two different approaches: the biblical-patristic one of the Greeks and the scholastic-dialectical of the Latin. All further complicated by the need to arrive at a unified formula that would solemnly sanction the union and that would represent therefore a highly sensitive decree of faith.

The most tangible result of the council was the bull *Laetentur Caeli*, issued by Eugene IV on 6 July 1439. It was an arrangement of the main issues already mentioned (the procession of the Spirit, Purgatory and the papal authority, Eucharistic bread): the need to find a unified formulation did not lead to innovations on the theological level, but rather to an overlapping of previous positions. To tell the truth, within a text that sought a narrow dogmatic definition, the question of bread was resolved in pluralistic terms by arguing that each priest could consecrate

the Body of God in one form or another, according to the rule of the Church to which they belonged. However, this was an exception. The question of the *filioque* was resolved by affirming mutual “understanding” of the two Churches and the unified position: there was “one and identical sense of truth, with the same aim and significance”; thus the Latin formula “and the Son” and Greek “through the Son” were declared equivalent. In fact the Holy Spirit “proceeds eternally from both as from one principle and through one blow”: the two different formulas used in the past by the Churches would then agree on this, albeit in different ways, for mere purposes of clarity. Therefore the *filioque* expression was accepted “lawfully and reasonably... to clarify the truth.”

The theme of the limits of papal authority was solved reaffirming the supremacy of the pope “on the whole universe” as an object of faith. In this framework, the hierarchy of the patriarchs was confirmed: immediately after the pope came the Patriarch of Constantinople, then in order those of Alexandria, Antioch, and Jerusalem. Similarly the existence of Purgatory and its characteristics were confirmed.

The results of the council were not ratified: pressures from the Byzantine communities and a general hostility from the anti-Latin front led many of the countersigners of the unionist pact to retract. The emperor did not ratify the agreement, and only his successor, Constantine XI, promulgated it in 1452. A few months later, Constantinople fell into the hands of the Ottomans. In 1472 a synod held in Constantinople rejected the union of Churches.

Council of Trent

Federico Barbierato

University of Verona, Verona, Italy

Abstract

The Council of Trent (1545–1563) was one of the major turning points in the internal reform of the Church of Rome and in the organization of a structured response, in terms of protection and closure, against the reformed movements. The conciliar decrees not only marked the theological, ecclesiological, and institutional structure of the Church for centuries to come, they were also crucial in giving the lives of Catholics a new shape and frame. The Council of Trent represented the defeat of any prospect of reconciliation with the Protestant front and the beginning of a wider program of intervention in the daily life of the faithful. Theologically, the Church of Rome came out of the Council with a strengthened confessional identity. The road to the Counter-Reformation was thus marked.

History and Original Aspects

The Council of Trent was one of the major turning points in the internal reform of the Church of Rome and in the organization of a structured response, in terms of protection and closure, against the reformed movements. The conciliar decrees not only marked the theological, ecclesiological, and institutional structure of the Church for centuries to come, they were also crucial in giving the lives of Catholics a new shape and frame.

The request for the convening of a council was deeply felt within the Church since the closing of the Fifth Lateran Council. Luther himself repeatedly appealed to the convening since as early as 1518. This position gradually gained both a popular consensus and support at the Imperial Diet. Even Charles V saw the Council as a good

opportunity to put an end to the internal strife and to concentrate forces against the Turks.

After several postponements, the Council convened by Pope Paul III opened in Trent in December 1545. The choice of the city – which caused many logistical problems in hospitality, supplies, and availability of adequate libraries for theological discussions – was not neutral: a town at the edge of the Empire, it evoked in the pope fears of a Protestant presence difficult to control. After all proceedings were immediately put at risk by the difficult debate on the bishops' obligation of residence in their diocese, on imperial drive, in fact, it was decided that the dogmatic issues were to be discussed together with the disciplinary ones. In addition to a preaching ban on alms collectors, the sessions thus decided even on hot-button issues such as the original sin and justification, by rejecting Lutheran interpretations and establishing that baptism amended the sin, while a predisposition to sin, called lust, remained in the baptized. Nevertheless, baptism allowed the achievement of a "state of grace" that affected the tendency to commit meritorious deeds. The latter, despite being a consequence of grace, were nonetheless deemed necessary to salvation. The state of grace could be achieved only through absolute trust in God: it was therefore a state that was to be deserved by faith and acts and would lead to earn the infusion of the Holy Spirit, in any case possible only after baptism. The doctrine of predestination was thus completely rejected in favor of an emphasis on the human freedom to decide one's own destiny. Catholic positions were also reiterated in the decision to restate completely the validity *ex opere operato* of the seven sacraments, deemed as instituted directly by Christ, and in the denial of the free examination of the Scriptures (whose canonical form was identified in the Vulgate), the interpretation of which it was a matter for the Church.

The international scene, however, was rather confused: the Schmalkaldic War began in July 1546, and the defeat of the Protestant princes would lead to the proclamation of the Augsburg Interim in 1548. In the meantime, the outbreak of an epidemic in Trent had offered the pope – after eight sessions – the opportunity to move the

council to Bologna where, although crippled of a meaningful portion of representatives, two sessions were held.

With the death of Paul III in November 1549, the first phase of the Council ended. His successor, Julius III, summoned it again in Trent in May 1551. On the basis of decisions already taken in Bologna, it issued a series of decrees related to the Eucharist, Penance, and Extreme Unction. Representatives of the Protestant states had been invited to attend by the Emperor and presented orally their demands, which included the cancellation of all previous decrees. Hopes of reconciliation therefore fell through immediately: the Council was suspended at the end of April 1552 because of the rampaging of the Princes' Revolution led by Maurice of Saxony.

The Council was reopened by Pius IV only in January 1562: pressures to the reconvening came this time from France, where the Reformation was gaining ground. The context had definitely changed, and expectations of reconciliation were now mostly extinguished. The publication of the *Index librorum prohibitorum* in 1559 and a number of moves against the possibility of a dialogue had marked almost symbolically a shift in the Council's agenda: the defense strategy was to be deployed now, without any doctrinal and dogmatic concession. The reality of the sacrifice of the Mass and the real presence of the body and blood of Christ in the Eucharist were reaffirmed, as was the validity of the ecclesiastical hierarchy as established by Christ: at its head were the pope, successor of Peter, and the bishops, successors of the apostles. The doctrine of Purgatory was repeated, as well as the devotional matters: saints, relics, and sacred images could and should be venerated. These decisions were accompanied by a series of decrees that were intended to create a more rigid control grid on the lives of the faithful. It was obviously necessary to pay attention to the formation of the clergy, which should be formed in diocesan seminaries. This was necessary because the clergy became guide, guardian, and companion of the whole life of the Christian, marked by precise rituals. The necessity of baptism was reiterated, and it was prescribed that priests compiled a dedicated register. The same

was to happen for christenings, weddings, and burials. Precisely in the case of marriage, the change of pace became evident: its sacramental nature was reaffirmed and so was its indissolubility: the rules for the cancellation were fixed in canon terms, and, in parallel, to mark even more the two ways of the service of God, the tradition of clerical celibacy was made totally binding. The bishops were supposed to monitor the implementation of the decrees by carrying out an annual pastoral visit to the parishes. The drafting of a new *Index librorum prohibitorum* to be issued in 1564 and the revision of the Catechism and the Missal were delegated to the Pope, who in turn ratified all decrees with the bull *Benedictus Deus* of 30 June 1564.

The Council of Trent represented the defeat of any prospect of reconciliation with the Protestant front and the beginning of a wider program of intervention in the daily life of the faithful. Theologically, the Church of Rome came out of the Council with a strengthened confessional identity. The road to the Counter-Reformation was thus marked.

Counter-Reformation

Federico Barbierato
University of Verona, Verona, Italy

Abstract

The term Counter-Reformation was used for the first time at the end of the eighteenth century to indicate the process of

re-catholicizing territories put in place by the Church of Rome against the Protestant threat. Since then, the concept of Counter-Reformation has long been at the center of occasionally rather harsh historiographical debates, whose sides have sometimes been defined by creed. A purely oppositional idea of the Counter-Reformation, understood as the opposite reaction to the Reformation, has been supplemented by a broader vision: this tends to emphasize that, since the Middle Ages, attempts were made, within the Church of Rome, to reform and thus meet the demands of a considerable part of the clergy and of the faithful. This historiographical orientation has subsequently preferred to adopt the concept of “Catholic Reformation,” thus emphasizing the propositive plan of internal reform of the Church rather than on the oppositional reaction to the Reformation.

Heritage and Rupture with the Tradition

The term Counter-Reformation was used for the first time at the end of the eighteenth century to indicate the process of re-catholicizing territories put in place by the Church of Rome against the Protestant threat. Since then the concept of Counter-Reformation has long been at the center of occasionally rather harsh historiographical debates, whose sides have sometimes been defined by creed. A purely oppositional idea of the Counter-Reformation, understood as the opposite reaction to the Reformation, has been supplemented by a broader vision: this tends to emphasize that, since the Middle Ages, attempts were made, within the Church of Rome, to reform and thus meet the demands of a considerable part of the clergy and of the faithful. This historiographical orientation has subsequently preferred to adopt the concept of “Catholic Reformation,” thus emphasizing the propositive plan of internal reform of the Church rather than on the oppositional reaction to the Reformation.

Historiography is fairly unanimous today in acknowledging the need to go beyond the

definitions – hence the partial abandonment of the label “Catholic Reformation” – in favor of a deeper understanding of a complex historical period, in which needs for reform intertwined with an extreme perception of danger, leading to openings perhaps more limited than closures.

We can thus define the Counter-Reformation as a fairly long period in which the Church of Rome promoted a process of change – and sometimes profound transformation – which brought more significant outcomes on the Italian territory than elsewhere. The results were evident on the level of religious life, culture, and society and were achieved via the control on the various forms of religious dissent exerted by new institutions or by the strengthening of existing ones.

However, the widespread desire for a reform of the Church had deepened during the Middle Ages as a response to the dissatisfaction toward the organization and the behavior of the clergy, the scandals involving the Curia, the economic demands of the Church, and so on. Expectations and plans for reform had thus clustered in large movements of uncertain boundaries, as the *Devotio moderna*, Erasmian evangelism, and Gerson’s theology of piety, often involving religious orders in a reflection on the need to return to a form of original purity. Attempts in these directions at some councils (as in Constance, Basel, and at the Fifth Lateran) did not lead to lasting effects. It was the Council of Trent that definitively signalled the overlap between the two trends, toward internal reform and a reaction against an enemy, with whom it now appeared impossible to come to any settlement. Trent, in other words, made sure that the Church of Rome, in its almost systematic refusal of the Protestant doctrine, would define in this way a unified and stable doctrine, proposed in a series of decrees that would play a key role in shaping the faith of Catholics in the following centuries.

The first obvious process was the final centralization of religious power in the figure of the Pope and the cardinals’ court. The figure of the “Sovereign Pontiff,” in its dual nature as a state sovereign and spiritual and religious leader, was finally recognized as the summit of the

Church, and any conciliarist ambition was wiped out. The city of Rome became the stage on which to represent the prestige of the papal monarchy through art, architecture, and literature. From Rome the activities of the key players of the Counter-Reformation radiated, in a renewed role of congregations – risen in the early part of the sixteenth century as restricted and temporary committees – which, once stabilized, were assuming an enormous power over the political and ecclesiastical policy arena. Among them the congregation of the Holy Office took over a role of particular importance – even at a symbolic level – as well as, at a different and lesser degree, that of the Index. The Holy Office (created in 1542) formed the “armed wing” of the Church in the defense of orthodoxy and ecclesiastical authority and probably remains the symbol of a period and of an ideology of control. In the new configuration of the Roman power, the Inquisition became the first element of a centralized bureaucratic structure of repression, despite the particularities of individual peripheral tribunals, which were subject to some sort of negotiation with the governments of their hosting States.

In a context in which the ecclesiastical policy was passing more and more through the instruments and channels of international politics, a key role was played by papal nuncios, guarantors of a communication, and transmission network between center and periphery with very broad jurisdiction: to diplomatic activities as ambassadors, they flanked authority within the pastoral government, the relationships with the local ecclesiastical authorities, also arriving in many cases at the fight against heresy.

Such centralization came somehow in conflict, in terms of institutions, with the figure of the bishops, to whom the Council of Trent had in effect entrusted – as the highest representatives of local churches – a central role in ecclesiastical reform. Thus the Counter-Reformation, at institutional level, witnessed a rather marked tension between the needs of the Roman centralism, local churches with their bishops, and the role of regular orders. Although the dimensions of the conflict varied significantly according to the periods, it represented a sort of constant in an

attempt to apply Trent decrees and the overall Counter-Reformation strategy.

In fact it should be noted that the Counter-Reformation constituted not only a moment of dogmatic definition and institutional, theological, and church stabilization: it was a much more far-reaching process, which aimed at a much broader and more systematic control on individuals via a complex system of prohibitions on one side and propaganda on the other. It was not only a matter of prohibiting behavior, reading, or discourses: inquisitors and, to a different degree, bishops could and should deal in various capacities with all this. It was also a matter of educating faithful that were still considered “children.” Here the new religious orders, instituted and grown in the atmosphere of the Counter-Reformation, intervened. Subject to heavy attacks in the first half of the century – from both Reformed and Catholics – religious orders had to face Luther’s radical criticism, which had denied the legitimacy of their setting up a special body within the Christian community. However, the anxiety that was common within monasteries resulted in a widespread feeling of unease even among friars and monks, who often during the sixteenth century featured among the main vehicles of heterodox ideas. Nevertheless, the structure of the regular orders was perfectly functional to the centralizing project of the Counter-Reformation Church, and therefore their privileges were safeguarded and strengthened, at the expense of the bishops’ jurisdiction. The orders therefore represented on the one hand a deep wedge in bishopric authority and on the other a fundamental tool in the care of souls and in the preaching and education of the faithful.

Among the many orders generated within the Counter-Reformation, a distinguished role was played by the Jesuits, who were the protagonists of an impressive work of “acculturation,” by modulating communication in a strikingly modern way. On the one hand, they addressed European elites, by supporting the teaching in colleges and universities with more individualized work, exercised through a direct relationship with princes and noblemen of whom they became confessors and spiritual directors. On the other

they manifested a clear awareness of the need to undertake a missionary conquest not only in territories to be evangelized but also in the neighboring lands to re-evangelize, the “Indies over here.” If in the true Indies missionaries – mostly Jesuits – had been facing an otherness after all expected, in most territories near the center of Christianity, including Italy, they found places of very limited evangelization, packed with “superstitions,” “idolatries,” and “popular” beliefs and often completely impervious to theological questions. In other words, missionaries and preachers attempted to exercise control on the “lived religion” of the masses by putting in place more education action. An attempt, however, destined to a rather obvious failure, remarked with growing forbearance by preachers and bishops, who faced a sort of “primitive religion,” often insensitive to the language of a faith perceived as distant. Confronted with a similar situation, it was necessary to develop tools of persuasion that took the public into account. Missions took on an increasingly theatrical, scenographic connotation, accompanied by music and capable of stirring consciousness. Masses, sometimes imposing, of individuals therefore gathered to hear sermons and participate in such missionary meetings. Impressed and awed, definitely shaken, thus the faithful took part in processions in which they became themselves actors of a ritual of edification and forgiveness, which ended with mass communions. In parallel the secular and regular clergy established schools of Christian doctrine, in which the faithful were to find the key elements to be educated in the faith. However, it was an education whose perspective was totally hostile to achieving a conscious faith and proceeded through a learning process based on the memorization of concepts and prayers. This process excluded a direct relationship with the sacred text for large sections of the population, since the reading of the Bible in the vernacular, already subject to bans, had been permanently prohibited with the Index of 1596. The result was a type of devotion mostly based on external practices, on collective rituals, and on remembering prayers and Latin formulas whose meaning remained unknown to the large majority of Catholics.

Even practices defined as idolatrous were channelled to more controllable devotions that could embody in objects, like saints, the Virgin, or the sacred heart of Jesus.

In a similar effort of acculturation, all the means of expression were mobilized. With the simple folk, different tools had to be used than mere censorship and prohibition. Thus images, for instance, became functional to the creation of the Counter-Reformation faithful: although the represented subjects had engaged the senses of the onlookers, the sensuality had to be addressed first and foremost to communicate the suffering endured by the saints, Christ, and the Virgin. Bodies to identify with because they had been subject to the same afflictions everyone may experience. What could be outrageous was hidden, hence the focus on nudities, thoroughly covered. The result was a new concept of "obscurity," which was unprecedented and must have significantly surprised a substantial segment of the population, which witnessed the conviction of performances and, as will be seen, behavior deemed hitherto entirely lawful.

Censorship then integrated into a propaganda operation of ample proportions, which ended up giving the tone for an entire culture: literary, scientific, artistic, and social life came under a veneer of at least external conformism under which, however, some widespread elements of rebellion did not stop harboring. If, for example, the sentence of Galileo Galilei in 1633 certainly represented one of the high points in the affirmation of the cultural model of the Church of the Counter-Reformation, it was nevertheless true that Galileo's disciples continued to develop, albeit discreetly, the lesson of their teacher. From this point of view, inquisitorial archives provide evidence of a stubborn resistance on the part of large sections of the population: the illegal circulation of prohibited books, for example, formed a characteristic feature of the world of the Counter-Reformation. And, on the other hand, the structure of control and repression was itself weakening: censoring institutions increasingly realized the impracticability of a model that, moreover, a growing number of individuals found flawed. Contradictions were

present within the Church, whose members were increasingly engaging in a difficult balance between conformity and the necessary openings toward Europe that, especially since the second half of the seventeenth century, was traversed by concerns that made sectarian fractures, in the end, a secondary problem. The challenge that was opening was the "crisis of the European conscience" and not so much a different interpretation of the faith, as its negation became the enemy, especially on the doctrinal level.

The territory, mainly Italian, on which ecclesiastical authorities exercised stronger control, became, therefore, a context in which cultural production suffered in a particular way, but in which a kind of outward commitment to the principles of the Counter-Reformation also developed. This externality – which was to reassure the authorities – found expression in a deep split between the external manifestation and real beliefs.

In this ambiguity – which obviously did not escape the attention of the ecclesiastical hierarchies – the army of confessors had to intervene. To them, the difficult task of harmonizing consciences and behavior was entrusted, to link the internal and external forum. Starting from 1559 they were obliged to refuse absolution to those who confessed in the internal forum of having sinned or being aware of crimes within the Inquisition's jurisdiction. Only after formally deposing in front of the inquisitor, the penitent would be welcomed by the confessor for absolution. Conscience, therefore, was not only washed in the internal forum but had to find a justification in the external one. Also, the role of the confessor increasingly likened a spiritual guide that should not be content to grant or deny absolution but had to direct the weak minds of penitents to salvation. The role of the Jesuits in this respect, as already mentioned, was of primary importance, especially among European elites.

Nevertheless, confessors and pastors in general were charged with the daily business of contact with the faithful, which were not only faced with the need to change their way of believing and often the objects of this belief but also their behavior. On the basis of Trent decrees, the life

of the faithful was to take place within a rather rigid grid of sacraments and rituals. These were going to affect in particular the major moments of transition in the lives of individuals, by marking them with rites in which the Church was to be the first reference. The reaffirmed confidence in the Seven Sacraments as essential for salvation had led to an increase in their importance also at the ritual level. Some established social practices had to be bent and lifted, ancient rites to be replaced by new ones. The restrictions applied in the selection and number of godfathers, for example, were an element of conflict as baptism traditionally constituted an opportunity to forge alliances and establish relationships. However, at a more symbolic level, the Church also intervened to break up the continuity between the world of the living and of the dead ensured by an ancient ritual system, which preserved the long relationship between the earthly world and the hereafter even after death. To intervene in this area meant to provoke a cultural trauma of ample proportions, and, in fact, many of these rituals largely survived the attempts of change brought by missionaries and the secular clergy. Similarly, pre-Tridentine rituals related to marriage continued to be practiced long after: until the Council a marriage was considered valid as long as the consent to enter into marriage was audibly exchanged, with the assent of the two families. Marriage “promises” were considered binding, and even sexual acts performed within a couple, who would only afterward join in marriage, were deemed acceptable. The Council, reiterating the sacramental nature of marriage, changed this state of affairs and consequently intervened on sexual mores, condemning any act performed outside the marriage bond, which was to be considered valid only if celebrated in front of the parish priest and two or three witnesses and after that the priest himself had given repeatedly announcement to the community for three successive holidays. “Secularism” of marriage was thus lost in favor of the further clericalization of society and extension of the Church in the context of sexual “troubles,” which had traditionally been the responsibility of civil authorities. It was not so much – or not only – question of a judicial application of decrees, rather of a new

morality that, through multiple channels, was to constitute a new concept of family and role for women. The scapegoating of sexuality also occurred in confessionals, a sort of small private courts within which priests were called to inquire about the sexual life of penitents, trying somehow to regulate it. Doctrinal heresy was no longer the Church’s main worry. From the second half of the sixteenth century, this could be regarded as settled on the geopolitical level. It was within the borders of Catholicism that now it was question of operating in depth, extirpating the most obvious forms of what remained of heresy, of course, but mostly aiming at crashing “inorderly” beliefs and behaviors, disciplining them and creating a new theology of obedience.

Court Philosophy, Renaissance

Abstract

This entry explores the connection between philosophy and Renaissance court culture and the relevance of a philosophical education for those who aspired to become part of the courtly milieu. Humanists were often employed in different roles at court, their philosophical background making them perfectly fit to hold sensitive and relevant positions within the courtly establishment. The connection between philosophy and the court became stronger over the course of the Renaissance, resulting in philosophy being taken out of its traditional university milieu, and creating a complex dynamics: on the one hand, philosophers became subject to the will of the lords of the court, but on the other hand they could also profit from a larger degree of intellectual freedom that allowed them to investigate potentially troublesome topics that may have been considered unacceptable within universities. The most relevant depiction of the connection between philosophy and court culture can be found in the fourth book of Baldassare Castiglione's *Book of the Courtier*, which is devoted to an explanation of the Neo-Platonic notion of love and of its importance for the art of courtliness.

Heritage and Rupture with the Tradition

Philosophy played an important role in the culture of the courts of the Renaissance, and a philosophical background was often part of the education required for a member of the courtly elites, especially for those courtiers who aspired to relevant positions at court.

By the time courts and court culture were flourishing in all of Europe, humanism had become an established educational tradition. Humanists rediscovered previously neglected ancient philosophical texts, edited and translated them, and proposed a reform of traditional philosophical education and of other educational traditions as well, such as medicine, law, and logic (Hankins 2007). Humanistic education would play a pivotal role in the culture of the Renaissance courts. The influence of humanists and of the culture that they promoted coexisted with the persistence of scholastic philosophy in the universities. Yet, Humanists, in virtue of the allegiance that they often established with the courts and their culture, were also responsible for taking philosophy outside of the universities.

Innovative and Original Aspects

Humanists often held relevant jobs at court. Their extensive education rendered them perfectly fitted for employment as chancellors and as secretaries in the courts. Princely and papal courts alike were in need of a staff trained in tasks such as composing letters, drafting speeches, copying important documents, and in general of taking appropriate care of the numerous and different papers that were essential to the politics and to the administration of the court. Petrarch (Francesco Petrarca), usually credited as the “father” of humanism, was occasionally employed by his patrons, the lords of Milan and of Padua, as a secretary and as an orator. Courtly establishments that featured humanists among their ranks included the courts of Milan, of Naples, and the papal curia. Italian humanists also held offices in foreign courts (Schmitt et al. 1988, 116–18). The most famous example of a humanist employed at a Renaissance

court is probably that of the Sienese Enea Silvio Piccolomini (who was later to become pope under the name of Pius II). Piccolomini entered the imperial court in Vienna in 1442, where he took up the role of secretary in the imperial chancellery, and in the following years went on to serve as an ambassador as well. The writings that Piccolomini composed during his years at the imperial court, however, show that he aspired to something more than the position of secretary, desiring instead for himself the role of princely counselor. Such a goal was shared by other humanistically educated intellectuals, who often aspired to become princely advisors at court (Black 2007).

The association between humanism and courts became stronger during the second half of the fifteenth century. In this period, humanists were for the most part no longer active politicians, mainly interested in moral philosophy, but were instead teachers, professional philosophers who were not engaged in political activity, and, most importantly, courtiers, whose career and finances depended entirely on the support of their lord.

The association of humanism and courtliness also had an effect on the traditional relationship between philosophy and theology. According to James Hankins, in medieval schools philosophy had been humbled by its subjection to theology, which was regarded as the most important discipline. The new allegiance with courtliness resulted, in Hankins's opinion, in philosophy having to learn the good manners of courtiers and princes, that is to say, in elegance and urbanity becoming more important than originality of thought (Hankins 2007).

At the same time, however, the connection of philosophy with court culture also meant a larger degree of freedom for philosophical enquiry and for new philosophical approaches if compared with what happened in the universities. Philosophers employed at court could afford to be less concerned with the protocols, the academic requirements, and the traditions that were so relevant within the universities. Instead, a philosopher working at court had to respond only to his prince's desires. This aspect, of course, made the court philosopher dependent on his prince's generosity and therefore potentially subjected to

upheavals of fortune. Yet, the dependence on the will of the prince also meant that heterodox views were better received and overall safer at court than in the universities. This explains why many philosophers – just like poets, artists, or musicians – sought patronage at court during the course of the fifteenth and sixteenth centuries (Copenhaver and Schmitt 1992, 12–13, 53,).

Thanks to this alliance between philosophy and court culture, Renaissance courts became important places for philosophical debate. Such debates were especially concerned with the most noteworthy philosophical current within Renaissance court culture: Neoplatonism. In particular, Marsilio Ficino's version of Platonic love, which combined Platonism with the tradition of courtly love and made it appealing to the learned elites, became extremely popular in Renaissance courts (Celenza 2007).

Impact and Legacy

The importance of Neoplatonic philosophy and specifically of its conception of love within the culture of the Renaissance courts is testified to by one of the most influential texts of the period, Baldassare Castiglione's *Book of the Courtier* (1528). It was this work which defined the figure of the courtier and the art of courtliness throughout Renaissance Europe: the presence of an exploration of Neoplatonic love in its pages illustrates how relevant such a philosophical concept was for Renaissance court culture.

Divided into four books and set at the court of Urbino, the *Book of the Courtier* features speakers who investigate and discuss among each other the principal attributes that the ideal courtier and court lady should possess. The main quality that such a perfect courtier should possess is defined as *sprezzatura*. Roughly translatable as “nonchalance,” this term conveys the notion that the courtier should prove himself able to accomplish all the different and complex activities (ranging from military tasks to sports, from erudite conversation to dancing) that characterized the daily life of the courtly elites of the Renaissance, while giving an impression of effortless and naturalness,

almost of careless disdain. Although apparently a mere matter of style, *sprezzatura* shows instead the legacy of philosophical notions within court culture, since the concept finds its origins in the portraits of the perfect citizen that one can find in the moral philosophical teachings of Aristotle and of Cicero (Black 2007).

Castiglione did not possess an extensive philosophical background, having not received an education in philosophy such as the one provided in universities. Nevertheless, he had a good knowledge of contemporary philosophical trends, such as Neoplatonism and Aristotelian moral philosophy. In Hankins's opinion, Castiglione's lack of formal training in philosophy prevented him from becoming a partisan of any specific doctrine. His references to philosophy in the *Book of the Courtier* are not aimed at defending any particular philosophic school against another. Instead, philosophy becomes a language of reference to be used in the project of sketching the picture of the perfect courtier (Hankins 2002).

The last part of the *Book of the Courtier* is devoted to an exposition of Neoplatonic love presented by Pietro Bembo, one of the most celebrated Petrarchan poets of the Renaissance and the author of *Gli Asolani*, a dialogue on the nature of love. Bembo's speech, which describes the courtier as lover in a manner reminiscent of Plato's *Symposium*, can be credited with popularizing Platonic philosophy throughout Europe (Black 2007).

Bembo's speech is provoked by a contradiction: the previous speakers have asserted that the ideal courtier should be old enough to serve as a wise advisor to his prince. Yet, such an ideal courtier should not limit himself to being the perfect advisor. He also needs to embody the figure of the perfect lover. The problem that arises is how could the courtier also be an ideal lover, since it is generally believed that the best lovers are the young. Bembo then proceeds to solve the contradiction by defining the nature of love. Referring to notions expressed by Florentine Neoplatonists, Bembo defines love as a desire for Beauty. The perfect lover, however, must not limit himself to corporeal beauty, but be able to go beyond it and reach the contemplation of

transcendental beauty, which is a radiation from God. Young men are the ones who tend to limit themselves to the contemplation of corporeal beauty, while older and wiser men, such as the ideal courtier whose portrait has been sketched in the dialogue, have the necessary knowledge to reach transcendental beauty and God with it. The dialogue ends precisely on this notion of transcendental beauty.

Yet, also the previous part of the fourth book needs to be taken into account in order to explore the influence of philosophical notions over the systematization of courtliness. The first half of the fourth book – generally interpreted as Aristotelian, while the second part is considered Platonic – sees the main speaker, the Genoese gentleman Ottaviano Fregoso, describing the ultimate purpose of courtliness. Courtly arts such as dancing, jousting, and conversing, far from being only trivial occupations, are here defined as ways to conquer the prince with the ultimate goal of teaching him virtue and turning him into the philosopher-ruler advocated by Plato (Hankins 2002). It is precisely this recourse to Neoplatonic philosophy that, in Castiglione's intentions, redeems courtliness from any accusations of triviality. The figure of the courtier is transformed from a potential flatterer engaged only in vain and futile activities into a respectable philosopher and advisor, thus providing the art of courtliness with a higher, virtuous purpose.

Abstract

The transformations of the Renaissance involved a gradual but irreversible passage from a theocratic society to a more secular society that deftly harmonized respect for the teachings of the Christian Church with an appreciation of emerging secular philosophies and practices that, without apology, paid homage to the human manifestations of God's divinity. While medieval courtesy standards were built around the duty to God and the monarch, Renaissance humanism gave birth to a more modern conception of courtesy as an interaction standard designed to facilitate exchanges between citizens who, despite social and economic inequality, were deserving of consideration and respect.

This article discusses how secular humanism played a vital role in creating a Renaissance courtesy tradition that was to inspire Western civilization for many centuries to come. Included is a review of the seminal conduct books of the period and how they helped form a new conception of human agency while providing subsequent eras with valuable guidance on ideal manners.

Civility; Courtly behavior; Deference; Magnanimity; Manners; Renaissance city states; Renaissance manners

From Modesty to Magnanimity: Rupture with the Medieval Heritage

The study of courtesy is more than the study of how people treat one another. It is also the study of the spirit of an age. Shifts in political, philosophical, religious, economic, literary, and artistic conditions have a determining influence on the courtesy practices of a given era. That is why two closely connected periods in history can have substantially differing courtesy practices. This is most evident in comparative studies of courtesy standards in the Medieval and Renaissance periods.

Medieval courtesy standards were founded on the classical ecclesiastical belief that ideal behavior required “love without measure.” Modesty, prudence, humility, and a penitent spirit were qualities taught to knights and courtiers who were expected to serve the Church and rulers with selfless loyalty while minimizing violence and greed towards one another. It was an elitist behavioral philosophy that stayed out of the reach of the common population.

The Renaissance ushered in a radical transformation of this worldview. While Renaissance philosophers, statesmen, and artists accepted the legitimacy of the Church, they represented humankind as an admirable part of God's creation. This astute unification of the sacred and temporal helped bring the natural world and the embodied individual into the center of social philosophy and cleared the way for a more forgiving and more liberal view of human nature.

An educated university elite (empowered by the invention of the printing press) and a rising merchant class (enjoying surplus wealth) welcomed humanist philosophy because of its validation of earthly pursuits. This secular humanism was eloquently expressed by Gianfrancesco Pico de Mirandola who, in his now classical oration *On*

the Dignity of Man (Oratio de hominis dignitate) (1486), side-stepped the morbid fatalism of the medieval Church by affirming the sanctity of human free will: “‘I have set thee,’ says the Creator to Adam ‘in the midst of the world, that thou mayst the more easily behold and see all that is therein. I created thee a being neither heavenly nor earthly, neither mortal nor immortal only, that thou mightest be free to shape and to overcome thyself To thee alone is given a growth and a development depending on thine own free will.’”

Such mistrust of clerical infallibility was also present in the works of Rabelais (1532) who ridiculed the pretense of contrived virtue, favoring instead a natural courtesy based on an intuitive sense of personal honor. Rabelais’s democratizing dictum, *Fay ce que tu voudras* (do what thou will), implied that no dogma or elaborate rules of conduct were needed as long as a person possessed an unaffected sense of right and wrong.

The mendicant writings of St Francis of Assisi were far from the minds of the new Renaissance merchants and politicians. Matteo Palmieri gave his approval to family wealth and the accumulation of possessions in *Della vita civile* (1528). Leon Battista Alberti similarly approved of wealth by cautioning that a man without a house and possessions was seriously jeopardizing his freedom (c. 1450). In a speech given in 1427, the anti-papist political rebel Stefano Porcari passionately affirmed the moral legitimacy of wealth and argued that it was vital for the common welfare: “Let us contemplate the needs of private life. Whence are our houses and palaces procured? From riches! Whence come our clothes? Whence the meals for us and our children? From riches! Whence the means to educate our children and make them virtuous? From riches! These consecrated churches with their decorations, the walls, the towers, the defenses. . . your places and dwellings, the most noble buildings, the bridges, the streets, with what have you built them, whence do you obtain the means of preserving them, if not from riches?”

This acceptance of the corporeal affected the manner in which the body was adorned and presented in private and public. The theocratic climate of the medieval era had exercised a

stronghold over the body. Until the fourteenth century, the high valuation placed on modesty (behavioral and sexual) had prescribed that both men and women had to wear long and loose tunics that covered the entire body. Fabrics were monochromatic and styling was austere. Renaissance fashion, on the other hand, celebrated the beauty and innocence of the human body; medieval modesty (*modestus* – “keeping within measure”) was set aside for clothing that was colorful and profusely decorated with ornaments. The shape of the body was accentuated without embarrassment: short fitted jackets, tight hose, and prominent codpieces for men and tight busts and décolletages for women.

There was something quite self-celebrating about the new norms of permissible behavior. The diaries and letters of wealthy families of the epoch reveal the new enjoyment of conspicuous spending and the sense of personal power released by such displays of wealth. Giovanni Rucellai (1481), a prosperous Florentine wool merchant, wrote in his journal: “I think I’ve done myself more honor by having spent money than by having earned it. Spending gave me a deeper satisfaction . . . the rich man must be generous, for liberality is the most noble and attractive virtue which he can possess.”

Thus, the practice of “magnanimity” and “calculated deference” became means for imposing order and meaning on what was becoming a very competitive society. *Fortuna* (fortune) could be extremely capricious in this new society. The fatalistic notion of *divine providence* had helped explain many unforeseen calamities during the Middle Ages. In the Renaissance, however, *chance* came to compete with the will of God. Lurking in most powerful and wealthy men’s minds was the fear of suddenly losing their fortune through bad business decisions and political maneuverings. In Florence, where respect for the new wealth was most intense, loss of wealth was rarely looked upon with sympathy; men who fell into poverty were even shunned by their own relatives. *Deference* became a means for promoting non-conflicted and profitable alliances. This quality was quite different from the *submissiveness* of the feudal vassal. A person now

deferred to another in recognition of the other's identity and in order to avoid outright confrontation; this deference was more an act of alliance than of submission. In this volatile political and economic climate, it became important for a family to develop relationships with other families more powerful and influential than itself. This transformation of virtue as an obligation to God into an obligation to community becomes quite understandable when viewed from the economic perspective and the political structure of the new city-states.

Renaissance art also reflected the growing acceptance of the temporal. It is no coincidence that Michelangelo's statue of the Biblical *David* in the nude was placed in the public square in front of the seat of civic government in Florence. Never before since classical times had nude statues been placed in outdoor areas. Botticelli's *Venus Rising* was a similar homage to human sensuality, as were some of the figures painted by Michelangelo on the ceiling of the Sistine Chapel. A hundred years before such works would have brought immediate (and perhaps violent) Church censure.

So, unlike the courtesy literature of the Middle Ages, which coupled virtue with the search for enlightenment and divine salvation, the literature of the Renaissance encouraged the individual to deal with reality and social relations from the perspective of a personal sense of honor that remained at peace with utilitarian realities. Honor required much more than obedience to prescribed virtues. It required a considerable amount of self-reflection. The Courtesy books of the Renaissance promoted this new liberalism.

Balancing Courtesy and Integrity: *The Book of the Courtier*

The tensions between the crudity of political life in an increasingly commercial network of social relations, on the one hand, and the ideal of aesthetic excellence, on the other, are noticeable in the content and tone of one of the seminal courtesy books of the Renaissance, *The Book of the Courtier* (*Il Cortegiano*) (1529). Although medieval values of *chivalry* had become nearly

obsolete in the new urban mercantile climate, Baldassare Castiglione managed to revive the ideal of chivalric honor and style within the context of his era. *The Book of the Courtier* became one of the Renaissance's most widely read books and managed to leave an indelible imprint on the European aristocracies.

Castiglione's treatment of courtesy differs considerably from that of his predecessors. Neither brute force nor the mixing of force and piety, qualities favored by the medieval romances, are considered sufficient for the making of a courtier. The ideal courtier has to blend the graceful and the secular so as to become a courageous individual committed to justice, truth, and wise counsel. Certainly, he or she must not boast about his accomplishments or appear greedy for rewards. Discretion and self-dismissal, even in the presence of great personal worth and accomplishments, are the principal virtues of Castiglione's courtier.

Grazia (grace) and *gravitas* (dignity) assure a courtier that his speech will not seem affected or forced. The art of personality presentation is to remain unnoticeable, not because of deceitful motives but because of the natural "bearing" appropriate to a refined courtier, a bearing designed not to cause offence to others. Castiglione admonishes his courtier to "avoid affectation in every way possible . . . so as to conceal all art and make whatever is done or said appear to be without effort and almost without any thought about it."

There is a strong affinity between Castiglione's preference for lack of ostentation (*sprezzatura*) and the Aristotelian ideal of the *golden mean*, an ideal that was the basis of Cicero's *Orator*, a work that urged men of proper bearing to exhibit a "purposeful negligence" (*neglegentia diligens*) so as to give off the impression that ideas interested them more than the artifice of style. This studied spontaneity (*all'improvviso*) was also a cherished theme in Ovid, who advised young men at court to cultivate a casual look of neglect (*forma viros neglecta decet*) in order to exude self-confidence. The ability to seem unaffected became the new courtesy ideal.

Petrarch and Alberti had affirmed their faith in the human will; Castiglione furthered their

humanism by arguing that only through a disciplined application of *willful intent* could the ideal courtier manage to consistently speak the type of truths that would allow him to become a trusted and useful adviser of the court.

Unlike Capellanus, who had written of a very distinct personality suited to a theologically governed knightly culture, Castiglione managed to write a work that was in many ways urbane, universal, and not limited to a particular epoch or region. In effect, he managed to build a bridge between the world of humanism and the world of courtly intrigue, finding some meeting point that could render the process of membership in court elites morally and aesthetically satisfying despite the rampant injustices of the rising absolutist states. A series of works in Spain, Poland, Portugal, and France imitated the format of *The Book of the Courtier*, and the themes of honorable behavior and studied natural demeanor appeared frequently in the courtesy literature that followed Castiglione's work.

Balancing Religious Creed and Personal Conscience: *The Colloquies*

The Renaissance humanists attempted to avoid immutable categorizations, perhaps hoping that human awareness would increase through the confirmation of the creative will. Desiderius Erasmus (c. 1466–1536) personified this delicate Renaissance balance between the religious and the secular. Erasmus insisted that the Bible be put in the hands of ordinary laypeople so that they could read the message of the Gospels for themselves. His *Enchiridion militis Christiani* (*Handbook of the Christian Soldier*) had enormous influence at the time of its third printing in 1515. He argued that a reading of the New Testament would provoke an inner change in the reader and guide him to the love of God and humanity. Believing that a religious person was defined by his relationship to the word of God rather than by his allegiance to priests, he did not accord the clergy the right to stand between scriptures and the layperson. He believed that the philosophy of Christ was sufficiently represented in the New

Testament; thus, a person who consciously chose to live a moral life could chart his own path according to scripture and without clerical intervention.

Erasmus also believed that a culture could transform its practices and norms without falling into disorder. In *The Colloquies*, he freely permitted himself to comment on the mores and events of his time, agreeing with some while mercilessly criticizing others. He valued, for example, the ideal of loyalty embedded in the writings of monastics but wondered why celibacy was necessary for a virtuous life. He supported the maintenance of religious orders while heaping abuse on the misuse of power by existing orders. It took him 40 years to write the *Colloquies*, in the process composing one of the most complete records of life in the Renaissance.

What makes the work an excellent representation of the best the Renaissance humanists had to offer is its unrelenting preoccupation with social reform and its refusal to align itself with any particular class or political group. Humanist intellectuals were increasingly carving out a social position for themselves by claiming the freedom to criticize the nobility as well as the common population. And, certainly, Erasmus made good use of this emerging intellectual freedom – writing with irony and outright ridicule, he facilitated the acceptance of a critical intellectual spirit and the recognition of ordinary individuals as thinking rational beings.

This movement away from categorical aristocratic behavioral standards had a democratizing effect. Yet, it required new specifications of ideal manners for the general population. A rising concern over manners and the corresponding importance accorded to *civility* among strangers marked a radical break with insular courtly conduct standards. Rather than training their readers to be ideal courtiers, the new courtesy writers focused on developing rules of public conduct. Erasmus's (1530) *De civilitate morum puerilium* (*On Civility in Children*) substantially departed from the format of medieval courtesy literature. Even though the book was written for the son of a nobleman, it did not pretend to be exclusively addressed to the nobility. While, like his

predecessors, Erasmus criticized the coarseness (*rusticas*) of the peasant, he did not approve of the pretensions of the nobility. He addressed universal good manners as reflected in bodily carriage, gestures, dress, and facial expressions. He not only gave specific instructions on how one was to sit and behave at table but also promoted a civility based on consideration for the sensibilities of others. He paid little attention to social distinction, setting his work apart from the medieval courtesy writings and the works on *civilité* that were to follow in France. A universal standard was being sought, one capable of serving the rising merchant class. The book was so popular that over 30 printings were made in the 6 years following its publication. Erasmus's work led to the Europeanization of the word *civilitate*: *civility* in English, *civilité* in French, *civiltà* in Italian, and *civilität* in German.

Manners for All Seasons: *The Galateo*

Another book that had a far-reaching effect on European courtesy codes and manners was Giovanni Della Casa's *Il Galateo* (1558). Unlike Castiglione, Della Casa had no interest in providing instructions for the formation of a perfect courtier. Even though some passages in the text mention and laud certain nobles, Della Casa states early on in his narrative that the elaborate interaction rituals and posing of those who consider themselves of high station are quite distasteful and to be avoided by truly well-mannered persons.

Rather than being a book on the noble virtues, *Galateo* is a down-to-earth guide to what a person must know and practice if he is not to *offend* others. Its most important difference from other courtesy books of the period lies in the reasoning used for promoting circumspect manners. Manners are not presented as marks of aristocratic distinction but as practical devices meant to help a person do certain things and desist from doing others in order not to cause discomfort to other individuals. Its approach is psychological. Public nudity, spitting in public, eating with one's mouth open, yawning, going to bed naked, urinating, and defecating in public – these have all taken on connotations of

embarrassment and are being replaced by practices designed to hide primary physical functions from view. A *publican* civility is in the making.

The chapters of the text are fairly equally divided between the proper handling of physical functions and the rules to be followed when conversing. The author distinguishes between *etiquette*, which he admits can be pretentious and even hurtful to the sensibilities of others, and *civility*, which, when practiced without hypocrisy, provides a person with the right frame of mind for remaining sensitive towards the feelings of others: "It is certain that people who like to carry ceremonial to excess do so from empty-headedness and conceit, like the useless person they are . . . But they are incapable of learning important things."

Some of Della Casa's rules regarding bodily functions might appear quite evident to us. Yet, written just after the medieval period, they were necessary admonitions in a society increasingly concerned with concealing and refining the expression of bodily functions. Della Casa's advice to his readers was given quite plainly:

It is a repulsive habit to touch certain parts of the body in public, as some people do . . . No polite person will prepare himself for the relief of nature while others are looking on. . . It is bad manners, when you see something to nauseate you by the roadside, as sometimes happens, to turn to your companion and point it out to them. . . Refrain as far as possible from making noises which grate upon the ear, such as grinding or sucking your teeth, making things squeak, or allowing rough stones or metal objects to scrape together and rasp. . . When you have blown your nose, you should not open your handkerchief and inspect it . . . such behavior is nauseating. . . When you are talking with someone, you should not approach him so close as to breathe in his face. . . many people dislike the sensation of another's breath even if it is not tainted. . . A man who knows how to behave will take care not to get his fingers so greasy as to dirty his napkin. . . It is not polite to scratch yourself while seated at table. . . It is also bad manners to clean up your teeth with your napkin.

In all of the above examples there is a reaction against practices that must have existed at the time. Otherwise, there would have been no need to comment on them. The author's admonitions seem to indicate a new sense of disgust that requires many practices to be veiled with the

cloak of privacy: "What disgusts the senses also upsets the mind."

Della Casa's advice on the art of conversation is also based on a new aesthetic standard. Conversation is not meant to be a competitive mechanism; good conversation skills involve knowing the golden mean in the length of conversation, the speed at which one should be speaking, and the subjects that should be avoided in order not to bore one's audience. Della Casa considers all vice and all absence of good manners as ugly and degrading. He does not refer to religious predispositions but to a human need for beauty and harmony, something that he considers natural and not dependent on religious doctrine.

The works of Della Casa and Erasmus differed from that of Castiglione in one important respect. While Castiglione was trying to compose a code for the ideal courtier – a personality quite distinct from the rest of the population – Erasmus and Della Casa were espousing conformity and amiability regardless of social station. Their purpose, in some important measure, was to develop a public civility that cut across class boundaries. The *other* is the center of attention, and all physical and speech mannerisms are to be directed at making that other remain within their intellectual and psychological comfort zone. Written a few hundred years before the English books on *politeness*, *The Galateo* was to become the forerunner of the book on *tact*. It is no surprise that it eventually became extremely popular in England. Della Casa's most important advice, "Neither say or do anything to show dislike or disparagement of the other person present," would be heeded by the English conduct book writers.

Other conduct books of the Renaissance reveal this emerging trust in personal judgment. The medieval courtly literature had, in great measure, been ideological, seeking to establish political unity in a closed-off feudal hierarchy. There had been a tolerance of coarse manners in the general population paralleling the aristocracy's conviction that only the higher sectors of society could learn to appreciate and practice courtesy codes. Renaissance conduct books, however, began moving away from such elitist instruction, going to great pains to encourage people to desist from

practicing certain manners that they had been habituated to practicing. What we would take for granted today was at the time a new code of emerging manners and one that would have a considerable effect on subsequent conceptions of ideal behavior.

Legacy of the Renaissance Courtesy Standard

The legacy of the Renaissance and the courtesy literature that emerged from it cannot be understated. The manner in which Renaissance philosophers questioned the top-to-down authority of the Church cleared the way for a mankind-centered conception of religious life. The Protestant Reformation, which stood against priests who would intervene with God on behalf of their supplicants, was indebted to Renaissance humanist thought. Subsequent eras also owed much to the guides to ideal manners that appeared during the Renaissance. These guidelines spread to other European countries and, eventually, made their way into the Americas. Even now, in the twenty-first century, the debate regarding civility in private and government affairs continues, and some seminal works, including works by Benet Davetian and P.M. Forni, have addressed how a competitive capitalistic society is to maintain civility despite economic, social, and political inequalities. The debate initiated by Renaissance humanists continues.

Courtly Behavior

Abstract

Courts were the center of political and cultural life in the Renaissance. A longstanding sociological theory sets the origins of our modern concept of civilized behavior in the Renaissance courts. Differentiating themselves from medieval courts by abandoning itinerancy and becoming more and more stable, Renaissance courts assumed a fixed, enclosed, and elitist structure, with the prince or lord at its center and a complex entourage of courtiers employed in different tasks surrounding him.

At the same time, courts were places of unprecedented social mobility, where men of humble origins and great ambition could strive to obtain success and fame. In addition, they were important venues for the distribution of patronage: princes invested in writers and artists who could bring prestige to their court and make it outshine any rivals. Renaissance courts are also of paramount importance for gender studies. The courtly environment saw examples of powerful and influential females, who challenged the still existing stereotypes of women's weakness and inferiority to men. Finally, the court was one of the main topics of Renaissance satiric writings, which offered a completely different picture from the image of splendor and magnificence that the courtly environment tried to present, depicting courts as overrun by hideous vices such as envy, flattery, and ruthless competition for success.

Heritage and Rupture with the Tradition

The Renaissance Court: Meaning and Myth

A well-known theory originating with the sociologist Norbert Elias's groundbreaking work *The Civilizing Process* (first published in 1939) states that what we nowadays recognize as manners, polite behavior, and control over one's body – in short, what we define as “civilized” behavior – first developed in the courts of the Renaissance (Elias 1978, 1982). Although Elias's theory has been the object of criticism and revision through the years, it remains a pivotal piece of scholarship thanks to its highlighting of the important changes that courts and the culture which originated within them brought to the mentality and to the organization of civic life in Europe.

The court was not a Renaissance innovation: it had existed in ancient and medieval societies. Yet in the Renaissance the court assumed entirely new characteristics and an unprecedented importance that together allow us to define it as a peculiarly Renaissance phenomenon. The term “court” encompassed a multiplicity of areas of meaning, denoting at the same time a physical place, a political institution, and the many

different of people living and working within it. The third meaning – the court as an entourage – is the most important connotation of the term in the early modern period, while the related Latin terms *aula* and *curia* designated the physical place alone.

The notion of the physical presence of the court in a specific place is also an important aspect that sets Renaissance courts apart from medieval ones. In the Middle Ages, the courts were itinerant: the prince and his entourage moved throughout the kingdom, and the court was located whenever the prince was at a given time. In the Renaissance, however, as the princely staff grew, the court became more and more settled in a precise location. The term court thus began to indicate a fixed and enclosed space entrance to which was reserved for those who belonged to a very restricted group. The Renaissance court was strictly elitist in nature. It was separated from the rest of the city by physical boundaries and by its rigid codes of conduct. The courtly code of conduct dictated every aspect of life at court, from dress to social etiquette, reinforcing the notion of the courtly space as belonging only to a select few (Mateer 2000).

Scholarship has often recognized the importance of Renaissance courts and of the culture that they developed and promoted for the history of Western civilization. Defined as “laboratories of modernity” (Muchembled 2002), their concentration of culture, power, and manners made them into places where many of the behavioral norms and the customs of living that were to influence European societies in the centuries to come were first created and put into practice.

In analyzing the court as a political and social subject that shaped the reality of early modern Europe, it is important to point out that the term court also came to designate a mythical place (both utopian and dystopian) that existed not so much in reality as in the imagination of those who depicted it. The court as a “place of mind” gave birth to two antithetical representations of courtly life. There was an entirely positive representation of a courtly utopia, according to which the court was the breeding ground of the noblest virtues and the most exquisite manners, inhabited by men and

women who devoted their life to honest behavior and to the most refined pursuits. This courtly utopia, interestingly, was often presented as belonging to the past and now lost in the decay and corruption of contemporary courts. The second representation of the court was a foil to the courtly utopia, a dystopian picture where anything associated with the court becomes tainted, morally depraved, and damaged beyond repair.

The Origins of Renaissance Courtliness

An important distinction between Renaissance courts and their predecessors is that medieval courts were not places devoted to cultured pastimes and elegant manners, as in their Renaissance incarnation, and were instead more associated with warlike behavior (Muchembled 2002). According to Aldo Scaglione, the history of courtliness began in tenth-century Germany, when the emperor Otto I started attracting talented men into his entourage, investing them with the office of bishop, while at the same time employing them in administrative positions for the empire (Scaglione 1991; Jaeger 1985). In the same period, there was a shift in cathedral schools, which no longer focused on producing teachers of the Bible and became more oriented towards training religious leaders and public administrators. Courtier-bishops and cathedral schools started laying the foundations for the development of courtly culture and of courtly manners, and the German episcopate became “a training ground for manners.” Courtliness, however, abandoned its association with cathedral schools during the twelfth century, when it shifted to secular courts (Scaglione 1991).

After the initial development of courtliness in Germany, Renaissance Italy was the place where the court came to assume a unique role as the foundation of cultural and social life. In Italy as well, courtly manners were developed and systematized to their highest standard, thanks to Baldassar Castiglione’s extremely influential manual for conduct at court, *Il libro del cortegiano* (Castiglione 2000) (*The Book of the Courtier*).

The predominance of the court structure throughout the Italian peninsula was also a Renaissance innovation. During the Middle

Ages, only the south of Italy was structured as a princely court, due to the presence of the kingdom of Naples. The papal court had been in exile in Avignon for the greater part of the fourteenth century, but had returned to Rome at the beginning of the fifteenth century. The main form of government in the northern and central parts of Italian peninsula in the Middle Ages was represented by city-states with a republican government. Yet the situation of these republics had begun to change over the course of the late thirteenth and early fourteenth century, a time when Italian Renaissance courts were still small structures, whose claim to power often rested on shaky foundations. It was only during the course of the Renaissance that they were able to expand, to consolidate their power, and to become the cultural centers of the period.

Finally, it is necessary to underline that the history of Renaissance courts is also complicated by the fact that major courts (ruled by a prince, a duke, or the pope) coexisted with various “satellites” represented by minor courts or households. Members of the minor nobility, powerful members of the clergy such as cardinals, the female consorts of rulers, and, in some cases, even rich and influential private citizens were holding their own courts. This multiplicity of courts created a particularly fertile, but also hectic and extremely competitive, environment. It was an environment in which, furthermore, the most ambitious men of the time could decide to try their luck and work their way towards social advancement.

Innovative and Original Aspects

The Structure of Renaissance Courts

Renaissance courts, both large and small, tended to share some general characteristics. Courts usually had a rigid structure, centered on a prince who in the course of the early modern period would become more and more powerful, often to the point of being represented as a God-like figure. Even in the less absolutistic models of court, the prince stood at the center of the complex structure of the court, providing its order. The prince’s favor or disfavor could determine a courtier’s fate: he

was therefore respected and feared, and contemporary writings on courts advised courtiers never let down their defenses when in the presence of the prince. Instead, they should always behave as if they were in the presence of a ferocious and unpredictable lion.

The facility with which one could rise or fall in the favor of a prince made the court an extremely competitive environment. Courtiers knew very well that they could never consider any position, even the most successful one, as permanent and safe; and they were also very aware that the misfortune of another courtier could result in their own good fortune. At court, that is to say, one needed to guard oneself not only against the fickleness of princely favor, but also against the potential attacks of fellow courtiers.

At the same time, the competitiveness of the courtly environment also presented men of talent born into the lower social strata of society with an unparalleled opportunity to climb the social ladder. This opportunity for social advancement was, however, paired with a constant anxiety both on the personal level – due to the constant instability of a courtier's position – and on the class level, since individuals belonging to the higher levels of society could feel at risk of being superseded by ambitious and talented ones from below.

The court was also a place where constant performance was a necessity. This theatrical aspect was typical of the Renaissance court and is another feature that distinguishes it from its medieval counterpart. The necessity of constantly reaffirming one's talents and accomplishments in front of the prince, of making oneself noticed in order to avoid being neglected in the distribution of rewards or falling from grace, meant continuously engaging in performative behavior. In addition, the main function of the court was also to showcase the power of its prince: a function that was especially critical in Italian courts, which were relatively new and therefore in need of persistent assertion of their power. As a consequence, it was imperative that the court publicly displayed the power of its prince. No one – neither the courtiers, nor the prince – was exempt from the pressure to enact their power, talent, refined manners, and intellectual sophistication.

Renaissance courts also offered new opportunities to women. Though still far from being considered equal to men, Renaissance women, in some cases, experienced an unprecedented degree of power and influence at court. This feature of Renaissance court is of paramount importance for the history of women.

Court Culture, Patronage, and Status

As cultural centers of the Renaissance, the courts worked to sustain the ideology on which the courtly system was based. Court culture created tales, beliefs, and symbols to establish its set of values and to reinforce its own existence. Renaissance courts represented a distinctive combination of power and elite culture. In order to support a fitting image of themselves, courts created what has been called a “marriage of power and imagination” (Martines 1979).

Courtly patronage, by offering support to some of the most gifted writers, artists, and musicians of the time, worked precisely towards the goal of creating and sustaining the best possible image of courtly power. The talents that were attracted to the court brought prestige to it, celebrated courtly power in their works, and created an aura of grandeur around the prince and his entourage. Renaissance courts also rivaled each other in influence and splendor, and a court's ability to attract the most highly reputed artists and *literati* was the equivalent of a publicity move aimed at asserting its superiority over any potential competitors.

This resulted in an unprecedented alliance between art and power. Works of art were created not for a market, but directly for patrons, who regarded them as tokens of their influence and refinement. Patronage was also of great benefit to the artists, who could count on demand for their work and on a secure income. This bargain, in turn, gave patrons considerable influence over the artist's creations, limiting the freedom of court artists (Martines 1979).

Patronage of the arts and the consumption of refined goods should be seen in connection with the need of the Renaissance court culture to display luxury and power. The same desire motivated the construction of buildings, a practice that

allowed princes to make statements of power for the entire city and for visitors from rival courts. This continuous display of power and luxury has been seen as a way to support the princes' claim to power and to assert their role as leaders (Martines 1979). It was particularly important for the *signori* who ruled Italian courts, since their position was often new and relatively unstable, and therefore in need of continuous reinforcement.

The consumption and the display of Renaissance courts almost inevitably resulted in a dramatic shortage of money. Princes often overspent their budgets and eventually found themselves in dire straits. In addition to the expenses for buildings and for works of art, they often squandered vast amounts of money on ephemeral matters such as celebrations, feasts, and banquets, which can appear puzzling to the modern eye. In order to explain the courtly vogue for squandering money on such events, we need to take into account that occasions like these revolved around fundamental issues of status. In a society where everyone was competing to affirm their status, lavishing large sums on luxury and in feasts brought a return in prestige. In addition, liberality was regarded as a core virtue of a good prince, while one who leaned towards parsimony risked alienating his subjects. Similarly, magnificence, the act of spending money on luxurious objects, of sponsoring building projects, and of offering patronage to artists, was considered a pivotal virtue in the Renaissance mentality.

It was not only princes who incurred great expense in order to achieve and maintain status, but also many of their subjects. Renaissance courtiers needed to invest in statements of prestige such as clothes, jewelry, and horses before trying their luck at court – with potentially ruinous consequences, in the event that they eventually were not able to gain the favor of the prince.

The Prince and His Power

Securing the prince's favor – his grace, as it was referred to in Renaissance writings on courts – was the primary aim of every courtier. The prince was the fulcrum of the court and the embodiment of power that was seen as radiating directly from him. Everything at court centered around the

prince, and energies of his entourage converged on serving and pleasing him. In some cases, such as at the court of Elizabeth I, the monarch also became the incarnation of moral virtues (specifically, in her case, those of Protestant morality). From the Renaissance period to the Baroque, the power of the prince became more autocratic, rendering him increasingly distant even from those among his courtiers who could claim the highest ranks among the nobility.

Yet for all his influence, the prince's power needed to be carefully constructed and constantly maintained. Renaissance texts often convey the notion that the power of the prince was in need of ornamentation and continuous embellishment. In addition, recent scholarship has pointed out that even the prince was not immune from the necessity of mastering the courtly code of comportment and engaging in constant performance at court, since it was precisely on such mastery and performance that the display and the retention of power at court was based (Snyder 2009).

Nevertheless, it is undeniable that the ability of the prince either to concede or deny his grace was the source of great apprehension among his courtiers. Since the fate of any courtier depended on the will of the prince, and since his will could change on the spur of the moment, he was often also represented as the personification of the Wheel of Fortune, who could suddenly raise a man to the highest honor or cause him to lose everything he had ever achieved.

In order to gain and to maintain the prince's favor, courtiers needed first of all to make themselves visible to him, putting on show their virtues and talents for his eyes. In addition, to win his grace courtiers employed obedience and also, very often, flattery. A courtier was expected to obey all the prince's commands and to fulfill all his desires – or, if he really wanted to succeed, to foresee them before they were even spoken. Courtiers were also supposed to like whatever their prince liked and to despise whatever he despised, in order to please him as much as possible. The obedience required from courtiers in some cases raised ethical dilemmas, such as what they should do when the orders received from their prince conflicted with their own moral code.

It would be simplistic, however, to view courtiers as completely subject to the prince. Through their display of courtly arts, courtiers aimed to influence the prince in order to receive rewards or privileges. The most favored and esteemed among courtiers, in addition, were often able to have an impact on the prince's decisions. The possibility of becoming a respected counselor to a prince, one who could assist and guide him, was, indeed, the highest aspiration of many Renaissance courtiers.

The Figure of the Courtier and His Role at Court

The court was composed of a wide array of subjects who differed both in their social origins and their role at court. Some courtiers belonged to the minor nobility: they were often the rulers of small estates located within the prince's domain. Such noble-born courtiers, whose aristocratic titles rendered them worthy of acting in lieu of the prince, usually held the most prestigious roles, such as leading the prince's armies, governing territories under his jurisdiction, or going on diplomatic missions. Many high ranking courtiers, because of their strong humanist education, were also prominent figures in the cultural life of the court, in some cases writing literary works (such as chivalric poems) that brought fame to it. Courtiers who did not come from a noble background were instead assigned more lowly tasks, such as working as stable masters, attendants, and service staff. For a long time, the distance separating noble-born courtiers from their non-noble counterparts was apparent, with higher-ranking courtiers traditionally seen as closer to the prince and often styled as his companions. By the sixteenth century, however, the distance between the prince and his noble-born courtiers had widened significantly, separating even elite courtiers from their ruler (Cox 2016). Noble-born courtiers were often suspicious of their lower-ranking counterparts, whom they saw as a threat to their status. The unflattering portraits of those who rose too quickly at court and the discontent of others who considered themselves unjustly neglected that we find in some in early modern writings on courts can be partially explained by the uneasiness of

elite courtiers forced to compete with ambitious social climbers.

The *Book of the Courtier* and the Definition of Courtliness

Despite the importance of the courtier for Renaissance culture, for a very long time there were no depictions of his ideal features nor definitions of his role at court. He was a figure who was almost always depicted in an unflattering light, with negative representations appearing in satirical writings against courts and courtiers (Anglo in Dickens 1977).

One of the earliest positive depictions of courtiers is offered by Diomedes Carafa's 1479 treatise *Dello ottimo cortesano* (*On the Excellent Courtier*), an early example of a genre – manuals offering advice to prospective courtiers – destined to enjoy a vast success in the sixteenth and seventeenth centuries. A positive image of the courtier was finally produced at the end of the 1520s, with the publication of the most influential work on courts and courtiers, followed by a steady stream of reprints, imitations, and even parodies: Castiglione's *Book of the Courtier*. Castiglione belonged to the class of the elite courtiers: both his paternal and maternal ancestors were descended from the northern-Italian nobility, and he was directly related to the ruling family of Mantua on his mother's side. He began his career as a courtier in his native Mantua and later moved to the court of Urbino, at the time one of the most culturally refined and influential courts of the Italian peninsula. Like many noble-born courtiers, Castiglione acted as a diplomat and an ambassador, in his case for both the duke of Urbino and the pope.

Structured as a dialogue, the *Book of the Courtier* is divided into four books, each dealing with a specific topic concerning the courtier and his life at court. The dialogue is set in the Urbino court (ruled by the Montefeltro dynasty) where Castiglione was a courtier and casts some of his closest acquaintances as speakers. The text was first printed in 1528, but it had been circulating previously in manuscript form and appears to have attracted considerable attention before its publication. The main novelty of the *Book of the*

Courtier resides in featuring, for the first time, a group of courtiers who take themselves and their role and function at court as a topic for reflection and discussion: the goal of the speakers is to define the qualities of the ideal courtier and of his natural companion, the perfect court lady. The dialogue structure of the text allows Castiglione to portray the courtiers and their culture in action. It is also worth noting that the occasion for the discussion of the perfect courtier is described as a game; so, the dialogue portrays one of the sophisticated and erudite pastimes that were common practice among Renaissance courtly elites. Over the course of four evenings, under the supervision of Duchess Elisabetta Gonzaga and her lady-in-waiting Emilia Pia, the courtiers of Urbino engage in an elegant battle of wits aimed at “forming in words” the perfect courtier.

On the first day of the dialogue, the *Book of the Courtier* introduces its key term. The ideal courtier should be able to employ in all of his actions something defined, with a neologism, as *sprezzatura*, an almost untranslatable word that conveys the notion of a carefully constructed nonchalance, while being semantically related to the word *sprezzare*, disdain. *Sprezzatura* is also defined in the *Book of the Courtier* as “the art of concealing art”: the courtier always needs to style his behavior with extreme care and yet make it appear as if it were entirely natural. The ideal courtier will excel at all the activities considered important in court culture, from the more military ones, such as jousting and fencing, to more social and artistic activities, such as engaging in polite conversation and dancing or playing music, but he will always hide any effort behind such accomplishments. Only through the attentive practice of *sprezzatura* will the courtier be able to gain his prince’s attention and finally to be granted his “grace” or favor.

The Goal of Courtliness

Castiglione’s *Book of the Courtier* offers a portrait of courtliness as the way in which court nobility engage in refined activities. The depiction of the court and its inhabitants presented in the dialogue, the interaction between the protagonists, the topic of the discussion, and the very nature of “game” surrounding the formation of the ideal courtier

may reinforce the stereotype of Renaissance courts as sites where an idle elite spent their days in elegant but ultimately useless pastimes.

The apparent idyll of courtly pastimes, however, hides a much harsher reality. Courtliness, intellectual refinement, and elegant manners often concealed violence and conflict. Courts, by stimulating competition for princely favor, and with their frequent and sudden upheavals of fortune, were the perfect environment for the development of cut-throat rivalry among peers. The ritualization of relations demanded by courtly manners was also therefore a way to contain potential outbreaks of violence (Muchembled 2002).

According to the theory originating with Norbert Elias, courtliness was a means of domesticating a previously independent class of warriors and subjecting them to the authority of the prince (Elias 1978). The discontent expressed by court writers in texts criticizing courtly life has been interpreted as a lament for this lost independence. Elias’s theory has been called into question on the grounds that it is too general to provide a thorough explanation of the reality of different courts. At the same time, however, the pages of the *Book of the Courtier* offer testimony to issues such as fear of disempowerment, of triviality, and of effeminacy that were a source of anxiety for Renaissance courtiers.

While the first book of the *Book of the Courtier* is devoted to defining the qualities of the perfect courtier, in the second book the participants in the dialogue debate how the courtier is supposed to put his virtues into practice. The second book shows significant signs of uneasiness concerning the role of the courtier and the aim of courtly manners by evoking the virtuous courts of the past, while lamenting the decay of most present-day courts, and by implying that, despite all of his accomplishments, the courtier’s relationship to his prince could easily be a troublesome one.

The problem of the potential triviality of courtly arts and of the complex rapport between the courtier and his prince is confronted in the fourth book of the dialogue. In this part of the text, furthermore, a courageous attempt is made to carve out for the courtier a prominent role at the

side of his prince. The courtly arts that have been outlined in the previous books are justified as ways to capture the attention of the prince and almost enchant him, with the aim of gaining his confidence and trust, in order to become his wise, moral counselor. In a society where princes were depicted as over-powerful, childishly whimsical, often prone to fall prey to vice and under the bad influence of devious flatterers, the perfect courtier's role was to guide him along the path of virtue instead. Courtly arts, therefore, become a "salutary deception" practiced by the courtier with a concrete and moral end in mind. Assigning the role of counselor to the courtier also solved the problem of his disempowerment, establishing an influential position for him. Yet the growing absolutism of early modern courts rendered this role very difficult to exercise in reality.

Impact and Legacy

The Legacy of the *Book of the Courtier* and the Evolution of Manuals of Court Conduct

The *Book of the Courtier* enjoyed a remarkable success. After the first edition in 1528, the book was soon reprinted, for a total of 62 editions in Italy over the course of the sixteenth and of the seventeenth centuries; publishers also appear to have competed to produce more attractive versions of the text, with new prefaces and notes added to the editions. The popularity of the *Book of the Courtier* was not restricted to Italy alone. Around 60 translated editions of the text were published in the sixteenth and early seventeenth century, in languages that included French, English, Spanish, German, and Polish. It was not until the 1650s that a significant decline of interest took place.

In addition to translations, the popularity of Castiglione's work led to a number of imitations, with over a thousand books offering advice to courtiers being published in Europe in the sixteenth and early seventeenth century (Burke 1995). There is, however, an important difference between Castiglione's *Book of the Courtier* and the works that followed it, a difference that is perceivable even in the space of a few years. As

princely power became more detached from courtly elites, the already problematic model of the courtier-counselor set out in the last book of the dialogue became even less likely to find a counterpart in reality. As courts became increasingly bureaucratized, each member of court began to have his own specialized position. This resulted in court intellectuals experiencing a reduction in their autonomy, which in turn led to a decrease in the possibility of exerting any significant influence on the prince. This change is reflected in the development of manuals for the instruction of the secretary, a specialized figure who was in charge of assisting his lord, but not of advising him. In addition, mastery of the courtly code of conduct and the performative aspect of courtliness became more important for gaining and for maintaining power at court (Snyder 2009).

The most important writings on courtliness produced after the *Book of the Courtier* reflect this turn of events by moving away from Castiglione's emphasis on the courtly arts and insisting instead on providing useful, down-to-earth, and practical advice for ambitious courtiers whose main intent was to climb the social ladder at court. Or in other less cynical and more pessimistic cases, manuals of conduct at court presented themselves as sets of recommendations for surviving the increasingly merciless competition among peers at court.

Some of the most interesting writings on courts that emerged in the wake of Castiglione's masterpiece – for example, Stefano Guazzo's *Civile conversazione* (*Civil Conversation*, 1574), Giambattista Giraldis Cinzio's *Discorso intorno a quello che si conviene a giovane e nobile e ben creato nel servire un gran principe* (*Discourse on What Benefits a Young Well-Mannered Nobleman in Serving a Prince*, 1569), and Torquato Tasso's *Malpiglio, overo de la corte* (*Malpiglio, or on the Court*, 1585; Tasso 1973) – offer very different pictures of courtly life and models of conduct at court from the *Book of the Courtier*. All of these works prescribe less zealous conduct on the part of the courtier than the one proposed by Castiglione, moving away from the active pursuit of virtue at court to passive contentment with the mere avoidance of vice. These models of conduct

were more feasible to attain in the grim reality of contemporary courts than the high-minded portrait painted in the *Book of the Courtier*. The ideal of the courtier-counselor was left aside, and the courtier was advised instead to concentrate on surviving the threat of cut-throat competition and the risk of sudden fall from grace that are a constant of life at court. Both Giralaldi's *Discourse* and Tasso's *Malpiglio*, in addition, present an idea of courtliness as a set of precepts for self-defense against the dangers of courtly life. The courtier is advised not to make too much of a display of his talents in order to avoid the danger of provoking the envy of his fellow courtiers or even of the prince. Prudence, as a result, becomes the most important virtue for the courtier, while dissimulation is recommended as the only way to protect oneself from the omnipresent menace of envy.

The endorsement of prudence, dissimulation, and simulation paves the way for the morally ambiguous practices set out in seventeenth-century manuals of conduct, exemplified by the "chilling cynicism" (Anglo 2005) found in a text such as Lorenzo Ducci's *Arte aulica (The Courtly Art, 1601)*. This new notion of the courtly code of conduct created the basis for the disenchantment with courtliness and with life in general that one sees in Baroque writings on courts.

Courtliness and the Renaissance Self

Court culture, with its rigorous code of conduct and its performative structure, compounded by the attention devoted to secrecy, prudence, and dissimulation, also had a profound influence on notion of the Renaissance self. For a long time, the dominant scholarly theory concerning issues of selfhood and individuality in the Renaissance was the one proposed by Jacob Burckhardt in his *The Civilization of the Renaissance in Italy* (1860). According to Burckhardt, the Renaissance witnessed for the first time in history the "birth of the individual" in the modern sense. In the Middle Ages, men and women's identities depended on their belonging to a group or collectivity. In the Renaissance, by contrast, people began to strive to affirm their unique identities and to differentiate themselves from their peers as much as possible. The desire to excel that Burckhardt sees as typical

of Renaissance individuals played the leading role in this process, as did the centralized power structure of the court and distinctive kind of competitiveness that court culture promoted. In Burckhardt's opinion, the power structure of the courts fostered the individuality, not only of the prince, but also of all those who were part of his entourage: all members of the court "were forced to know all the inward resources of their own nature, passing or permanent; and their enjoyment of life was enhanced and concentrated by the desire to obtain the greatest satisfaction from a possibly very brief period of power and influence" (Burckhardt 1990).

Burckhardt's notion of the birth of the individual in the Renaissance has met with increasing skepticism in recent times, and scholars are now stressing that collective identities remained strong during the Renaissance. Nevertheless, the influence that court culture had on shaping particular aspects of selfhood in the Renaissance is still an important factor. In his monograph *Myths of Renaissance Individualism*, John Jeffries Martin has identified different forms of identity in the Renaissance. Among the forms of identity, he emphasizes the prudential self and the performative self, the structure of both he sees as directly related to features of life at court. The pressure to perform that courtly life entailed, along with the strict codes that operated in this environment and were described in books of conduct, created a need to distinguish between what should be revealed and what should be kept hidden. Dissimulation was key in navigating potentially dangerous situations. Such issues (together with the even more powerful need to hide one's beliefs from the Inquisition) strongly influenced the formation of the prudential self. The performative self is described by Martin as the direct opposite of the prudential self: while the prudential self was reserved and carefully chose what to display, the performative self was concerned with acting and with calling attention to its performance. Martin underlines how courtesy books had an important impact on the evolution of the performative self. These books encouraged readers to reinvent themselves and taught them to play the right role at the right time. Courtiers, as a result, had to figure

out how to be at the same time prudential and reserved, on the one hand, and avid performers, on the other (Martin 2004).

The dynamics of court culture also resulted in dissimulation becoming more and more significant in a courtier's life. According to Jon Snyder, in the period from the early sixteenth to the seventeenth century, dissimulation became a constituent part of courtliness, to such an extent that it was regarded as an unwritten rule of the courtly code of conduct. In texts complaining about life at court, however, dissimulation was more of a defensive practice and the sign of an "insuperable split" between the courtier's public and private persona. Court culture, in the end, was a system designed to ensure that appearance and reality never coincided (Snyder 2009). The courtier, in addition, needed to become skilled in observing his peers' behavior, knowing that they would, in turn, try to investigate his conduct. Interactions between courtiers were therefore based on a dynamics of mutual psychological scrutiny, and the court, in Snyder's opinion, became not only a place of cultural production and a political center of power, but also a system of communication. All of these issues had a profound influence on the development of the modern notion of the self as divided between a public persona and the privacy of one's inner thoughts.

Women at Court

It is important to underline that the impact that court culture had on the identity of its members concerned women as well as men. One of the major novelties of court culture was, in fact, that it applied to both sexes. It could even be argued that Renaissance courts and their cultural environment had a more significant impact on women than on men.

First of all, court culture allowed a new, close interaction between its male and female members that profoundly shaped Renaissance gender dynamics. Moreover, Renaissance courts allowed women to experience a significant amount of influence and power. In the opinion of some scholars, it was precisely thanks to such changes in court culture that notion of women as inferior to men began to be challenged (Cox 2016).

In the past, scholarly readings of the relationship between court culture and women tended to underscore their subjection to male power. This view dates back to an influential essay by Joan Kelly-Gadol, provocatively entitled *Did women have a Renaissance?* (Kelly-Gadol in Castiglione 2000). According to her interpretation, Renaissance noblewomen were little more than aesthetic objects. Kelly-Gadol saw a reduction of female autonomy in the Renaissance in comparison with the Middle Ages and attributed this phenomenon to the increased control of the state or the court over the feudal power of the nobility. In her view, feudal noblewomen of the eleventh and twelfth centuries were able to engage directly in cultural activity and even in some cases to exercise political power. By contrast, she considered women's access to power in the Renaissance as only indirect and provisional. Kelly-Gadol referred to the *Book of the Courtier* in order to show the purely aesthetic role of women in Renaissance court culture, underlining how in Castiglione's dialogue only four women are admitted to the conversation, and of the four, only two are participants, but even they do not actively contribute to the discussion. Kelly-Gadol also underscored the role of the humanist education that elite Renaissance women received, noting that it required women to be placed under male cultural authority.

In recent years, scholarship has begun revising the notion of Renaissance women's subjugation to male authority both in the social and in the cultural sphere, focusing instead on the many possibilities for influence and autonomy that Renaissance court culture offered to women. Castiglione's *Book of the Courtier* is still adduced as evidence, but now to stress that the very presence of women among the interlocutors of the dialogue was a significant novelty.

The theatrical and performative character of Renaissance courts demanded that everyone associated with the court should be educated and able to behave publicly according to its complex and culturally refined code of conduct, and court ladies were part of courtly performances as well as men. As a consequence, they had to possess the manners, the education, and the conversational skills deemed necessary within court culture,

especially during occasions, such as ceremonies or visits from foreign officials, when the image of the court itself was at stake (Cox 2016). In order to comply with these necessities, girls belonging to elite families received a rigorous education from childhood aimed at preparing them for the numerous responsibilities that they would have to face as court ladies and as wives of influential members of the court.

Manuals of conduct at court specifically designed for court ladies began to be produced and circulated in different European countries. The first attempt at creating a manual of court conduct specifically addressed to a female readership is generally considered to be Anne de France's *Les enseignements d'Anne de France, duchesse de Bourbonnais et d'Auvergne, à sa fille Susanne de Bourbon* (*The Teachings of Anne of France, Duchess of Bourbonnais and Auvergne, to Her Daughter Susanne de Bourbon*), written around 1505, and published between 1517 and 1521. Other manuals for court ladies soon followed, such as Lodovico Domenichi's *La donna di corte* (*The Court Lady*, 1564). An intriguing and original example in this genre is Annibal Guasco's *Ragionamento a D. Lavinia sua figliuola, della maniera del governarsi ella in corte, andando per Dama alla Serenissima Infante D. Caterina, Duchessa di Savoia* (*Discourse to Lady Lavinia His Daughter Concerning the Manner in Which She Should Conduct Herself When Going to Court as Lady-in-Waiting to the Most Serene Infanta, Lady Caterina, Duchess of Savoy*, 1586) (Guasco 2010). The text is presented as a *vade mecum* for the author's talented daughter, who since her early years had been provided with an elite education, preparing her to become a lady-in-waiting worthy of a princess, and the work was given to her at the moment when she was about to begin this career.

A ruler's consort had to possess even more sensitive skills than those required for a lady-in-waiting. She might be expected to cooperate with her husband in the management of the state, and, most importantly, she would often be called on to fill in for him when he was absent at war or, if he died prematurely, to act as a regent while waiting his heir to come of age. This happened fairly

frequently in Renaissance courts and resulted in court ladies acquiring more autonomy, influence, and visibility. A ruler's consort also had her own courtly entourage, distinct from that of her husband, and surrounded herself with cultured and talented ladies who – as in the case of Annibal Guasco's daughter mentioned above – were often carefully raised by parents with the aim of providing them with the best instruction that they could afford in the hope that their skills and education would enable them to participate in prestigious courts. Female artists and performers, such as musicians and singers, were also increasingly sought after in Renaissance courts.

Moreover, like their male counterparts, powerful and affluent court ladies were active patrons of artists and writers. Artistic patronage allowed female rulers to stress the legitimacy of their rule in a society that still generally regarded women as unfit for positions of power. Giving their financial support to church building or commissioning religious works of art could, in addition, help women rulers to present an image of themselves as chaste and God-fearing, and therefore alien from the stereotype of female lasciviousness that continued to pervade Renaissance culture.

The rise of women within court culture contrasted with persisting notions of female inferiority, weakness, and sexual wantonness. According to the Aristotelian interpretation of female biology that had been influential in Europe since the thirteenth century, women were an imperfect, lesser version of men. A female occurred whenever hostile circumstances prevented the creation of the perfect human being, that is, a male. A female human being, according to this view, was a nonfully formed male. As a consequence of their imperfection, females were considered to be weak and emotionally unstable – in short, almost child-like in their physical and intellectual development and therefore unsuited for any roles requiring responsibility and physical and intellectual strength. Women's immaturity also made them more likely to fall prey to their instincts, and as a result, they were regarded as more prone than men to sexual promiscuousness. Recent scholarship has underlined that the Aristotelian view of women's inferiority became more

and more at odds with the reality of the Renaissance courts all over Europe, and court culture has been credited with producing notions of womanhood that could challenge Aristotelian theories (Cox 2016).

The *Book of the Courtier* provides a valuable testimony to the popular Renaissance debates on the nature of women and their role in society. The third day of the dialogue, in fact, is devoted to the construction of the perfect court lady (the ideal companion of the courtier depicted in the first two books) and features a debate between speakers who present progressive and conservative visions of womanhood. The speaker supporting the cause of women rejects the Aristotelian notion of their inferiority and proceeds to sketch a picture of the court lady with the same accomplishments and – most importantly – the same moral virtues as the courtier. Yet despite having the same qualities and despite being expected to engage in similar activities at court (including conversation, music, and dancing), there are some fundamental differences between the courtier and the court lady. The courtier focuses on traditional masculine traits, such as robustness and vigor, while the court lady concentrates on being graceful and avoiding the kind of physical activity that might make her look too masculine.

Castiglione's preoccupation with defining the masculine qualities required in the courtier is related to the anxieties that surrounded the courtier's masculinity. These anxieties, in turn, have been explained as related to the presence of women, especially, influential and powerful ones, at court. The role of women at court can also be explored in terms of the relationship of court ladies to male performances of courtliness. Within the theatrical dynamics of court life, court ladies were often intended to have the role of evaluating men's performance of courtly manners. Elias's notion of the civilizing process enacted by court culture on a previously untamed nobility can also prompt a reading of court women as pivotal in enforcing the domestication of warrior aristocrats and their transformation into refined courtiers. According to this reading, the discontent expressed in writings lamenting the conditions of life at court can be interpreted

as reflecting the unhappiness of former warriors who saw themselves tamed by a female-dominated court.

The role of court ladies as judges of men's performance of refined manners is related to the importance of courtly love among the European elites of the time. In courtly love, the male lover declares his inferiority to his beloved and strives to behave in a brave and honorable way in order to prove that he is worthy of her favor. David Quint has underlined how the dynamics of courtly love – an adoring subject who longs for the favor of his superior – recalls the relationship between the courtier and the prince. As a consequence, Quint interprets the misogynistic outbursts found in writings on courts (such as the *Book of the Courtier*) as actually directed towards the prince. It was easier and safer for courtiers to vent their anger on court ladies, already the object of a long tradition of misogyny, than to challenge directly a system that they often saw as neglecting the virtuous (Quint in Castiglione 2000).

Anticourt and Anticourtier Writings

Renaissance writings on courts and courtiers not only provided advice to prospective courtiers. They also offered testimonies which belied both the image of the court as a place of cultural refinement and the notion of courtiers as the embodiment of good manners that are still part of the modern representation of Renaissance society. Negative depictions of courts and courtiers were widely disseminated throughout Renaissance literature, in a variety of different genres. One of the most popular examples is Enea Sivio Piccolomini's *De curialium miseriis* (*On the Miseries of Courtiers*), written in the form of a letter to a friend and dated 30 November 1444 (Piccolomini 1928). Piccolomini's text gathers together all the most common clichés concerning the evils of court life that were later developed by sixteenth-century anticourt satires: the courtiers' flattery of the prince, the cold-blooded competition among courtiers, the envy of those who benefitted from the prince's favor, and most of all, the lack of liberty suffered by those who voluntarily submitted themselves to the yoke of service to the prince. Texts like Piccolomini's

were the legacy of a preexisting medieval tradition – represented, for example, by writings such as Walter Map’s twelfth-century work *De nugis curialium* (*Courtier’s Trifles*) – that portrayed the court as the antithesis to Christian virtue because of its mundane nature and focus on material gains. Renaissance anticourt texts perpetuated the vision of the court as a place where virtue could not exist, and yet they moved away from the medieval Christian perspective by focusing instead on the earthly shortcomings of the court. The *De curialium miseriis* is based on Piccolomini’s own experience as a courtier and features a portrait of its narrator as an ambitious young man who begins his career as a courtier confident of his own talents and determined to acquire fame and wealth in the service of his prince. The image of the gifted and motivated young courtier with aspirations to success is a common feature of writings hostile to the court, as are representations of the disillusionments and the failed hopes that inevitably accompanied his life at court. Piccolomini presents the desires – for honor, power, riches, and pleasure – that can lead a man to become a courtier and then proceeds to explain in detail how the court is the negation of each and every one of these desires. At court, he explains, life is unpleasant, and all delights of the senses are denied. In addition, only sycophants are rewarded by the prince, and, as a consequence, recognition and riches remain only a mirage. Yet Piccolomini’s anticourt lament also highlights how, in spite of all of the court’s shortcomings, many men of talent continue to be attracted to it and to invest in it their highest hopes of success.

Writings against courts and courtiers rose in popularity during the sixteenth century, encompassing different literary modes. In collections of verse satires, it is common to find at least one piece of work bemoaning the many afflictions of courtly life.

Among the famous examples of this genre, which would become models for later negative depictions of courts and courtiers in various European literatures, are Ludovico Ariosto’s verse satires. In the first of these satires, Ariosto describes the events that led him to quarrel with his patron, Cardinal Ippolito d’Este, and his

dissatisfaction over the treatment he received at court. Another satire recounts his life under a new patron, Ippolito’s brother, Alfonso d’Este, Duke of Ferrara, and paints a picture of the difficult conditions of early modern court intellectuals.

Anticourt writings in prose often took the form of a dialogue in which one of the speakers states his intention to join the court, but is eventually persuaded against his decision by interlocutors who express disappointment over their own careers at court and enumerate the physical and psychological discomforts that courtiers are forced to tolerate.

Invectives against the court are also frequent in pastoral plays, where one can find the character of the disillusioned ex-courtier who explains how the luxurious appearance of the court hides a reality of squalor and treachery and who praises instead the happiness of the shepherds’ simple lifestyle.

The themes and the subjects featured in anticourt writings are strikingly similar even in works belonging to different genres and to different national literatures, to the extent that they can be seen as recurrent sets of *topoi* of anticourtliness. These *topoi* involve both the representation of the court, the dynamics of courtly life, and the figures of the courtier and the court lady.

Courts are described as the cradle of the most hideous vices: flattery, envy, deceit, cut-throat competition among peers, and moral depravity. Echoing the motto of the Roman poet Lucan, “*exeat aula, qui vult esse pius*” (“leave the court, whoever wants to be virtuous”), anticourt writings present the court as a place that fosters only immorality, so that no virtuous man can enter it and leave uncorrupted. Courts are also defined as the place of fallen hopes, where only the worthless are rewarded, while the worthy and virtuous are denied well-deserved honors and rewards. Princes are depicted as vain and fickle, an easy prey for sycophants, whom they reward, while disregarding their loyal and deserving servants. Courtiers, on their part, are well versed in the art of duplicity, and they will stop at nothing to obtain material gains. There is no honesty at court, and no friendship is possible between courtiers, intent as they are at putting each other down in order to

make themselves more pleasing to their lord. Court ladies are depicted as supercilious, self-obsessed, and preoccupied with futile activities. Daily life at court is a constant source of pain. The courtier must be aware at all times that each of his peers is constantly scheming behind his back. In addition, every sort of material comfort is denied at court. Courtiers are forced to reside in squalid rooms and often also to share unclean, shabby beds. Anticourt satires devote a good deal of space to the depiction of the horrible dinners eaten by courtiers in the servants' quarters, with dirty tableware, rotten food, and acidic wine, while the prince and his closest associates enjoy a superb meal. Courtiers always squander their money on the expenses needed to sustain their lifestyle, and poverty and a lonely death are the destiny that awaits anyone who enters the court.

Satirical depictions of courts and courtiers such as those offered by Piccolomini and Ariosto influenced generations of satirists to come, and the court remained a popular topic in satirical writings well beyond the sixteenth century. The legacy of anticourt satires is still, in fact, evident nowadays, with the word "courtier" often employed in modern languages as a synonym for an obsequious yes-man.

Cox, Leonard

Born: c. 1495, Thame, Oxfordshire

Died: in or after 1549, England?

Ágnes Juhász-Ormsby

Department of English, Memorial University of
Newfoundland, St. John's, NL, Canada

Abstract

The Welsh humanist scholar, poet, and educator Leonard Cox is remembered mostly for his involvement in Erasmian circles in Poland and the Kingdom of Hungary, as well as his contribution to the educational and religious reforms of the 1530s and 1540s in England. During his extended stay in Central Europe, he was instrumental in disseminating Erasmus's and Melanchthon's works, and his publications include educational treatises, editions of and commentaries on classical and Neo-Latin authors, and occasional poetry addressed to prominent figures associated with the University of Kraków and the Polish court of Sigismund I. After returning to England, Cox became an evangelical reformer and continued, with lasting effect, popularizing continental humanist ideas in the vernacular through his English translation of Erasmus's *The Paraphrase of Erasmus Roterdame upon the Epistle of Saint Paule unto His Discyple Titus* and his *The Art or Crafte of Rhetoryke*, the first English rhetorical handbook based on Melanchthon's *Institutiones rhetoricae*. Through his ambitious, though incomplete, translation project which meant to cover other works by Erasmus, Cox intended to expand his educational mission not only to grammar schools but also to the general public of the newly reformed English commonwealth.

Alternate Names

Coxus, Leonardus

Biography

Although Cox's place of birth cannot be ascertained from extant documents, his matriculation record at the University of Tübingen suggests that he was born around 1495 in Thame, Oxfordshire, to a family of Welsh descent. His early education in England is similarly shrouded in mystery. He may have studied at the free school at Reading, where he would later return as schoolmaster, before he set out on his lengthy peregrination on the continent, which started in the early 1510s and lasted until his return to England around 1529. According to the English humanist, antiquarian, and royal librarian, John Leland's encomium, Cox had spent some time in Paris, likely in the early 1510s. Cox may have attended the University of Paris, where he likely befriended the English humanist and linguist John Palsgrave and the French scholar, engraver, and first royal printer Geoffroy Tory, whose scholarly activities he would later commend in two poems appended to Palsgrave's French grammar and English-French dictionary, *Lesclarissement de la langue francoyse* (1530). Cox's edition of Jerome's *De virginitatis custodia* (Cox 1519) further attests that he continued to nurture friendships established in Paris, particularly with Henri Estienne the Elder, the Parisian scholar-printer, after leaving France. The most formative influence on his education came from his professors at the University of Tübingen, where he matriculated on 12 June 1514. He studied under the grammarian Georg Simler, the astronomer Johann Stöffler, and most importantly the *Praeceptor Germaniae*, the humanist scholar and reformer Philip Melanchthon, the main inspiration for his later works published in England (Murphy 2015).

Having earned a B.A. in 1516, Cox arrived, most likely via Prague, in Kraków, where he registered at the Jagiellonian University on 24 September 1518, styling himself, like his friend from Tübingen, Johannes Alexander Brassicanus (later professor of rhetoric in Vienna), as *poeta laureatus*. In his widely successful inaugural university oration, *De laudibus celeberrimae Cracouiensis Academiae* (Cox 1518a), Cox attributed special place to rhetoric,

poetry, and astronomy among the disciplines. He subsequently lectured on Livy and the letters of Jerome at the Jagiellonian University (Ryle 2003). As one of the chief promoters of Erasmus's works and methods in Kraków, Cox was deeply involved in the intellectual circles around the Polish court of Sigismund I and was associated with and patronized by such prominent civil and ecclesiastical figures as the royal secretary Justus Ludovicus Decius; the vice-chancellor, later bishop of Kraków, Piotr Tomicki; the poet and writer, and later primate of Poland, Andrzej Krzycki; the grand chancellor Krzysztof Szydłowiecki; as well as Tomicki's political rivals, Jan Łaski Junior, the later reformer, and Jan Łaski Senior, the royal secretary and primate of Poland (Glonski 2007; Zins 1973, 1994). On the invitation of his humanist friend, Johann Henckel, Cox interrupted his stay in Kraków in 1520 to become schoolmaster first in the town school of Lőcse (Leutschau, Levoča, Slovakia) and in 1521 in Kassa (Kaschau, Košice, Slovakia) then both lying within the Kingdom of Hungary. Cox's publications during his sojourn in Central Europe, his most productive period, reflect the marked influence of Italian educational theorists and Erasmus, with whom he exchanged letters in 1527 (Epistles 1803, 1824, 1826; Fantazzi 1974). Following his return to Kraków in 1526, a number of Cox's educational treatises and grammatical handbooks intended for students in grammar schools appeared in print: *Libellus de erudienda iuuentute* (Cox 1526a), the probably spurious *Methodus humaniorum studiorum* (Cox 1526c), and an edition of Donatus's *Grammaticae methodus* and *De octo orationis partibus libellus* (Cox 1526b). Cox's prolific publications in the period, furthermore, include editions of Erasmus's works, such as the anti-Lutheran *Hyperaspistes* (Cox 1526a), Jerome's *Epistola ad Rusticum monachum* (Cox 1518b) and *De virginitatis custodia* (Cox 1519), as well as commentaries on classical and Neo-Latin poets: Statius's *Sylvae* (Cox 1527c), Horace's *Epodon liber* (Cox 1527), Giovanni Pontano's *De laudibus diuinis opusculum* (Cox 1520), and Adriano Castellesi's *Venatio* (Cox 1524) (Breeze 1987–1988; Ryle 1992). Influenced by Erasmus' treatise *De duplici copia*

verborum ac rerum commentarii duo, in his commentaries Cox upheld the stylistic ideals of copiousness or abundance of diction (*copia*), and the purity of Latin style (*puritas*), the latter modelled on Cicero's writings. Cox's commentaries that meticulously explicate the proper meaning of Latin words found both in classical and Neo-Latin poems were intended to enrich the students' vocabulary and help them lay the foundations of an abundant style by fulfilling the prerequisites of *copia rerum et verborum*.

Cox himself composed a number of poems, mostly commendatory verses appended to a variety of publications by his friends, patrons, and associates, which reflect his interests in philosophy, theology, and astronomy. Significantly during this period, Cox was also associated with publications that promoted the use of vernacular languages, and his poems appeared in the leading Kraków printer Hieronymus Vietor's edition of the Dutch educator Johannes Murmellius's *Oratiunculae variae* (Cox 1527b) and *Dictionarius* (Cox 1528), the latter of which contained the first printed Polish dictionary. Cox's only documented contribution to English politics during his continental peregrination is his publication of Luther's epistle to Henry VIII and the English king's response to the reformer, *Epistola Martini Lutheri ad Henricum VIII, Responsio dicti inuictissimi Angliae ac Franciae regis, defensoris fidei, ac domini Hyberniae*, etc. (Cox 1527a), which enhanced the Polish king's image as defender of Catholic faith on the international stage and advanced Cox's own position in royal circles in Kraków (Glonski 2007; Juhász-Ormsby 2012).

In 1529, Cox left Poland and returned to England, presumably because he did not find stable employment at the university or among his private pupils. His first known patron in England, abbot Hugh Cook Faringdon, secured him a teaching position at the abbey's foundation, the free public grammar school in Reading. Although Cox consolidated his appointment at Reading by supplicating for the master's degree in Oxford in 1530, his headmastership was briefly suspended at the time of the dissolution of Reading Abbey in 1539 (Emden 1974; Murphy 2015). It was during

his tenure at Reading that Cox turned to translation and aided the promotion of educational and religious writings by reform-minded humanists in England. While at Reading, he produced his most significant contribution to scholarship, the first English rhetorical handbook, *The Art or Crafte of Rhetoryke* (Cox 1532), which was reprinted within 3 years of its first publication. Cox's elementary rhetoric is largely an adaptation of Melanchthon's *Institutiones rhetoricae* (1521) with added material from Melanchthon's *De rhetorica libri tres* (1519), Cicero's *De inventione*, and his own reading notes. Cox took great pains, however, to remove Melanchthon's name and antipapal sentiments from his rhetoric, thus avoiding any religious associations during the precarious times preceding the English Reformation. Unlike his earlier politically uncommitted publications, Cox's subsequent writings responded directly to the religious and educational reforms prompted by the English Reformation and administered by Cox's new patron, Thomas Cromwell, Henry VIII's secretary and one of the most influential political figures of the 1530s. Cox's translation of *The Paraphrase of Erasmus Roterdame upon the Epistle of Saint Paule unto His Dysciple Titus* (Cox 1534), in particular, demonstrates his acute awareness of the changing political climate. His strongly anti-papal preface provides an overt declaration of his evangelical leanings and reformed position while advancing to the general reader the reformation statutes, especially the controversial Act of Supremacy, which confirmed Henry VIII's status as the supreme head of the Church in England. Cox's choice of publishing Erasmus's paraphrase on Paul's letter to Titus must have been instigated by Melanchthon, who lectured on Paul's epistle in 1518. It also meant to appeal to Cromwell, who was a known sponsor of translations from Erasmus. Although Cox seemed to have intended to dedicate further Erasmian translations, religious and educational, to Cromwell, he never completed the proposed English versions of Erasmus's *Modus orandi Deum* and *De pueris instituendis* and his paraphrase on Paul's first and second letter to Timothy. However, in the dire situation after the dissolution of Reading Abbey and the execution

of Faringdon on charges of high treason in 1539, Cox turned again to Cromwell with an edition of William Lily's and Erasmus' popular Latin grammar, *De octo orationis partium constructione libellus*, published by the king's printer Thomas Berthelet in 1540. Cox considerably expanded Lily's and Erasmus's text with annotations derived from the Westphalian educator Henricus Primaecus's popular commentary, which he supplemented with his own extensive reading notes, explanations, and examples from a wide range of classical and humanist authors. Although its appearance coincided with the royal initiative to produce a uniform grammar for common use in schools throughout the realm, Cox's annotated edition was superseded in the same year by Lily's authorized Latin grammar, *Institutio compendaria totius grammaticae*. Nor was Cox's plan to compose another rhetorical handbook for students' use, under the proposed title *Erotemata rhetorica*, realized. Within months of the publication of Cox's new textbook, Cromwell fell out of power and was executed in July 1540. Notwithstanding Cromwell's fall, Cox was reinstated in a royal patent to his former position as headmaster of Reading school in 1541. In 1546 he sold the patent and left Reading only to reappear as a participant in another important royal project during the reign of Henry VIII's successor, the Protestant Edward VI. In 1549 Cox's translation of Paul's letter to Titus was reprinted in the officially sponsored *The Seconde Tome or Volume of the Paraphrase of Erasmus vpon the Newe Testament*, which was significant in popularizing ecclesiastical reforms and was ordered to be displayed in every parish church in England by the royal injunctions of 1547. According to the testimony of the preface, dedicated to his last known patron, Cromwell's former client John Hales, Cox was a licensed preacher within this period and, due to the preaching ban imposed in 1548, was working on Greek patristic texts by Mark the Hermit at that time. With Hales's imprisonment and subsequent exile shortly after the publication of the *Paraphrase*, Cox also disappears from the records, and nothing can be firmly established about his later life or death. Nevertheless, Cox's last extant publication

confirms that he maintained his association with the English court and was patronized by people who continued to advance religious reforms during the reign of Edward VI (Ryle 2004; Murphy 2015).

Cox's Erasmianism, which placed him at the center of the intellectual circles in Kraków, proved to be an indispensable asset in England and helped him advance his position under both Henry VIII and Edward VI. The career path that eventually led Cox to resign from his headmastership at Reading and to devote himself wholeheartedly to preaching resembles that of evangelical humanist educators who converted their Erasmianism simultaneously into the production of new textbooks and the introduction of humanist methods of instruction into English grammar schools, as well as the spiritual reformation of the English commonwealth (Juhász-Ormsby 2012).

Heritage and Rupture with the Tradition

Cox's early publications, especially his theoretical treatise on the education of youth, *Libellus de erudienda iuventute*, reveal his indebtedness to Italian humanist educators, as well as Erasmus and Melanchthon (Glomski 1998, 2000; Breeze and Glomski 1991). Influenced by Battista Guarini's methods, in *Libellus* Cox emphasized the moral character of the schoolmaster and advocated for a parallel Greek-Latin program in grammar schools. He also adapted Erasmus's recommended list of authors and his guide to textual exegesis in *De ratione studii* (1512), although he delineated a far more rigorous and systematic curriculum than either Erasmus or the Italian pedagogues had. Like Melanchthon, Cox stressed the formation of good grammatical habits, which he demonstrated in his annotated edition of Erasmus's and Lily's grammar *De octo orationis partium constructione*. In his commentary, Cox provides an alternative to the systematically organized precepts of Erasmus's and Lily's grammar, and his notes constitute an encyclopedic manual of the Latin language, illustrating the imitative method of instruction. Following the

Italian humanist Lorenzo Valla and Erasmus, Cox based his study of the Latin language on usage, attributing authority not only to classical writers but also to modern interpreters. Furthermore, Cox assigned a central role to the vernacular in elementary language instruction which led him to produce an English translation of Melanchthon's *Institutiones rhetoricae*. Possibly the first part of an incomplete series, Cox's *The Art or Crafte*, focuses on invention and arrangement and covers the three types of oration with extended, freely translated examples drawn from a broad range of humanist and classical Greek and Latin works, among which Cicero's orations and rhetorical treatises feature prominently (Carpenter 1899; Ryle 2003). Like Melanchthon, Cox stressed the speaker's moral character and the role of dialectic as opposed to stylistic artifice and ornamentation that characterized contemporary school texts composed for elementary rhetorical instruction. Cox's educational handbooks popularized Erasmus's precepts concerning the foundation of an abundant style and Melanchthon's rhetorical theories first in Central Europe then in England, where the Erasmian (and to a lesser degree Melanchthonian) pedagogical ideals would define the Henrician school reforms in the first part of the sixteenth century and would consequently effect a more broadly based education of the general public in the vernacular.

Impact and Legacy

The direct impact of Cox's educational activities and his promotion of the use of the vernacular in preuniversity instruction is most discernible in his disciples' activities in Central Europe. Cox's student in Kassa, the German educator and reformer Leonhard Stöckel's humanist curriculum, founded on Erasmus's and Melanchthon's pedagogical methods, in his school in Bártfa (Bartfeld, Bardejov, Slovakia), would exert considerable influence especially in Lutheran schools within the Kingdom of Hungary throughout the sixteenth century, earning Stöckel the reputation of *Praeceptor Hungariae* (Witt 2008). Similarly, the Hungarian humanist Johannes Sylvester, who

studied under Cox in Kraków and contributed to his edition of *Statius*, would become a pioneering educator and an ardent advocate of the Hungarian language, producing several influential works: Christopher Hegendorf's elementary grammar, *Rudimenta grammatices Donati*, with an Hungarian commentary; a Latin-German-Polish-Hungarian phrase book based on Sebald Heyden's *Colloquia puerilia* (1527); the first Hungarian grammar, *Grammatica Hungarolatina* (1539); and an Hungarian translation of Erasmus's Greek-Latin New Testament, *Újszövetség* (1541) (Breeze 1987–1988). Cox's role in championing vernacular languages is also apparent in his prefatory poems appended to Palsgrave's French grammar, in which he highly praised both Tory and Palsgrave for their promotion of the French language and their call for a systematic vernacular grammar.

Although it is more difficult to trace how his *The Art or Crafte* impacted later rhetorical handbooks, Cox's extensive English commentary that supplemented Melanchthon's rhetorical precepts and adapted the Erasmian commonplace book method and textual analysis would be followed in subsequent educational textbooks intended for English grammar schools, most notably in Nicholas Udall's popular *Floures for Latine Spekinge* (1534) and Palsgrave's rhetorically oriented English-Latin edition of the Neo-Latin play *Acolastus* (1540). It will be Thomas Wilson, Udall's student under the reformed humanist curriculum at Eton College, who would continue Cox's work in producing the first English treatise to provide a comprehensive treatment of rhetoric, *The Arte of Rhetorique* (1553), which he intended for the benefit of the general public. Wilson derived some material from Cox's *The Art or Crafte*, but more importantly, Wilson's work, like that of Cox's textbooks and commentaries, was deeply informed by both Cicero's entire rhetorical corpus and Erasmus's educational writings. Through its numerous reprints and extensive English examples, Wilson's *Arte of Rhetorique* would profoundly affect not only the concepts of rhetorical theory but also sixteenth-century English letter writing and literature in general.

Abstract

In the complex scenario of the Aristotelian tradition during the second part of the sixteenth century in Italy, Cesare Cremonini

is a philosopher who shows a really interesting profile both in his life and in his works. His activity as a university professor took place in two important cities of the Italian Renaissance, Ferrara and Padua, two cruxes in the multifaceted network of centers and peripheries (Burke 1998), where many aspects of early modernity culture were rooted. Furthermore, owing to the specific history of the University of Padua, Cremonini's life is also interwoven with the important city of Venice, the Republic guarantor of a greater degree of freedom, and the scenario of rising libertinism. In the existential and intellectual biography of Cremonini, we see the presence of relevant topics such as: the immortality of the soul, the role of experience in learning, the question of method, and the delicate issue of *libertas philosophandi*. After a long period in which Cremonini's contribution to Renaissance philosophy was confined to an over-easy contraposition with the revolutionary thought of Galileo Galilei (Renan 1852; Mabillean 1881; Berti 1877), the last two decades have shown a new interest for this philosopher (Khun 1996; Poppi 1991, 2000; Muir 2007).

Biography

In some cases, the life of a philosopher is placed *a latere* in respect to the most relevant events of his epoch, while in others the biographies are deeply plunged into the tumultuous becoming of history. The rich life of Cesare Cremonini reflected the second case: an intellectual and a university professor who took part in the cultural and political life of a city as important as Padua and a philosopher under the protection of the illustrious Republic of Venice. Cremonini was born in Cento, a very small town between Modena and Ferrara, politically under the influence of the powerful Este family; we do not know the exact date of his birth, but we do know his day of baptism: December 22, 1550. His mother was Mattea Pilanzi and his father was Matteo; the family was active in painting: his grandfather, Giovan Battista, father, and brother, also called

Giovan Battista, were all painters. We do not have any clear information about the first period of his studies: after the first degree in humanities – traditionally the initial step for entering one of the three big faculties in the sixteenth century – Cremonini chose the faculty of law: after a brief period, however, he left this *cursus studiorum* and devoted himself to philosophy. Probably, these steps of his education occurred in an unknown *Studium* of Ferrara; we know that he was a student of Federico Pendasio (1526–1603), a professor of *Natural philosophy* both at the University of Padua (1565–1571), and at the University of Bologna (from 1571 till his death) (Schmitt 1980; Forlivesi 2012).

Thanks to his doctorate, taken most probably in Ferrara, Cremonini earned the *licentia ubique docendi*, the qualification necessary to teach in universities. During these years, he spent his time in the rich milieu of Alfonso II d'Este's court (1533–1577) in Ferrara, and he became familiar with Giambattista Pigna, Francesco Patrizi, and Torquato Tasso. It is important to remember that Tasso had been a professor of *Mathematics* (1574) in the same faculty of Arts and Medicine where, from 1578 to 1590, Cremonini himself held his courses. In fact, in 1578 his first chair, as professor *straordinario* (adjunct professor) *in secundo loco* (second place) was *Natural philosophy*; from 1581 to 1584, he was both adjunct professor *in primo loco* (first place) and professor *ordinario* (full professor) in second place for the same discipline. From 1584 to 1587, he was only adjunct professor in first place and then until 1589, he was full professor in first place. During his last academic year at the University of Ferrara, Cremonini was appointed to the same chair of *Mathematics* that had belonged to Tasso, an important and relevant task, because the course was centered on the reading and explanation of Euclid's *Sphere*. His life in Ferrara was very successful but not without problems: already during this time, in fact, the philosopher had faced some slanders by his colleagues, a hostility rooted in academic rivalry and, probably, in the very leitmotif of Cremonini's life: the first accusation about his teaching and manner of reading Aristotle's works is proved by a letter,

sent on May 20, 1589, addressed to Duke Alfonso II d'Este (Tiraboschi 1833, p. 475; Schmitt 1984).

On the November 23, 1590, Cremonini was invited with an official decree to teach at the prestigious University of Padua. This date is very important because at that date Cremonini was in a position to take the chair of *Natural philosophy* as professor *in secundo loco*, the place freed by the death in 1589 of Jacopo Zabarella, who had spent part of his life in this position. Following the University's antiprivilege rules, the latter philosopher, born in Padua, could not obtain the most prestigious place, steadily occupied by Francesco Piccolomini, full professor of the same chair but *in primo loco*. Moreover, Zabarella's death was significant for another circumstance as well: in the same year, Girolamo Capizucchi also died. For the Jesuits, this meant the loss of the two most important professors in line with their positions (and their requests) inside the *Studium* of Padua (Muir 2007; Sangalli 2001; Grendler 2002, pp. 479–483). These two elements, a new academic horizon and the relations with the Jesuits, were relevant aspects of the early period of Cremonini's activity in Padua; two official speeches, both in 1591, perfectly represent the philosopher's role in the new *Studium*: the first is the inaugural lesson of his course (January 27, 1571), the second is the discourse held in Venice against the powerful *Gymnasium patavinum* founded by the Jesuits (December 20, 1571). In these two speeches, we can see the rich and complex profile of Cremonini as an intellectual and citizen: a skilful and cultured orator, he had profoundly changed his context and found a new identity in relation to an institution very different from the University of Ferrara. In this city, the *Studium* was strictly linked to the will of the Duke, and in management near to that of a private institution; under the protection of Venice, Padua University was a solid public reality with a greater degree of freedom, where Cremonini was able to develop his career (Schmitt 1980), inside and outside the *Studium*.

After this beginning in Padua, Cremonini's reputation and fame constantly grew: in the academic years 1601–1602, after Piccolomini's retirement, he held the chair of *Natural*

philosophy as professor *in primo loco*, the role that he kept until his death on July 19, 1631, probably due to a lung disease. During this period, we see strong evidence of Cremonini's importance: the increase of his salary from 200 to 2000 florins; his role as an orator on behalf of Cento in the delicate business regarding the victory of Pope Clemente VIII against Ferrara (May 27, 1598); and three times on behalf of the Faculty of Arts and Medicine, the task of making the speech on the occasion of the election of a new *Doge* (1606, 1616, 1618). His public role was also strengthened by his activity inside the *Accademia dei Ricovrati*, where he was elected with Galileo Galilei and Gambattista Pigna in 1600.

Another important chapter in Cremonini's life was his presence in different debates: against Galileo Galilei on the nature of the skies (1605); with Paolo Beni supporting his pupil Giuseppe degli Aromatari against Alessandro Tassoni on Petrarch's heritage (1611–1613); against Giorgio Raguseo about the nature of elements and some points in Aristotle's interpretation (1613); and against Pompeo Caimo about Galenism (1626–1627) (Ongaro 2000). His authority as professor and philosopher earned during his life in Padua, however, did not save him from the harassing attentions of the Inquisition of this city and, of course, of Rome: some relevant studies on these topics (Poppi 1993a, b; Sangalli 1998; Muir 2007) clearly show the tenacity of the Inquisition's attacks against Cremonini. After a first moment of attention in 1599, Cremonini's works and teaching activities were subject to examination seven times: in 1604 (the most recent discovery), 1608, 1611, 1614, 1619, 1622, and 1626. Despite this continuous fight with the Inquisition, Cremonini was very prudent and succeeded in escaping from any humiliating or violent consequence, reinforcing his standing as a masterly intellectual: in this framework, thanks to his teaching activity and cultural influence, Cremonini's legacy is linked to libertinism especially during the seventeenth century; later, also as a result of the *Naudeana et Patiniana* (1701, 1703, p. 56), the posthumous books attributed to Gabriel Naudé and Guy Patin, Cremonini's ironic and shrewd profile was strengthened by the

famous motto ascribed to him: *intus ut libet, foris ut moris* (Kristeller 1968; Bosco 1989; Turner 2003; Cavaillé 2011).

Heritage and Rupture with Tradition – Innovative and Original Aspects – Impact and Legacy

In order to understand Cremonini's contribution to late Renaissance thought, it is necessary to place this philosopher in the problematic and multifaceted scenario of Italian universities in the seventeenth century, with its debates and principal topics. First of all, it is important to bear in mind the prominent position of Aristotelian tradition and its relations with Christian dogma. Whereas in Europe, in France (Paris), and England (Oxford), Aristotle was often utilized in the Faculty of Arts as a first step for studying Theology, during the fourteenth century, the specific situation of Italian Universities and the absence of a strong tradition in this field in *Studia* such as Padua, Bologna, and Pavia favored a separation between natural philosophy, focused on Aristotle's works, and religious faith. Despite the respect for Christian dogma, Italian professors often claimed the autonomy of reason in explaining natural phenomena and the reading and comments of Aristotle's legacy were directed to the study of Medicine: the most common books were *De caelo*, *Physics*, *De generatione et corruptione*, *Parva naturalia*, the so-called *Organon*, *Nicomachean Ethics*, and *Politics*.

During the sixteenth century, as a result of the studies developed in the previous century, a new approach arose: beside the Scholastic tradition, the new humanistic lesson had a powerful impact on university practice. Aristotelian humanism had important supporters such as Niccolò Leonico Tomeo (1456–1531), Angiolo Poliziano (1454–1494), and Ermolao Barbaro (1453–1493), and it promoted new translations in Latin and new editions of the Greek texts, among which the contribution of Aldo Manuzio (1452?–1515) and his typography in Venice played an important role. This new approach created a divide between two ways of reading and interpreting Aristotle: the

first, traditionally linked to Averroes, which recalled the validity of the medieval lesson, and a second manner, focused on the contribution of Alexander of Aphrodisias, which found in the Hellenistic tradition the principal contribution for reading Aristotle. The differences and relations between these two traditions are very complex, also because of reciprocal influences and the different shades within each philosopher, but we could say that Averroes's tradition tended to pantheism and Alexandrian traditions tended more toward a split between a transcendent God and the immanent world (Bianchi 2003). In this context, relevant for the history of North Italy's *Studia*, we must recall the contribution of Pietro Pomponazzi (1462–1525), one of the most important philosophers of the Alexandrian traditions: a pupil of Nicoletto Vernia (1420–1499), Pomponazzi tried to explain the world's order only by human reason and one of his most renowned topics was the immortality of the soul, widely debated in Latin and vernacular treatises during the Renaissance (Sgarbi 2016). His major work, *De immortalitate animae* (1516) was written only 3 years after the papal seal *Apostolici regiminis* (December 19, 1513) by Leone X, where certain Christian dogmas are reaffirmed: the soul truly exists of itself and essentially as form of the human body, it is immortal, created by God and instilled in the body, and each person has his own rational soul. Furthermore, the second part of this papal seal lays down the obligation for university professors to teach these dogmas and to confute every different philosophical argument. With *De immortalitate animi* and *De naturalium effectuum admirandorum causis sive de incantationibus* (1520), Pomponazzi proposed an intrepid approach for questioning world, miracles, and the nature of the soul (Landucci 2006). Although his faith in the Christian dogmas is undisputed, the philosopher attempted a clarification of reality from a rational perspective: the Church affirms the truth and philosophy interprets Aristotle. A rational explanation is applied by Pomponazzi on the soul too, depicting a horizon where recompenses and penances are immanent to mortal life; in this manner, a long philosophical and theological tradition, engaged in a research

inside Aristotle's thought on the question of the immortality of the soul, is undermined causing a strong reaction. *De immortalitate* was burnt in Venice and only the protection of Pietro Bembo and the magistrates of Bologna saved Pomponazzi from dire consequences.

After Pomponazzi's contribution, the topic of the immortality of the soul remained an element of living debate: we could refer to Simone Porta (1496–1554), the author of *De anima et mente humana* (1552), and, most importantly in Padua's context, to Jacopo Zabarella (1533–1589). With a solid education having a hallmark rooted in the new humanistic approach and in agreement with the interpretation of Alexander of Aphrodisias, Zabarella wrote works in an elegant Latin on the interpretation of Aristotle and he confirmed some of Pomponazzi's positions; in particular, in his opinion the soul is the form which gives being to the individual body and moreover, the soul cannot operate without the *phantasmata* given by the perceptive organs and it cannot survive the body's death: the Christian dogmas are not refused, but they are confined to the field of theology. Another important topic debated by Zabarella was the method in the logic field (Zabarella 1578a): his proposal of a *regressus demonstrativus* was a relevant issue in the university's context (Zabarella 1578b). Zabarella and his pupil Giulio Pace (1550–1635) contributed to the diffusion and success of the Aristotelian tradition of Padua in Europe.

A last element of interest for understanding the cultural scenario of Padua is to be found outside the University, in the fragmented horizon of *Accademie*: Of particular importance, this features the activities of the *Accademia di Infiammati* and of one of its members, Alessandro Piccolomini (1508–1579). Engaged in the defence and promotion of the vernacular, Piccolomini and the *Infiammati* achieved many important translations and new works in particular devoted to topics not sufficiently present in the university curriculum, such as rhetoric, poetry, and moral philosophy. In this sense, his adaptation of the *Nicomachean Ethics* was relevant to the new civil context, *De la istituzione di*

tutta la vita dell'uomo nato nobile e in città libera (Piccolomini 1542, 1560).

In the versatile profile of Cremonini, all these elements are present. Already in Ferrara, with his familiarity with Francesco Patrizi (1529–1597) and the dynamic milieu of the Este court, Cremonini had a foretaste of the *libertas philosophandi* enjoyed by the previous generation of Italian philosophers such as Pomponazzi and, in a different manner, Patrizi. During the Counter-Reformation, however, the Church engaged in a conflict to re-establish orthodoxy: its fight was against the Platonism of philosophers like Patrizi, Francesco Giorgi, and Agostino Steuco in favor of peripatetic philosophy, but it was also fueled by the intention to restrict freedom in interpreting Aristotle. In this sense, the Church was not inclined to accept the split between faith and natural philosophy anymore, reaffirming the position articulated in the papal seal *Apostolici regiminis*. In Padua, during Cremonini's life, these religious intentions were summarized by the work of Antonio Possevino (1534–1611), *Biblioteca selecta* (Possevino 1593), in which some opinions were considered particularly dangerous such as: «mundum esse ingenitum, animos mortales, Deum non curare res humanas».

In 1590, when he arrived in Padua, it is easy to understand Cremonini's delicate situation: as professor of *Natural philosophy*, his course was once more supervised by the Inquisition and, in order to face this obstacle, the choice of Cremonini was a continuous play of prudence and erudition. This feature is perfectly represented by his inaugural speech of January 27, 1591: Cremonini introduced himself as a philosopher and humanist through a wide range of literary and philosophical citations, linking his image with a noble tradition of inaugural oration typical of the humanistic approach. Furthermore, his humanistic education and his attention to literature were shown also in his poetical works written throughout his life (Cremonini 1590, 1622). The framework of his speech is the perpetual *motus* which rules reality, a powerful movement wherein all elements of the world are dragged «mundus nunquam est, nascitur semper et moritur» (Cremonini 1591).

In this *motus*, the human being is the problematic microcosm illustrated with references from Plato, Dante, and Petrarch, without any mention of Aristotle, showing a strategic solution for bypassing the attention of the Inquisition and of some hostile colleagues. Nevertheless, his approach did not protect him from the attacks of his adversaries: the success of his courses and the rigour of his interpretation of Aristotle's work took him far away from the Christian lessons about peripatetic philosophy. In his works, Cremonini went further than Zabarella: for the philosopher of Cento the world is not created by God and the sky's movement is caused by the desire toward God. Against Averroes' idea of a unique intellect, Cremonini finds in this reality the principle of differentiation between the human being and other animals and the connection between soul and body is guaranteed by innate heat, which is placed in the heart (Cremonini 1626).

Cremonini's interpretation of Aristotle led him toward the affirmation of the mortality of the soul; this element, together with the other positions about the peripatetic philosophy, must be placed in a moment of conflict between the Padua *Studium* and the Jesuits.

This aspect is almost inseparable from Cremonini's philosophical works and teaching activity: today, we know that Cremonini was, in fact, one of most determined rivals of the Jesuits, a contrast which was not limited to academic disagreements. In Padua, a cultural vision and the influence on young people of the aristocracy and the upper class are at stake: indeed, in that period, Padua's *Studium* was one of the most important – and wealthiest – Universities in Italy, for its liberal and antiprivilege rules as well as because it was under the protection of Venice. In 1589, the Jesuits' College, one of those first established in 1542, expanded until it had 450 students among which 70 from the aristocracy (Muir 2007). After 2 years of harsh conflict in which Cremonini played an important role, in 1591 the Venetian Senate declared that only Jesuit novices could attend the courses in the Jesuits' College. Between 1591 and 1606, when Jesuits were banned from Venice's territory, the attacks conducted by Jesuits

became increasingly intense; during these years, the first accusations against Cremonini were made: the first, possibly in 1599, but the trial has still not been ascertained, and the second in 1604, in which the names of Cremonini and Galilei were linked together. This second accusation is interesting because both the opinions and the teaching of the two philosophers were brought to the Inquisition's attention; this attack had been prepared at three separate times: the first, certain Jesuit sermons inviting citizens and students to denounce any ideas in the odor of heresy (March 3, 1604); the second, a denunciation of Cremonini by one of his colleagues Camillo Belloni (April 12, 1604); the third, another denunciation against Galilei made by Silvestro, another colleague (April 21, 1604) (Poppi 1992). The elegant and clever defence that Cremonini presented to the *Signoria* of the Republic was a plea for the civic value of culture, denouncing the subterfuges concocted by Jesuits. Furthermore, we see Cremonini's willingness to explain his position even in front of the tribunal of the Inquisition in Rome in order to dispel any doubts about his conduct, because: «La cosa è di tale importanza, che non solo a persone di qualche grado si conviene mancar di colpa, ma del sospetto della colpa» (Cremonini 1998, p. 108). On this occasion, we observe Cremonini's particular strategy for facing the criticism of his interpretation of Aristotle: the philosopher accepted only the authority of Venice's Senate, avoiding every claim made by the religious power. The Jesuits employed an interpretation designed to link Aristotle's doctrine to Christian dogma, proposing lessons where Aristotle's original works were not used. On the contrary, with a different approach linked to humanistic tradition, Cremonini and many professors in *Palazzo del Bo*, the principal location of Padua's *Studium*, proposed a method founded on an ideal of education addressing the formation of a citizen of the Venetian Republic and guided by sceptical doubt. On the occasion of this first trial and on similar occasions later, the protection guaranteed by Venice preserved Cremonini from any serious persecution. After all, during the same period, there was another strong supporter of the

Republic living in Venice: Paolo Sarpi (1552–1623), who devoted an important part of his work to defending an education guided by the ideals of civic humanism. A similar outline of the trial which took place in 1604 occurred for the famous accusation of 1611, where once again Cremonini and Galilei came under attack: «Videatur an in processu Doctoris Caesaris Cremonini sit nominatus. . . Galileus philosophiae et mathematicae professor» (Berti 1878; Poppi 1992). And once again, the *libertas patavina* saved Cremonini from the Inquisition's darts. The philosopher's trust in Venice's protection is perfectly represented by his famous affirmation full of regret, quoted in a letter from Paolo Gualdo to Galileo (July 29, 1611): «Oh quanto harebbe fatto bene anco il Sr. Galilei, non entrare in queste girandole, e non lasciar la libertà patavina».

Cremonini's most significant books of this period come within this conceptual and political framework; among these, particularly *Disputatio de coelo* (1613) represented a relevant case. This book was published 1 year after another Jesuit defeat, in 1612, when Venice forbade every citizen of its territory from sending his sons to Jesuit schools. Despite his reactionary character (Muir 2007), this work represented a specific approach to humanistic culture: Cremonini promoted philosophy as a research without guarantee of certainty, a discipline which can expose only possible truths. These assumptions are rooted in the same double-truth of Pomponazzi but applied to a different context, where the *libertas philosophandi* is more difficult and dangerous; in this sense, the dedication to Niccolò Donato, reformer of Padua's *Studium*, is very significant: a clear statement of Cremonini's political and cultural affiliation. This book engendered a complex debate made of accusations and clever responses by Cremonini (1616), but there is another element of great interest: the attention to method. This topic, object of debate in Padua till Zabardella's contribution, was not a novelty in Cremonini's reflection; already in 1596, the philosopher had written the *Tractatus de Paedia* (Cremonini 1596). The treatise was created as an introduction for his course dedicated to Aristotle's *De physico*

auditu, but, on this occasion, Cremonini proposed a radical method rooted in the heuristic function of experience for natural philosophy, ethics, and theology. In this manner, Cremonini refused abstract logic such as that of mathematical demonstration and opened the way for a method more sceptical than the systematic doubt of Descartes' future lesson in *Discours de la méthode* (1637) (Kessler 1997; Vasoli 2007).

Another element of interest in the *Tractatus de Paedia* is the relation between professor and student: unlike the Jesuits' approach, for Cremonini this relation is founded on reciprocity and election. The reciprocity is guaranteed by the use of Socratic dialogue as a better method of teaching, the election is found in the conviction that not everyone can learn everything (Muir 2007): the *Paedia* is a method for building a learning community that has the features of the *Respublica literaria* of which Cremonini was a noble member. In this context it is necessary to place the philosopher of Cento, who had responded to every accusation by saying that his affirmations were made «ex Aristotelis doctrina deinde secundum veritate». In the harsh time of the Thirty Years' War, his complex relation with civic power and religious doctrine was a model for the following generation of intellectuals: a difficult harmony between public adhesion to common sense and private freedom, a polyphony which is near to the *arrière-boutique* of Michel de Montaigne, another philosopher who had focused on the heuristic and sceptical power of experience. It is not surprising that in 1630 a group of Cremonini's students founded the *Accademia degli Incogniti*, which openly embraced libertinism. And this is the portrait of Cremonini that the seventeenth century preserved thanks to the work of authors such as De Silhon (1634), La Mothe Le Vayer (1637), Naudé (1644), and Crasso (1656).

Crescas, Chasdai

► [Crescas, Hasdai ben Judah](#)

Crescas, Hasdai ben Judah

Born: Barcelona, circa 1340

Died: Saragossa, 1410–1411

Shalom Sadik

Ben Gurion University of the Negev, Be'er Scheva, Israel

Abstract

Rabbi Hasdai Crescas was the head of the Jewish community of Aragon, and in some ways, all of Hispanic Jewry. Crescas was one of the leading rabbinic authorities of his time, the political leader of the Jews of Aragon, and a philosophical polemicist against Christianity. As one of the main medieval Jewish philosophers, Crescas critiqued the radical Aristotelian philosophy of Maimonides along with some of Maimonides' Averroist philosophical heirs. Crescas denounced the various Aristotelian opinions as contradicting not only the Jewish tradition but also the true empirical and rational understanding of the world. By assembling adducing traditional Jewish opinion, the diverse Aristotelian sources, the neoplatonic thought of the apostate Abner of Burgos, and the new science of scholastics of the fourteenth century, Crescas succeeded in at

creating one of the most original philosophical opinions and critiques of Aristotelianism belonging to the medieval period: the *Or Hashem*. This seminal work, an oeuvre of both Judaic thought and criticism of Aristotelian science, spurred the growth of the new science of the modern period, which started in the fourteenth century.

Alternative Names

[Don Hasdai Crescas](#); [Crescas](#), [Chasdai](#)

Biography

R. Hasdai was born around 1340 in Barcelona to a prominent Jewish family of merchant and rabbis. By the year 1370, Crescas was a proficient young scholar, a Talmudist, and a judge in Barcelona. Following the death of Rabbi Nissim of Gerondi, Crescas and his friend Rabbi Isaac bar Sheshet (Ribash) became one of the main Jewish authorities of Aragon, and possibly of all Spain. In 1389, Crescas left Barcelona and became the rabbi of the capital of the crown of Aragon: Saragossa. A year later, the King and Queen appointed him as the highest judge of all the Jews in the crown and bestowed him with a high degree of authority over the Jewish community. The pogroms of 1391 had a decisive influence on Crescas' life. In those pogroms, thousands of Jews perished and many converted to Christianity. The pogroms began in Castilla, but the rioters crossed the Aragon border. Almost half of the Jews of Spain after 1391 became Christian. Aragon's important Jewish communities in Barcelona, Valencia, and Gerona vanished. One of Crescas' sons died in Barcelona. After these events, Crescas became the leader of the Spanish community in its fight to survive. With the help of John I King and his Queen Violant of Bar, he tried to restore the Jewish community of Barcelona (without success). He helped *converso* Jews who wanted to come back to Judaism to leave Spain for Muslim countries in North Africa. He ultimately wanted to find a safer place for the Spanish Jews, possibly in the Kingdom of Navarre. Until his death late in 1410 or in

January of 1411, Crescas remained the spiritual head of Spanish Jewry.

Works

We know of three works composed by Crescas:

- (I) An untitled philosophical sermon on Pass-over. The principal subjects of this work are miracle-based faiths and free will.
- (II) A book known by the title *Refutation of Christian Principles*. In this book, Crescas offers a philosophical critique of ten principles of the Christian faith: (1) original sin; (2) salvation; (3) the Trinity; (4) incarnation; (5) the virginity of Mary; (6) transubstantiation; (7) baptism; (8) the coming of the Messiah; (9) the new laws; and (10) demons.
- (III) His major work, the *Or Hashem (The Light of the Lord)*. This book deals with the main subjects of Jewish philosophy. The structure of *Or Hashem* is based on a hierarchical arrangement of Jewish dogma opposed to the Maimonides thirteen principles of faith. Crescas separates his book into four different essays: (1) the existence of God; (2) six foundations of the law; (3) obligatory beliefs; (4) beliefs for which the Torah does not clearly establish what the correct opinions are.

Major Opinions

One of the more notable and enduring contributions of Crescas to the history of philosophy is his critique of Aristotelian science. This critique takes place in the second part of the first essay in *Or Hashem*. Crescas's opinions regarding natural science reflect the influence of the new Christian physics of the fourteenth century. Another key source of Crescas's scientific thinking appears to be the lost book by Abner, *The New Philosophy*. But in this case, as in others, Crescas weaves together different sources and utilizes them freely in an effort to build one unified opinion. These critiques include arguments in favor of the existence of a void, a new definition of matter without dimension, and the definition of "place" as a part

of the dimensions that a body occupies within the infinite expanse of the universe.

Crescas also argues that the Aristotelian proofs for the existence of God are inaccurate due to their errant physical bases. Crescas believed that he had a proof for the existence of God, but not for His uniqueness. For to understand the true uniqueness of God, one must learn it via divine revelation. This conclusion is very important because he implies that the believer has a better understanding of God than the philosopher does.

Crescas was the first Jewish philosopher to argue for a deterministic view of the world. His main sources are Averroes and the Jewish apostate Abner of Burgos. According to Crescas, humans can choose between different possible options, but their relation to external causes determines their choices.

Regarding the topic of the soul's essence, Crescas holds a Platonic opinion: The soul naturally continues its life after its separation from the body. Crescas seeks to prove that the soul and not the mind holds the potential for knowledge. He argues that the true goal of the soul is not rational knowledge but love of God. This is a very important move against the elitist opinion of the Aristotelians (especially Maimonides). According to Crescas, philosophical (and religious) learning is only one way, and inferior at that, to love God. The best way to love God is the practicing of the commandments with religious fervor, which, it should be noted, is an easier path for the mass of the people.

Impact and Legacy

Crescas exercised an important influence upon the Jewish community of his time, and indeed, the major leaders of the next generation of Spanish Jewry were his disciples. However, and quite ironically, the majority of Crescas's students did not adopt his philosophical opinions. Thus, his main philosophical influence was mediated through Pico della Mirandola and Spinoza, who espoused a number of his critiques of Aristotelian science, in addition to several of his definitions of God's attributes as well as his opinions on determinism.

Croatian Renaissance Philosophy

Luka Boršić, Pavel Gregorić and
Ivana Skuhala Karasman
Institute of Philosophy, Zagreb, Croatia

Abstract

Turbulent political situation and no continuity of organized philosophical activity on the territory of the present-day Croatia in the Renaissance period allow only for an overview of individual philosophers who originated from that territory, or conducted their philosophical activities there, between the fifteenth and the seventeenth century. A few of these thinkers were influenced by the cultures of Central Europe, but most came from the coastal area which belonged to the Italian cultural and political sphere, especially that of the Republic of Venice. Most philosophers in this entry received their education and pursued their careers abroad, in cities of Italy and other European centers. Biographies, achievements, and main works of these thinkers are grouped into four topographic sections: (1) the continental area, (2) the northern coastal area, (3) central Dalmatia, and (4) south Dalmatia, in particularly the Republic of Dubrovnik. Within each section, philosophers are listed in chronological order. Philosophers of wider renown are mentioned briefly, mainly to situate them in this context and to refer the reader to the corresponding biographical essays.

Biographies, Achievements, and Main Works of Croatian Renaissance Philosophers

The Continental Area

Apart from ► [Giulio Camillo Delminio](#), who originates from Tomislavgrad (Lat. Delminium) in present-day Bosnia, and ► [Pavao Skalić](#), who was born in Zagreb, the continental area saw few philosophers in the Renaissance. One person of

note was **Andrija Dudić** (Andreas Dudith; Buda, 1533 – Wrocław, 1589), whose father comes from Orhehovica near Čakovec. He was educated in Buda, Wrocław, Brussels, and Paris, and he travelled widely as a Church diplomat. Dudić was appointed bishop of Knin in 1562 and of Pecs in 1563, the position which he held until his conversion to Protestantism in 1567. After a diplomatic career, he retired to Wrocław in 1579, where he composed most of his works and maintained cordial correspondence with notable antitrinitarians. He wrote on astronomy (*De cometarum significatione commentariolus*, 1579), history, rhetoric, and politics.

Northern Coastal Area

Matija Vlačić Ilirik (Matthias Flacius Illyricus; Labin, 1520 – Frankfurt, 1575) is one of the most influential Protestant theologians of the sixteenth century. After education in Venice, Basel, and Tübingen, he went to Wittenberg, where he received the title of Magister of Liberal Arts. There he befriended ► [Philipp Melanchthon](#), but they soon came into conflict. Melanchthon hoped for a reconciliation with the Catholic Church, whereas Vlačić was resolutely against it. In 1549 Vlačić moved to Magdenburg, where he started working on his 13-volume *Centuriae Magdeburgenses*, a detailed church history. Vlačić's adamant positions contributed to the preservation of Protestantism in its original form. Vlačić taught at the University of Jena from 1557 to 1561, but was expelled for theological conflicts with Melanchthon. Having moved to Regensburg, he argued for a foundation of a Protestant university that would cover Austria, Czechia, and the South Slavic lands. There he wrote a catechism in the Croatian language (1566) and started his most important work, *Clavis scripturae sacrae seu de sermone sacrarum litterarum*, which he continued composing in Antwerp and Frankfurt. Vlačić is considered one of the founders of the interpretative and philosophical method known as "hermeneutics." Of special note is Vlačić's work *De materiis scientiarum, et erroribus philosophiae, in rebus divinis* (1561), in which he explains his understanding of the relation between theology, philosophy, and the liberal arts. He wrote more

than 200 works in Latin and German, most of which remain unpublished in various German libraries.

The most original and influential Renaissance philosopher of Croatian origin is Frane Petrić (Patrizi, Patricius, Patritius; Cres, 1528 – Rome, 1597). He left his native island of Cres at the age of 9, travelled across the Mediterranean, and spent time in Ingolstadt, Venice, Padua, Ferrara, before settling in Rome. Towards the end of his life, he was eager to enter the Society of St. Jerome in Rome, a Croatian confraternity, which required a proof of Croatian origin and probably some knowledge of Croatian vernacular to admit new members.

Marko Antun de Dominis (Rab, 1560 – Rome, 1624) received his early education in Rab, studied at the Croatian College in Loreto and in Padua. He taught mathematics, rhetoric, and philosophy in Brescia from 1592 to 1595. In 1597 he was appointed bishop of Senj and in 1602 he became bishop of Split. Having renounced his clerical duty in 1616, he went to England, where he was awarded a doctorate in theology in Cambridge and elected the Dean of Windsor in 1618. In England he published his main work, *De republica ecclesiastica* (1617–1622) and several anti-Catholic treatises. In 1622 he returned to Rome, where he received formal absolution under Pope Gregory XV. However, Pope Urban VIII ordered the trial of de Dominis to be reopened, followed by his imprisonment. De Dominis was declared guilty post mortem, his body, image, and books being publicly burned in Rome in 1624. As a theologian, he was closer to Protestantism than Catholicism. As a philosopher, he adhered to the scholastic tradition, but also used mathematical and experimental methods in his research. He published two treatises on natural philosophy, *De radiis visus et lucis in vitris, perspectivis et iride* (1611), and *Euripus seu de fluxu et refluxu maris sententia* (1624).

Matija Frkić (Matthaeus Ferchius; Krk, 1583 – Padua, 1669) studied in Bergamo, Padua, and Rome, where he obtained a doctorate in theology. He taught philosophy and theology in Padua, while holding high offices in the Franciscan order in Krk. His main work is *Vestigationes*

peripateticae de quibusdam philosophicis ad mentem Aristotelis (1639), in which he interpreted Aristotle as a thinker who anticipated some central Christian doctrines, such as *creatio ex nihilo*. He responded to criticisms of his work in *Defensio Vestigationum* (1646). Frkić also published a treatise on the life and philosophy of Duns Scotus (*Discussiones Scoticae*, 1638) and a wide-ranging reconstruction of Anaxagoras' cosmological views (*De caelesti substantia et eius ortu ac motu in sententia Anaxagorae*, 1646).

Although of Italian origin, **Antonio Zara** (Aquileia, 1574 – Pićan, 1621) served from 1601 to his death in 1621 as the bishop of the ancient diocese of Pićan (Latin *Petina*, Italian *Pedena*) in Istria. While in Pićan, Zara wrote his encyclopedic work *Anatomia ingeniorum et scientiarum* (1615), in which he connects all forms of talent and knowledge, from magic arts to seven liberal arts, with one of the three cognitive faculties (imagination, intellect, and memory) and presents them systematically in four large “sections” as “members” under a single “head.” The work is followed by a very detailed alphabetical index of subjects.

Central Dalmatia

Although known mostly for his erudite poetry, ► **Marko Marulić** (Marcus Marulus Spalatensis; Split, 1450 – Split, 1524) wrote several books that discuss the fundamentals of Christian ethics and extol Christian virtues, notably *Evangelistarium* (1500), *De institutione bene beataeque vivendi* (1506), and *Quinquaginta parabola* (1510).

Federik Grisogono (Grisogonus, Chrysogonus, Chrisogonus; Zadar, 1472 – Zadar, 1538) studied law, philosophy, and medicine in Padua. In 1507 he obtained his doctorate in philosophy and medicine and was appointed professor of astrology and mathematics in Padua. In 1509, Grisogono returned to Zadar, where he worked as a physician. However, we have evidence of an incident caused by his erroneous astrological prophecies in Venice in 1512. To avoid conviction, he returned to Zadar where he died in 1538. Two of his books were published in his lifetime. *Speculum astronomicum terminans intellectum humanum in omni scientia*

(1507) deals with mathematics and its various sub-disciplines: arithmetic, astrology/astronomy, geometry, and music. The other work is *De modo collegiandi, prognosticandi et curandi febres* (1528), a manual of astrological medicine. This work contained two interesting appendices. In the first appendix (*De felicitate et humana perfectione*), Grisogono claims that astrology, of all human disciplines, contributes most to human flourishing. The second appendix (*De fluxu et refluxu maris*), containing Grisogono's explanation of tides, is his most important contribution to the history of science.

Ivan Polikarp Severitan (Joannes Barbula Pompilius, J. Polycarpus Severitanus; Šibenik, 1472 –? c.1526) received his early education in Rome, then studied philosophy and theology in Ferrara and Bologna. He was appointed to various offices in the Dominican order in Šibenik, Perugia, Ancona, and Rome. He was a humanist polymath who wrote poetry, commentaries on classical authors, local histories, texts on grammar, metric, geology, logic, and theology. He published one work of political and moral philosophy, *Monoregia ex qua conicitur totius humanae vitae modus libri quattuor* (1522).

Fran Trankvil Andreis (Andronicus Tranquillus Parthenius; Trogir, 1490 – Trogir, 1571) was a diplomat, writer, poet, and philosopher. He was educated in Trogir, Dubrovnik, Vienna, Padua, and several other Italian cities. He first taught rhetoric in Leipzig and then embarked on a diplomatic career, serving in Vienna and Istanbul. After a failed diplomatic mission to Turkey, he withdrew to Poland and eventually returned to Trogir in 1550. He published many works in fine Latin style imbued with many references to contemporary events. His main philosophical works are *Dialogus Sylla* (1527), a fictional dialogue between Caesar and Sulla on the best form of government and *Dialogus philosophandumne sit* (1545) in which he defends philosophical lifestyle as a way to increase cognitive capacities and attain happiness.

Faust Vrančić (Verantius, Verancius, Veranzio; Šibenik, 1551? – Venice, 1617) studied in Padua and served from 1581 to 1594 as a secretary to king Rudolph II in Prague, where he

was in contact with Kepler and Brahe. In 1594 he went back to Šibenik and later moved to Italy. In 1598 he acted as a bishop of Chand in Hungary, and later became a Barnabite monk in Rome. Vrančić is most famous for his book on mechanical inventions, *Machinae novae* (1595?). His *Dictionarium quinque nobilissimarum Europae linguarum* from 1595 was a dictionary of five main European languages, expanded with two other languages in the second edition of 1605. As a philosopher, he published two texts: *Logica suis ipsius instrumentis formata* (1608), reprinted with significant changes as *Logica nova suis ipsius instrumentis formata et recognita* in 1616 in which Vrančić argues both against Aristotle (refuting metaphysics) and the humanist logic of Petrus Ramus. His other philosophical text is *Ethica Christiana* from 1610, reprinted in 1616.

South Dalmatia

The earliest philosopher from South Dalmatia who deserves a mention is ► [Nicholas of Modruš](#) (Nikola Modruški, Nicholas of Modrussiensis/Machinensis), born in c. 1427 in Kotor, present-day Montenegro.

Juraj Dragišić (Georgius Benignus; Srebrenica, 1445 – Barletta, 1520) was a philosopher and theologian. He received his initial education in the Bosnian town of Srebrenica, and from 1464 to 1469 he studied theology in Ferrara. While in Rome he joined the intellectual circle around Cardinal Bessarion. He taught philosophy in Urbino, Pisa, and Florence. He was Bishop of Cagli and Archbishop of Nazareth based in Barletta. In 1496 he was living in Dubrovnik. In the trial against the Dominican ► [Girolamo Savonarola](#) he took the side of the defendant with the text *Profeticae solutiones* (1497). In 1512 he wrote *Defensio praestantissimi viri Ioannis Reuchlin* and a treatise on logic *Artis dialecticae praecepta vetera et nova* (1520). His most significant work is *De natura coelestium spirituum quos angelos vocamus* (1499).

Klement Ranjina (Clemens Araneus; Dubrovnik, 1482 – Dubrovnik, 1559) was educated in Dubrovnik and studied theology in Padua, Perugia, and Naples. After returning to Dubrovnik, he joined the Dominican order. He

carried out diplomatic missions for the Pope Paul III and the Habsburgs. Ranjina is the author of several theological treaties, such as *Quodlibet declamatorium* (1541), *Expositio super epistolam Pauli ad Romanos* (1547).

Antun Medo (Antonius Medus Calossius; – Dubrovnik, 1603) was born to a family of Greek immigrants in Dubrovnik, had no formal training in philosophy, and earned a living as a merchant. He was an autodidact who enjoyed encouragement from his younger contemporary Juraj Dubrovčanin. Medo published commentaries on two books of Aristotle's *Metaphysics* (*In librum duodecimum Metaphysicae Aristotelis expositio*, 1598; *In librum septimum Metaphysicae Aristotelis expositio*, 1599), both marked by a close reading of the text, relative independence from other commentators, and reluctance to reconcile Plato and Aristotle. Medo also published a polemical treatise on Porphyry's *Isagoge* (*Quaedam animadversiones in Praedicabilia Porphyrii*, 1600), which he blames for many misunderstandings of Aristotle's philosophy.

In contrast with Medo, ► **Nikola Vitov Gučetić** (Nicolaus Viti Gozzius; Dubrovnik, 1549 – Dubrovnik, 1610) was born to a distinguished patrician family, educated entirely in Dubrovnik but well connected with leading lights in Italy. He was a member of four Academies (two in Dubrovnik and two in Perugia), and he was elected to the position of the Dodge of Dubrovnik seven times. There is no evidence of his interactions with the other two of his contemporary philosophers from Dubrovnik, Antun Medo and Juraj Dubrovčanin.

Juraj Dubrovčanin (Georgius Raguseius; Dubrovnik, 1550 – Padua, 1622) was educated in Venice and Padua, where he studied philosophy, mathematics, medicine, and theology. He taught philosophy in Padua from 1601, competing against ► **Cesare Cremonini**. He published *Peripateticae disputationes* (1613) in which he comments on 24 then controversial issues in Aristotle's philosophy, showing familiarity with a broad range of interpretative traditions and arguing against both Christianizing interpretations of Aristotle as well as blind adherence to his

authority. An early treatise on the elements (*Tractatus de formis elementorum*, 1605), written against Cremonini, was incorporated in the *Disputationes*. Dubrovčanin published a treatise on astrology and other forms of divination (*Epistolarum mathematicarum seu de divinatione libri duo*, 1623), in which he explains phenomena such as magnetism, healing properties of gems and plants, etc., with reference to effluences (*defluxus*) from the heavenly bodies. His unpublished texts include commentaries on the logic of Raymond Lull and on the *Sentences* of Peter Lombard, and *Epistolae morales, dialecticae et mathematicae*.

Marin Getaldić (Marinus Ghetaldus; Dubrovnik, 1568 – Dubrovnik, 1626) was a mathematician, physicist, and philosopher. He received his early education in Dubrovnik. In 1595 he travelled to London with ► **Nikola Vitov Gučetić**. He also travelled in Germany, Belgium, Rome, Paris, and Padua. Getaldić was interested in optical instruments and corresponded with Galileo Galilei. His first book was on physics (*Promotus Archimedis seu de variis corporum generibus gravitate et magnitudine comparatis*, 1601) and the last on mathematics (*De resolutione et compositione mathematica*, 1630). Getaldić's treatise on cosmology, *De sphaera mundi seu cosmographia* is preserved in a single manuscript.

Stjepan Gradić (Stepanus Gradius; Dubrovnik, 1613 – Rome, 1683) studied civil and canon law in Fermo and Bologna, where he obtained a degree in theology. He was a deputy archbishop of Dubrovnik and Dubrovnik's long-standing ambassador to Vatican. He wrote one unpublished treatise on philosophy (*Peripateticae philosophiae pronunciate disputationibus*, ms. c. 1634), in which he provides a comprehensive treatment of Aristotelian logic, physics, and metaphysics. He corresponded extensively with illustrious men across Europe, among others with Honoré Fabri on the subject of probabilism and epistemology. Gradić left unpublished texts on astronomy (*Astronomia geometrica*), natural science (*De acceleratione motus naturalis*), scientific instruments (*De horologis et telescopis*), history and biography.

Heritage and Rupture with the Tradition

Following the standard classification, Croatian philosophers can be divided into three main groups: Aristotelians, Platonists, and Concordists. Those working solely or predominantly in the Aristotelian tradition are Matija Frkić, Juraj Dubrovčanin, Klement Ranjina, Antun Medo, and Stjepan Gradić. Philosophers who embrace the Platonic tradition, often in open opposition to Aristotelianism, are Giulio Camillo Delminio and Frane Petrić. The Concordists, who combine or switch between different traditions, are Pavao Skalić, Federik Grisogono, and Nikola Vitov Gučetić.

Some Croatian Renaissance philosophers were engaged in religious disputes of their times, mostly concerned with the rise and spread of Protestantism. Matija Vlačić Ilirik contributed greatly to Protestant doctrines, especially to Biblical exegesis. Dudić and de Dominis converted to Protestantism, whereas Juraj Dragišić, Nikola Vitov Gučetić, and Faust Vrančić openly defended Catholicism. Pavao Skalić switched sides several times over.

Several Croatian philosophers of the Renaissance period tapped into the topics and ways of thinking characteristic of what came to be known as the Scientific Revolution, notably Antun de Dominis, Marin Getaldić, Stjepan Gradić, and Faust Vrančić. The tension between the old and the new ways of thinking is ostensibly felt in Grisogono's works on astrology.

Innovative and Original Aspects

Frane Petrić was one of the boldest thinkers of the Renaissance. His originality extends from philosophical innovation (e.g., the replacement of the Aristotelian four causes with space, light, heat and fluid, all emanating from God) to philological insights (e.g., the idea that Aristotle's book *Metaphysics* is not a coherent unity, but an assemblage of different treatises) and anticipations of some key aspects of the modern scientific world-view (e.g., the geometrization of space).

Matija Vlačić Ilirik's most influential work, *Clavis scripturae sacrae*, is considered to be the

first hermeneutical encyclopedia of the Bible. In this work, Vlačić Ilirik defends the position that the Bible should be interpreted through itself and by itself, in isolation from other ancient texts as much as from the established exegeses.

Pavao Skalić, with his work *Encyclopaedia seu Epistemon*, stands at the beginning of a long tradition of authors who aimed to provide a comprehensive account of all knowledge. However, he understood knowledge in an indiscriminately broad way and executed his account without much system, which cannot be said for Antonio Zara's *Anatomia*.

Faust Vrančić's *Logica nova* is an original attempt to formulate the principles of logic in logic itself, without any metaphysical, epistemological, or rhetorical underpinnings. For him, logic is formal and analytic, in the sense that he thinks of it as a mere tool of presenting already acquired knowledge, incapable of producing any new insights.

Impact and Legacy

Frane Petrić has been quoted by leading thinkers of the 16th and the seventeenth century, including Johannes Kepler, Jan Amos Komenský, Thomas Hobbes, and Henry More. Pierre Gassendi openly acknowledged Petrić's influence on his thinking about space and atoms, and he was mentioned by Leibniz and Mersenne. However, Petrić's indirect influence may be more significant. One of his followers, and a person who inherited Petrić's chair at *La Sapienza* in Rome, was Jacopo Mazzoni, a teacher of Galileo Galilei. There is an identifiable line of thought that goes from Petrić's philosophy, developed in opposition to Aristotle's, to the mathematization of nature in Galileo.

Matija Vlačić Ilirik is considered one of the founders of hermeneutics by ► [Wilhelm Dilthey](#) and Hans-Georg Gadamer. In his exegetic works he introduced the concept of "scope" (the original intention of a work) and operated with what came to be known as the "hermeneutic circle" (the whole work is understood in terms of its parts, and each part is understood in terms of the whole).

Federik Grisogono's theory of tides in terms of a combination of celestial influences and motions

inherent in the element of water with calculable results, sparked some interest among thinkers of the Renaissance, such as Petrić and ► **Gerolamo Cardano**.

De Dominis' theory of rainbow as a result of refraction of light in the interior of water droplets was praised by Isaac Newton and Christian Wolf and criticized by Christiaan Huygens and Ruđer Bošković.

Faust Vrančić's work *Machinae novae* (1595), containing detailed pictures with accompanying descriptions of 56 different machines and contraptions of new or improved design, including the parachute and the mill powered by tides, had very small circulation at the time, but was later recognized as a major contribution to civil engineering.

Abstract

Ralph Cudworth was an expounder of “Cambridge Platonism.” His main tenet is that natural phenomena cannot be explained only by the principles of mechanism; therefore, the existence of a “plastic nature,” which orders the

world in accordance with divine decrees, has to be postulated. The order of creation, in turn, does not depend only on divine will but also on the essences present in God’s intellect. These essences can be known through the notions innate to human soul, which recollects them by means of its active nature. On this basis, Cudworth opposes the Calvinist and the Hobbesian voluntarism, for which divine will is the only source of natural and moral laws. Hobbes is also attacked as a main expounder of atheism, which Cudworth traces back to the idea that matter alone is the source of any activity and phenomenon. To this idea, Cudworth opposes an argument of the existence of God that foreruns Locke’s.

Biography

Cudworth was born in 1617 in Aller (Somerset), by Ralph Cudworth the elder, fellow of the Emmanuel College of Cambridge, and was educated by his stepfather Richard Stoughton, another fellow of the College. In 1632, he was admitted there as pensioner, and took his BA in 1635 and his MA in 1639. As a student, Cudworth was acquainted with Calvinist theology and with Scholastic philosophy dominating the milieu of the Emmanuel. Moreover, he was introduced to Platonism by his tutor Benjamin Whichcote (Scott 1994, 140–143), whose circle was characterized by anti-Calvinist positions inspired by the Dutch theologian Jacobus Arminius (Carter 2010a, 100–102). In 1639, he became fellow of the Emmanuel, while in 1647 he gave a sermon (Cudworth 1647) at the House of Commons and became Regius Professor of Hebrew and Master of Clare Hall. In the following years, he obtained the doctorate in divinity (1651) and became Master at the Christ’s College (1654). During the Interregnum (1649–1660), he was favored by the patronage of Cromwell’s secretary of state, John Thurloe, and was consulted by Cromwell on the readmission of the Jews in England. He held his position at Christ’s College also during the Restoration, and in 1678 he became prebendary of Gloucester. He died in Cambridge in 1688. The main work published during his life was the *True*

Intellectual System of the Universe (1678), while his *Treatise Concerning Eternal and Immutable Morality* (1731) and *Treatise of Freewill* (1838) appeared after his death. Cudworth was the father of Damaris, known as Lady Masham (Birch 1820; Hutton 1996, 2013, 2015, 148–158).

Innovative and Original Aspects

Together with Whichcote, Henry More, and Anne Conaway, Cudworth was part of the Cambridge Platonists, as he used various Platonic-inspired theories in his philosophy. His overall aim was to counter Hobbes's and Spinoza's materialism, atheism, and determinism, which he traces back to the perversion operated by Protagoras of the atomism of Moses (Cudworth 1996a, book II; Hutton 2008, 147–148) and to the Stoics (Cudworth 1996b, Chaps. 2 and 3; Sellars 2012). The main tenet of his *Intellectual System* is that the phenomena of motion cannot be accounted for only in material terms, i.e., by the principles of mechanism. They are explained by the Platonic-inspired hypothesis of “plastic nature,” which is both an immaterial substance and the summation of the laws of motion by which God teleologically orders the world. This notion discards the idea of a direct action of God on the world (Cudworth 1964, Chap. 3; Jacob 1991; Cunning 2003; Allen 2013; Hutton 2013; Russell 2008, 148–150; Bergemann 2012). It also bears witness of the Stoic notion of *pneuma*, although Cudworth rejects the idea that plastic nature is conscious of itself, as it was for the Stoic conception (Gigliani 2008). To this regard, Cudworth introduced the modern English notion of “consciousness” as the awareness of thoughts and actions (Thiel 1991, 2011, 67–71; Carter 2010b). The idea of plastic nature would later be used by Jean Le Clerc to criticize the atheists and would be attacked by Bayle as it excludes the knowledge of its ends (Le Clerc 1703–1713; Bayle 1737; Simonutti 1993, 1997; Rosa 1994).

Secondly, in the *Intellectual system*, Cudworth addresses the atheism of the materialist positions. He distinguishes between four forms of atheism: *hylozoic* (or “Stratonical,” as

Spinoza's), *cosmoplastic* (or “Stoical”), *atomist* (or “Democritical,” as Hobbes's), and *hylopathian*: the main kinds being the *hilozoic*, according to which matter is alive (as in the cosmoplastic hypothesis), and the *atomist*, for which matter is brute (as in the *hylopathian*, based on forms rather than on atoms) (Cudworth 1964, Chap. 2; Armour 2008; Russell 2008, 148–149; Gigliani 2008). In order to refute atheism, Cudworth develops an argument anticipating Locke's: since something exists from eternity, and it cannot be matter (which has no power to create particular things), God is the eternal being (Cudworth 1964, Chap. 4; Scribano 1989; Russell 2008, 113–119).

The problem of determinism is dealt with in the *Treatise of Freewill* and in the *Treatise Concerning Eternal and Immutable Morality*: to Hobbes's determinism Cudworth opposes the idea of *to hegemonikon*, i.e., the power of self-determination which is the very principle of individuation of the self (Cudworth 1996b, Chap. 16; Hutton 1996), and which he appropriates from Alexander of Aphrodisias (Sellars 2012). Moreover, he criticizes Hobbes' idea of justice as based on convention instead of on a natural justice that precedes God's will (Hutton 2015, 132–133). This criticism entails an attack to the Calvinist theory of the absolute inscrutability of divine will (Passmore 1951, 11–14; Carter 2010a, 100–102; Carter 2011; Attfield 2008), undermining the possibility of morality and of knowledge (Hutton 2001a). Cudworth opposes to voluntarism a theory of morality and knowledge based on Platonic innatism and on the principles of archetype (model) and ectype (copy): in the same way as the world is a copy of a divine model, ideas (including moral principles) are copies of divine ideas or essences, which are before divine will and are recollected by the mind in virtue of its active power (Cudworth 1996a, book 4; Scott 1994; Armour 2008; Hutton 1996). On this basis, Cudworth's idea of morality has been labelled as “rationalist” in eighteenth-century debate between rationalists and sentimentalists, although he admits both the role of reason and passions in motivating right behavior (Cudworth 1969; Darwall 1995, 109–148; Gill 2004; Hutton 2001b).

Cujas, Jacques

Born: 1522

Died: 4 October 1590

Xavier Prévost

Faculté de droit et science politique, Université de Bordeaux, Pessac, Cedex, France

Abstract

Jacques Cujas, French jurist of the sixteenth century, is one of the greatest representatives of the legal humanism. Cujas is a prolific author: his *Opera omnia* represent ten volumes in folio, which concern mainly Roman law, but also canon law and feudal law. He applies a historical method, which represents one of the biggest divide with medieval jurisprudence.

Alternate Names

[Cujacius, Jacobus](#)

Biography

Jacques Cujas was a French jurist, born at Toulouse in 1522, where he did all his studies. When his master, Arnaud Du Ferrier, left the university in 1544, Cujas decided to deepen on his own side his knowledge in classics. However, he did not neglect law, and he became lecturer in charge of Justinian's Institutes at the University of Toulouse in 1547. Since he did not manage to get a chair of Roman law in Toulouse, he left for Cahors, where he succeeded as a professor to Antonio de Goveia in 1554. Then, his career was more on travelling. He stayed in Cahors less than a year, thanks to Margaret of France, Duchess of Berry, who offered him a chair in the renowned University of Bourges, which was then the centre of the legal studies reform. Confronted to the opposition of a part of the university, Cujas resigned himself to leave in 1557. He spent less than two years in the

Cujacius, Jacobus

► [Cujas, Jacques](#)

University of Valence and came back to Bourges in November 1559, after the death of Le Douaren. His first books have then established his reputation. When Margaret of France – become Duchess of Savoy – called him to teach at Turin in 1566, he was already one of the most renowned juriconsults in Europe. But Cujas stayed only a few months in Italy. He was back in Valence in September 1567, covered with honour and money. However, due to a financial conflict, he accepted the offer of the University of Bourges in 1575, after a few months in Paris where the prohibition of teaching civil law was suspended in his favour. Cujas ended his career at Bourges, where he died on the fourth of October 1590, celebrated as the greatest jurist of the time (Berriat-Saint-Prix 1821; Spangenberg 1822). Ten volumes in folio in Latin are the result from this long and brilliant career, which was devoted to the humanist reform of legal studies (Cujas 1658).

Cujas is indeed one of the greatest representatives of legal humanism. More precisely, he belongs to the historicist current of legal humanism, which considers that the concept of evolution is central to legal analysis. The law does not exist in a vacuum but is created within a specific historical context. This approach represents one of the biggest divide with medieval methods. In part thanks to their extensive knowledge of the sources, especially of ancient times, the humanists thus removed the *Corpus juris civilis* from timelessness, underlining the different stages of the construction of the legal system. Cujas's method seeks both to restore the texts in their original version and to take into account the whole history of the texts. To this end, the French humanist uses not only his knowledge of the medieval and modern legal thought but also his vast literary and philosophical culture. So, Cujas might be considered as the first legal historian. Besides this historical reading of the texts, three stumbling points distinguish Cujas from the medieval jurisprudence: the consideration of Greek sources, the better command of the language and the search for a "classical" Latin, and the discovery of interpolations and transcription errors.

Nevertheless, Cujas does not completely break with his predecessors. If, as all the humanists,

Cujas rejects the scholastic method and the authorities, his works borrow some features to the first exegetes of the *Corpus juris civilis*. Especially, he does not hesitate to confirm some interpretations of the glossators and commentators. Indeed, the absence of dogmatism is certainly one of the most distinctive characteristics of Cujas's writings (Prévost 2015).

Maybe, this is one of the reasons of its incredible posterity. Cujas has influenced a great part of the jurists, from the middle of the sixteenth century to the promulgation of the French "code civil". Though he despised authorities, Cujas has become – before his death – the authority, quoted in courts and books. Today, even if his books are no longer read, he is still a reference notably for his editions of the ancient legal sources.

Curione, Celio Secondo

Born: Ciriè, near Turin, 1503

Died: Basle 1569

Lucio Biasiori

Scuola Normale Superiore, Pisa, Italy

Abstract

Celio Secondo Curione was one of the leading philologists of late Renaissance Europe. At the same time, he was a very complex figure from a religious point of view. Exiled from Italy because of his religious positions, he came into conflict with Protestants themselves, who eventually put him under trial for his theory of universal salvation and his tolerant conception of religion.

Biography

Born from a noble family, Curione was educated as a humanist in Piedmont. According to the biography written by his pupil Stupanus in 1570, as a young boy he became familiar with Protestant ideas. After reading Luther's and Melancthon's works, he planned to move to Germany but was caught before crossing the Alps and sent to a monastery, from which he is said to have been expelled for violation of relics.

From that moment, he started a wandering life among the most important centers of Italian religious dissent: from Milan (1526–1528), where he met his future wife, to Casale Monferrato

(1530–1535) and Pavia (1536–1539), where he became professor of humanities at the university. Between 1539 and 1541, he was in Venice, the most attractive city in Italy at that time both from a cultural and from a religious point of view. There he composed the *Pasquino in estasi*, a harsh satire of the Catholicism and a true best seller of the Italian Reformation. First published in Italian in 1542, the work was then translated into Latin, German, Dutch, English, and French and spread out all over Europe during the wars of religion. Forced to leave Venice, Curione took shelter in Ferrara, at the court of the philo-protestant Duchess Renée of France, and then in Lucca, where he survived as a private preceptor.

In 1542, after the reorganization of the Roman Inquisition, he fled with his family to Switzerland, first in Lausanne and then, after a sexual scandal, in Basle (from 1546). There, he was appointed professor of classics at the University and wrote a great deal of grammatical, rhetorical, and pedagogical works, which consecrated him as one of the most prominent humanists of mid-sixteenth century Europe.

The thirst for religious freedom, for which he left Italy, was not satisfied in Switzerland either. On the one hand, he kept working for evangelical propaganda in his native country; on the other, he came into an increasing conflict with protestant dogmatism, as well. Around 1550, he was close to anabaptistic and antitrinitarian opinions, as we can assume both from his works of the period and from his participation to the council of Italian anabaptists in Venice. After John Calvin and the religious authorities of Geneva executed the Spanish humanist and antitrinitarian Miguel Servet (1553), Curione distanced himself over and over from Protestantism for supporting religious tolerance. Right after Servet's death, he collaborated with his friend Sebastian Castellio to the *De haereticis an sint persequendi* (on heretics, whether they are to be persecuted) in which he criticized the punishment for unorthodox religious opinions, raising Calvin's irritated reaction and starting the European debate for religious tolerance. The year after, he published his most theologically engaged work, the *De amplitudine beati regni Dei* (On the Wideness of

God's Holy Kingdom), where he criticized the Calvinist conception of predestination and theorized the universal salvation even for those who did not know anything about the Gospel, such as Pagans, Jews, and inhabitants of the New World. Because of this belief, he was tried by the senate of Basle, but he was eventually able to prove his innocence by means of showing that his opinion was largely shared even by some Fathers of the Church. From that moment, however, he tried to avoid to publicly discuss religious matters and transmitted his ideas through a constant activity as a translator and editor of works from the classical world and from European humanism. After most of his family died in a plague, he withdrew into himself until his death in 1569.

Abstract

Demetrius Cydones (c. 1324–1397) was a dominant intellectual as well as a leading statesman of fourteenth-century Byzantium.

In foreign policy he consistently and unsuccessfully sought the support of Western European powers in the Empire's struggle with the Ottomans. He produced influential Greek translations of Thomas Aquinas, Augustine, and other Latin theologians. The substantial corpus of his correspondence is an important source for the history of the period.

Alternate Names

[Kydones, Demetrios](#)

Biography

The biographical sources for the life of Demetrius Cydones are primarily his own writings, especially his extant letters and autobiographical discourses.

He was born c. 1324 in Thessalonica where he also received his formal education, studying under Nil Kabasilas, among others. After his father's death in 1341, the family estate was destroyed in 1342 during the Zealot uprising, eventually leading D. to turn to his father's friend John Cantacuzenos for protection. When the latter took control in Constantinople in 1347 as Emperor John VI, the young D. assumed the post of *mesazon* (chief minister) at the imperial court. He began at this time to receive instruction in the Latin language from a priest at the Dominican monastery in Pera, though he had not yet embraced Roman Catholicism, as his letter to Barlaam c. 1347 makes clear.

Like his brother Prochorus, D. was hostile to the spread of the doctrines of Gregory Palamas. The official acceptance of Palamism at the Synod of Constantinople in 1351 pushed D. further in the direction of the Latin Church. By this time, D. was studying the works of Thomas Aquinas and, with the emperor's encouragement, began to translate some of them into Greek. By his own admission, D. greatly admired the wisdom, sanctity, and lucid reasoning of Aquinas and, not least, his understanding of the Greek philosophical tradition. To

make Thomas better known to Greek speakers became one of the driving goals of his life.

A renewal of the civil war between John VI and his nephew John V Palaeologus forced John VI to abdicate in December 1354. D. accompanied him into retirement to the monastery of St George in Mangana, and it was in there that D. completed his translation of the *Summa contra gentiles* on Christmas Eve 1354. In the years to come, he was to continue translating Thomas as well as other Latin theologians (Anselm, Gregory the Great, works attributed to Augustine).

In 1356 John V recalled D. to imperial service, again in the office of *mesazon*. Not much later, probably in 1357, D. entered the Latin Church. From then on, his theological position and his foreign policy went hand in hand. He was convinced of the need of a Western crusade against the Turks in order to save the empire and consistently advised the emperor to seek Western support and oppose the Ottomans, a dangerous position to maintain in the circumstances. His speech *On not surrendering Gallipoli* (1370) was aimed against those who sought accommodation with the Turks. The overall failure in obtaining Western aid, along with D.'s close association with the emperor's son (the future Manuel II Palaeologus), in disfavor at the time, eventually led to his fall from the emperor's good graces in 1371, although he returned to the imperial court in 1375. He declined to serve under the usurper Andronicus IV (1376–1379) and eventually resigned from the government of John V around 1386. D. sailed for Venice in 1389/1390, receiving honorary citizenship there in 1391, but later returned to Constantinople, maintaining his friendship with Manuel II (emperor 1391–1425).

With Manuel Chrysoloras he travelled to Italy in 1396, but, as Ganchou has shown, moved to Crete to join members of the Chrysoberges family and died there at the end of 1397.

Heritage and Rupture with the Tradition

A gifted diplomat and sympathetic by nature, D. was able to win the esteem and friendship of both ideological allies and opponents. Highly

literate and educated, keenly interested in politics and theology, D. is in some ways the quintessential Byzantine statesman. Nevertheless, he was a daring nonconformist: implacably opposed to accommodation with the Ottomans, rejecting Palamism as irrational, enthusiastically embracing Latin scholasticism, scornful of prejudice against non-Greek speakers.

Innovative and Original Aspects

Though controversial, D. was a unifier, consistently seeking ecclesial, European, and intellectual unity. He learned Latin well and loved it, rendering Latin works into elegant Greek, translating *ad verbum* and *ad sensum*. A self-declared Thomist before Thomism was quite accepted even in the West, he adamantly maintained the unity of faith and reason.

Impact and Legacy

One may count among D.'s numerous disciples and/or admirers the Chrysoberges brothers, Manuel Chrysoloras, Manuel Kalekas, and even Gemistus Pletho. His most lasting legacy lies in his introducing Aquinas and scholastic modes of argumentation to the Greek East. By the time of the Council of Florence-Ferrara, his compatriots were well acquainted with the Latin positions. The extensive corpus of his extant letters is a substantial source for the latter half of the fourteenth century.

Cydones, Prochorus

Born: 1335, Thessalonica

Died: 1371, Great Lavra on Athos

Denis Michael Searby

Department of Romance Studies and Classics,
Stockholm University, Stockholm, Sweden

Abstract

Prochorus Cydones (c. 1335–1371) was a monk of the Great Lavra on Mount Athos. A prominent anti-Palamist, he was condemned and excommunicated at a Synod in 1368. Younger brother of Demetrius Cydones, he is chiefly known for his anti-Palamite writings as well as for translations of Thomas Aquinas and Augustine.

Alternate Names

[Prochoros Kydones](#)

Biography

The chief sources for the life of Prochorus Cydones are his older brother Demetrius' writings, the *Synodal Tome Against Hieromonk Prochoros Kydones* composed by Philotheos Kokkinos, and P.'s own extant letters.

P. was born in Thessalonica in 1335. His father died in 1341, and the family became impoverished under Zealotic revolutionary rule (1343–49). P. displays the education of a Byzantine humanist of his class. At the age of 15 or 16, he became a monk at the Great Lavra on Mount Athos. There, according to Philotheos, he applied himself “maniacally to the vanity of Hellenic studies.” It is not known how he learned Latin, but he became proficient and was able not only to help his brother in translating the *Summa Theologiae* but also translated other works on his own, among them Augustine's *De vera religione* and *De libero arbitrio*.

After Gregoras' death in 1361, P. emerged as the intellectual leader of the anti-Palamites. Other monks, including his superior Jakovos Trikanas, denounced him to Patriarch Philotheos. “Heretical writings” were found in his possession. P. wrote to Philotheos to defend himself, sending along his refutation of the Synodal Tome of 1351 and (apparently) his treatise *On Essence and Energy*. Instead of proving his orthodoxy, these works convinced the patriarch that P. had fallen into worse errors than either Barlaam or Akindynos.

In late 1367, with characteristic imprudence, P. accelerated his own condemnation by issuing a manifesto (*pittakion*) against the veneration of Palamas as a saint. Philotheos convoked the synod in the spring of 1368 and led the interrogation. The outcome of the trial was determined by P.'s *pittakion* and, especially, by his confusing interpretation of the light of the Transfiguration which appeared to border on an heretical Christology. Thus P. was formally excommunicated and condemned in April 1368. In 1369 John

Kantakuzenos wrote a detailed response to the difficulties (*aporiae*) P. raised in regard to Palamism, claiming that for P., enlightenment came through logic rather than grace. Some years later, Theophanes, the metropolitan of Nicaea, provided more profound replies to the *aporiae* in his *Five Discourses on the Light of Tabor*.

P. died in 1371 at the age of 36. A century later the Kydones brothers were still being condemned in the Synodikon of Orthodoxy in their native city. P. is called a false monk (*pseudomonachos*), a fighter against God and against the light of truth.

Heritage and Rupture with the Tradition

Intelligent and charismatic, P. had the misfortune to be a convinced anti-Palamite in an age of Palamite ascendancy. P.'s opposition to Palamism was socially motivated in part but depended more on his conviction that Palamism went against Orthodox tradition and opened the way to polytheism. P. never expressed a desire to leave the Greek Church and does not seem to have followed his brother into the Latin Church.

Innovative and Original Aspects

Though both brothers translated Aquinas, P. was the one to adopt Thomas' methodology in theology. In *On Essence and Energies*, he freely excerpts from Aquinas in Books 1–5 but presents his own novel ideas on the light of Tabor in Book 6, maintaining the style of the *Summa*. Another work in which he developed his ideas was his treatise on the kataphatic and apophatic ways in theology. P. argued that Christ was free from original sin because he assumed human nature and not a human person and that Christ's light on Tabor was created, though also uncreated, because Christ was both created and uncreated. Though generally following a more Platonist tradition, P. explained deification (*theosis*) in terms of analogy rather than participation.

Impact and Legacy

P.'s Thomistic methodology came to be associated with anti-Palamism, though this was not the case originally. His *aporiae* concerning the theophany stimulated theological discussion and spurred a new debate on the Christian appropriation of pagan philosophy. His translations of Latin authors helped to prepare the way for the Council of Florence.

D

D'Afeltro, Pietro

Born: 1463, Naples

Died: After 1526, probably Naples

Charles Burnett

The Warburg Institute, School of Advanced Study, University of London, London, UK

Abstract

Pietro d'Afeltro was a teacher of philosophy and medicine at the University (Studio) of Naples. He probably belonged to the circle of Giovanni Pontano. He took an anti-Scotist position in philosophy. He published works principally on the *Physics* and *Metaphysics* of Aristotle, accompanied by the Long Commentaries of Averroes.

Biography

Pietro d'Alfetro was born in Naples in 1463. In 1487 he was appointed by King Ferdinand of Aragon to the chair of metaphysics at the Studio of Naples at the age of 24 with a salary of 36 ducats, but within a year the studio was closed because of the baronial wars and the invasions of the French. He (together with his brother Niccolò) became part of the *familia* of cardinal Oliviero Carafa, whom he served as his personal physician and to whom he dedicated his book *De fato* in

1508. During this period he published a *Questio de subiecto naturalis philosophie* (between 1485 and 1490). On the restoration of the studio in 1507, D'Afeltro took up his old position again, teaching alternately philosophy and natural science, this time with a stipend of 50 ducats. He immediately published a series of short texts, including the *Prohemii Averrois in libros phisicorum Aristotelis*, which he said was the result of the demands of students attending his "ordinary" lectures on the *Physics* of Aristotle. At some time he added to his teaching "filosofia de anima," but in 1518 his chair was transferred to that of the "practice of medicine." In 1523–1524 he held the "extraordinary" chair of the "Liber Noni Almansoris" – i.e., the teaching on illnesses from head to toe. While this is the last reference to his teaching in the studio, in 1526 he published his *Lectio prima in Metaphysica et Questiones in duodecim libris Methaphysice* which resumed his early teaching and elicited praise from his colleagues. This text was the culmination of the life-work of d'Afeltro, who must have died shortly afterward.

Heritage and Cultural Affiliation

D'Afeltro was clearly proud of belonging to Naples, whose classical connections he hints at in his description of himself as "Parthenopei Philosophorum ac medicorum minimus" (title of his *Lectio prima in Methaphysica*). His teaching in

the studio coincided with the presence in Naples of Egidio da Viterbo, and among his colleagues were Augustino Nifo; Girolamo Galeota, brother of Francesco Galeota; Cola Santillo, with whom he shared the teaching of philosophy and natural science; and his brother (?) Giulio d'Afelto. The accompaniment of the *Lectio* by eulogistic poems by the Neapolitan writers, Girolamo Carbone, Pietro Gravina, and Pietro Summonte, suggests that d'Afelto was acquainted with members of the Aragonese Neapolitan Academy of Giovanni Pontano. Already in 1483 d'Afelto is mentioned in an epigram addressed by Pontano to Carbone, in which Pontano urges Carbone to bring Afelto to his Accademia. The dedications, however, to the cardinals, Oliviero Carafa and Bernardino Carevajal, were probably due to his function as a learned physician within their households.

Innovative and Original Aspects

As far as we know, d'Afelto wrote no book on medicine. His printed works are on the *Physics* and *Metaphysics* of Aristotle, as commented on by Averroes, with the exception of *De fato*. In his *Questio de subiecto naturalis philosophie*, he asks “utrum ens mobile in quantum mobile sit subiectum naturalis philosophie” and gives the opinions of the Thomists, the followers of Albertus Magnus and Egidio Romano, the “scotizantes,” and the “modernus doctor” Nicoletta Vernia, to conclude that Aristotle's natural philosophy had been handed down erroneously and insufficiently. In his *Lectio prima in Metaphysica et Questiones in duodecim libris Methaphysice*, d'Afelto puts into print, late in life, the lectures he gave 39 years earlier, when he was 24. It consists of an introduction to the history of philosophy and the divisions of science, leading on to the encouragement to students to study metaphysics. This is followed by questions arising out of each of the twelve books of Aristotle's work. The first four questions, each discussed over several pages, are “whether being taken simply, which is shared by God and His creation, is the subject of the science of metaphysics,” “whether it is true that ‘All men naturally desire to know,’” “whether among all the
